

To our customers,

---

## Old Company Name in Catalogs and Other Documents

---

On April 1<sup>st</sup>, 2010, NEC Electronics Corporation merged with Renesas Technology Corporation, and Renesas Electronics Corporation took over all the business of both companies. Therefore, although the old company name remains in this document, it is a valid Renesas Electronics document. We appreciate your understanding.

Renesas Electronics website: <http://www.renesas.com>

April 1<sup>st</sup>, 2010  
Renesas Electronics Corporation

Issued by: Renesas Electronics Corporation (<http://www.renesas.com>)

Send any inquiries to <http://www.renesas.com/inquiry>.

## Notice

1. All information included in this document is current as of the date this document is issued. Such information, however, is subject to change without any prior notice. Before purchasing or using any Renesas Electronics products listed herein, please confirm the latest product information with a Renesas Electronics sales office. Also, please pay regular and careful attention to additional and different information to be disclosed by Renesas Electronics such as that disclosed through our website.
2. Renesas Electronics does not assume any liability for infringement of patents, copyrights, or other intellectual property rights of third parties by or arising from the use of Renesas Electronics products or technical information described in this document. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
3. You should not alter, modify, copy, or otherwise misappropriate any Renesas Electronics product, whether in whole or in part.
4. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation of these circuits, software, and information in the design of your equipment. Renesas Electronics assumes no responsibility for any losses incurred by you or third parties arising from the use of these circuits, software, or information.
5. When exporting the products or technology described in this document, you should comply with the applicable export control laws and regulations and follow the procedures required by such laws and regulations. You should not use Renesas Electronics products or the technology described in this document for any purpose relating to military applications or use by the military, including but not limited to the development of weapons of mass destruction. Renesas Electronics products and technology may not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations.
6. Renesas Electronics has used reasonable care in preparing the information included in this document, but Renesas Electronics does not warrant that such information is error free. Renesas Electronics assumes no liability whatsoever for any damages incurred by you resulting from errors in or omissions from the information included herein.
7. Renesas Electronics products are classified according to the following three quality grades: "Standard", "High Quality", and "Specific". The recommended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below. You must check the quality grade of each Renesas Electronics product before using it in a particular application. You may not use any Renesas Electronics product for any application categorized as "Specific" without the prior written consent of Renesas Electronics. Further, you may not use any Renesas Electronics product for any application for which it is not intended without the prior written consent of Renesas Electronics. Renesas Electronics shall not be in any way liable for any damages or losses incurred by you or third parties arising from the use of any Renesas Electronics product for an application categorized as "Specific" or for which the product is not intended where you have failed to obtain the prior written consent of Renesas Electronics. The quality grade of each Renesas Electronics product is "Standard" unless otherwise expressly specified in a Renesas Electronics data sheets or data books, etc.
  - "Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; and industrial robots.
  - "High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control systems; anti-disaster systems; anti-crime systems; safety equipment; and medical equipment not specifically designed for life support.
  - "Specific": Aircraft; aerospace equipment; submersible repeaters; nuclear reactor control systems; medical equipment or systems for life support (e.g. artificial life support devices or systems), surgical implantations, or healthcare intervention (e.g. excision, etc.), and any other applications or purposes that pose a direct threat to human life.
8. You should use the Renesas Electronics products described in this document within the range specified by Renesas Electronics, especially with respect to the maximum rating, operating supply voltage range, movement power voltage range, heat radiation characteristics, installation and other product characteristics. Renesas Electronics shall have no liability for malfunctions or damages arising out of the use of Renesas Electronics products beyond such specified ranges.
9. Although Renesas Electronics endeavors to improve the quality and reliability of its products, semiconductor products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Further, Renesas Electronics products are not subject to radiation resistance design. Please be sure to implement safety measures to guard them against the possibility of physical injury, and injury or damage caused by fire in the event of the failure of a Renesas Electronics product, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult, please evaluate the safety of the final products or system manufactured by you.
10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. Please use Renesas Electronics products in compliance with all applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive. Renesas Electronics assumes no liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
11. This document may not be reproduced or duplicated, in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products, or if you have any other inquiries.

(Note 1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its majority-owned subsidiaries.

(Note 2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.

Hardware Manual

RENESAS MCU

R8C FAMILY / R8C/3x SERIES

All information contained in this material, including products and product specifications at the time of publication of this material, is subject to change by Renesas Electronics Corp. without notice. Please review the latest information published by Renesas Electronics Corp. through various means, including the Renesas Electronics Corp. website (<http://www.renesas.com>)

## Notes regarding these materials

1. This document is provided for reference purposes only so that Renesas customers may select the appropriate Renesas products for their use. Renesas neither makes warranties or representations with respect to the accuracy or completeness of the information contained in this document nor grants any license to any intellectual property rights or any other rights of Renesas or any third party with respect to the information in this document.
2. Renesas shall have no liability for damages or infringement of any intellectual property or other rights arising out of the use of any information in this document, including, but not limited to, product data, diagrams, charts, programs, algorithms, and application circuit examples.
3. You should not use the products or the technology described in this document for the purpose of military applications such as the development of weapons of mass destruction or for the purpose of any other military use. When exporting the products or technology described herein, you should follow the applicable export control laws and regulations, and procedures required by such laws and regulations.
4. All information included in this document such as product data, diagrams, charts, programs, algorithms, and application circuit examples, is current as of the date this document is issued. Such information, however, is subject to change without any prior notice. Before purchasing or using any Renesas products listed in this document, please confirm the latest product information with a Renesas sales office. Also, please pay regular and careful attention to additional and different information to be disclosed by Renesas such as that disclosed through our website. (<http://www.renesas.com> )
5. Renesas has used reasonable care in compiling the information included in this document, but Renesas assumes no liability whatsoever for any damages incurred as a result of errors or omissions in the information included in this document.
6. When using or otherwise relying on the information in this document, you should evaluate the information in light of the total system before deciding about the applicability of such information to the intended application. Renesas makes no representations, warranties or guaranties regarding the suitability of its products for any particular application and specifically disclaims any liability arising out of the application and use of the information in this document or Renesas products.
7. With the exception of products specified by Renesas as suitable for automobile applications, Renesas products are not designed, manufactured or tested for applications or otherwise in systems the failure or malfunction of which may cause a direct threat to human life or create a risk of human injury or which require especially high quality and reliability such as safety systems, or equipment or systems for transportation and traffic, healthcare, combustion control, aerospace and aeronautics, nuclear power, or undersea communication transmission. If you are considering the use of our products for such purposes, please contact a Renesas sales office beforehand. Renesas shall have no liability for damages arising out of the uses set forth above.
8. Notwithstanding the preceding paragraph, you should not use Renesas products for the purposes listed below:
  - (1) artificial life support devices or systems
  - (2) surgical implantations
  - (3) healthcare intervention (e.g., excision, administration of medication, etc.)
  - (4) any other purposes that pose a direct threat to human lifeRenesas shall have no liability for damages arising out of the uses set forth in the above and purchasers who elect to use Renesas products in any of the foregoing applications shall indemnify and hold harmless Renesas Technology Corp., its affiliated companies and their officers, directors, and employees against any and all damages arising out of such applications.
9. You should use the products described herein within the range specified by Renesas, especially with respect to the maximum rating, operating supply voltage range, movement power voltage range, heat radiation characteristics, installation and other product characteristics. Renesas shall have no liability for malfunctions or damages arising out of the use of Renesas products beyond such specified ranges.
10. Although Renesas endeavors to improve the quality and reliability of its products, IC products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Please be sure to implement safety measures to guard against the possibility of physical injury, and injury or damage caused by fire in the event of the failure of a Renesas product, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other applicable measures. Among others, since the evaluation of microcomputer software alone is very difficult, please evaluate the safety of the final products or system manufactured by you.
11. In case Renesas products listed in this document are detached from the products to which the Renesas products are attached or affixed, the risk of accident such as swallowing by infants and small children is very high. You should implement safety measures so that Renesas products may not be easily detached from your products. Renesas shall have no liability for damages arising out of such detachment.
12. This document may not be reproduced or duplicated, in any form, in whole or in part, without prior written approval from Renesas.
13. Please contact a Renesas sales office if you have any questions regarding the information contained in this document, Renesas semiconductor products, or if you have any other inquiries.

## General Precautions in the Handling of MPU/MCU Products

The following usage notes are applicable to all MPU/MCU products from Renesas. For detailed usage notes on the products covered by this manual, refer to the relevant sections of the manual. If the descriptions under General Precautions in the Handling of MPU/MCU Products and in the body of the manual differ from each other, the description in the body of the manual takes precedence.

### 1. Handling of Unused Pins

Handle unused pins in accord with the directions given under Handling of Unused Pins in the manual.

- The input pins of CMOS products are generally in the high-impedance state. In operation with an unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of LSI, an associated shoot-through current flows internally, and malfunctions occur due to the false recognition of the pin state as an input signal become possible. Unused pins should be handled as described under Handling of Unused Pins in the manual.

### 2. Processing at Power-on

The state of the product is undefined at the moment when power is supplied.

- The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the moment when power is supplied.

In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the moment when power is supplied until the reset process is completed.

In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the moment when power is supplied until the power reaches the level at which resetting has been specified.

### 3. Prohibition of Access to Reserved Addresses

Access to reserved addresses is prohibited.

- The reserved addresses are provided for the possible future expansion of functions. Do not access these addresses; the correct operation of LSI is not guaranteed if they are accessed.

### 4. Clock Signals

After applying a reset, only release the reset line after the operating clock signal has become stable. When switching the clock signal during program execution, wait until the target clock signal has stabilized.

- When the clock signal is generated with an external resonator (or from an external oscillator) during a reset, ensure that the reset line is only released after full stabilization of the clock signal. Moreover, when switching to a clock signal produced with an external resonator (or by an external oscillator) while program execution is in progress, wait until the target clock signal is stable.

### 5. Differences between Products

Before changing from one product to another, i.e. to one with a different part number, confirm that the change will not lead to problems.

- The characteristics of MPU/MCU in the same group but having different part numbers may differ because of the differences in internal memory capacity and layout pattern. When changing to products of different part numbers, implement a system-evaluation test for each of the products.

# How to Use This Manual

## 1. Purpose and Target Readers

This manual is designed to provide the user with an understanding of the hardware functions and electrical characteristics of the MCU. It is intended for users designing application systems incorporating the MCU. A basic knowledge of electric circuits, logical circuits, and MCUs is necessary in order to use this manual.

The manual comprises an overview of the product; descriptions of the CPU, system control functions, peripheral functions, and electrical characteristics; and usage notes.

Particular attention should be paid to the precautionary notes when using the manual. These notes occur within the body of the text, at the end of each section, and in the Usage Notes section.

The revision history summarizes the locations of revisions and additions. It does not list all revisions. Refer to the text of the manual for details.

The following documents apply to the R8C/33T Group. Make sure to refer to the latest versions of these documents. The newest versions of the documents listed may be obtained from the Renesas Technology Web site.

Document Type	Description	Document Title	Document No.
Datasheet	Hardware overview and electrical characteristics	R8C/33T Group Datasheet	REJ03B0311
Hardware manual	Hardware specifications (pin assignments, memory maps, peripheral function specifications, electrical characteristics, timing charts) and operation description Note: Refer to the application notes for details on using peripheral functions.	R8C/33T Group Hardware Manual	This hardware manual
Software manual	Description of CPU instruction set	R8C/Tiny Series Software Manual	REJ09B0001
Application note	Information on using peripheral functions and application examples Sample programs Information on writing programs in assembly language and C	Available from Renesas Technology Web site.	
Renesas technical update	Product specifications, updates on documents, etc.		

## 2. Notation of Numbers and Symbols

The notation conventions for register names, bit names, numbers, and symbols used in this manual are described below.

### (1) Register Names, Bit Names, and Pin Names

Registers, bits, and pins are referred to in the text by symbols. The symbol is accompanied by the word “register,” “bit,” or “pin” to distinguish the three categories.

Examples      the PM03 bit in the PM0 register  
                 P3\_5 pin, VCC pin

### (2) Notation of Numbers

The indication “b” is appended to numeric values given in binary format. However, nothing is appended to the values of single bits. The indication “h” is appended to numeric values given in hexadecimal format. Nothing is appended to numeric values given in decimal format.

Examples      Binary: 11b  
                 Hexadecimal: EFA0h  
                 Decimal: 1234

### 3. Register Notation

The symbols and terms used in register diagrams are described below.

#### x.x.x XXX Register (Symbol)

Address XXXXh

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	XXX7	XXX6	XXX5	XXX4	—	—	XXX1	XXX0
After Reset	0	0	0	0	0	0	0	0

\*1

Bit	Symbol	Bit Name	Function	R/W
b0	XXX0	XXX bit	b1 b0 0 0: XXX 0 1: XXX 1 0: Do not set. 1 1: XXX	R/W
b1	XXX1			R/W
b2	—	Nothing is assigned. If necessary, set to 0. When read, the content is undefined.		—
b3	—	Reserved bit	Set to 0.	R/W
b4	XXX4	XXX bit	Function varies according to the operating mode.	R/W
b5	XXX5			W
b6	XXX6			R/W
b7	XXX7	XXX bit	0: XXX 1: XXX	R

\*2

\*3

\*1

R/W: Read and write.  
R: Read only.  
W: Write only.  
—: Nothing is assigned.

\*2

- Reserved bit  
Reserved bit. Set to specified value.

\*3

- Nothing is assigned.  
Nothing is assigned to the bit. As the bit may be used for future functions, if necessary, set to 0.
- Do not set to a value.  
Operation is not guaranteed when a value is set.
- Function varies according to the operating mode.  
The function of the bit varies with the peripheral function mode. Refer to the register diagram for information on the individual modes.

#### 4. List of Abbreviations and Acronyms

Abbreviation	Full Form
ACIA	Asynchronous Communication Interface Adapter
bps	bits per second
CRC	Cyclic Redundancy Check
DMA	Direct Memory Access
DMAC	Direct Memory Access Controller
GSM	Global System for Mobile Communications
Hi-Z	High Impedance
IEBus	Inter Equipment Bus
I/O	Input/Output
IrDA	Infrared Data Association
LSB	Least Significant Bit
MSB	Most Significant Bit
NC	Non-Connect
PLL	Phase Locked Loop
PWM	Pulse Width Modulation
SIM	Subscriber Identity Module
UART	Universal Asynchronous Receiver/Transmitter
VCO	Voltage Controlled Oscillator

11.7	Address Match Interrupt .....	163
11.7.1	Address Match Interrupt Enable Register i (AIER <sub>i</sub> ) (i = 0 or 1) .....	164
11.7.2	Address Match Interrupt Register i (RMAD <sub>i</sub> ) (i = 0 or 1) .....	164
11.8	Timer RC Interrupt and Flash Memory Interrupt (Interrupts with Multiple Interrupt Request Sources) .....	165
11.9	Notes on Interrupts .....	167
11.9.1	Reading Address 00000h .....	167
11.9.2	SP Setting .....	167
11.9.3	External Interrupt and Key Input Interrupt .....	167
11.9.4	Changing Interrupt Sources .....	168
11.9.5	Rewriting Interrupt Control Register .....	169

12.	ID Code Areas .....	170
12.1	Overview .....	170
12.2	Functions .....	171
12.3	Forced Erase Function .....	172
12.4	Standard Serial I/O Mode Disabled Function .....	172
12.5	Notes on ID Code Areas .....	173
12.5.1	Setting Example of ID Code Areas .....	173
13.	Option Function Select Area .....	174
13.1	Overview .....	174
13.2	Registers .....	175
13.2.1	Option Function Select Register (OFS) .....	175
13.2.2	Option Function Select Register 2 (OFS2) .....	176
13.3	Notes on Option Function Select Area .....	177
13.3.1	Setting Example of Option Function Select Area .....	177
14.	Watchdog Timer .....	178
14.1	Overview .....	178
14.2	Registers .....	180
14.2.1	Processor Mode Register 1 (PM1) .....	180
14.2.2	Watchdog Timer Reset Register (WDTR) .....	180
14.2.3	Watchdog Timer Start Register (WDTS) .....	180
14.2.4	Watchdog Timer Control Register (WDTC) .....	181
14.2.5	Count Source Protection Mode Register (CSPR) .....	181
14.2.6	Option Function Select Register (OFS) .....	182
14.2.7	Option Function Select Register 2 (OFS2) .....	183
14.3	Functional Description .....	184
14.3.1	Common Items for Multiple Modes .....	184
14.3.2	Count Source Protection Mode Disabled .....	185
14.3.3	Count Source Protection Mode Enabled .....	186
15.	DTC .....	187
15.1	Overview .....	187
15.2	Registers .....	188
15.2.1	DTC Control Register j (DTCCRj) (j = 0 to 23) .....	189
15.2.2	DTC Block Size Register j (DTBLSj) (j = 0 to 23) .....	189
15.2.3	DTC Transfer Count Register j (DTCCTj) (j = 0 to 23) .....	190
15.2.4	DTC Transfer Count Reload Register j (DTRLdj) (j = 0 to 23) .....	190
15.2.5	DTC Source Address Register j (DTSARj) (j = 0 to 23) .....	190
15.2.6	DTC Destination Address Register j (DTDARj) (j = 0 to 23) .....	190
15.2.7	DTC Activation Enable Register i (DTCENi) (i = 0 to 3, 5, 6) .....	191
15.2.8	DTC Activation Control Register (DTCTL) .....	192
15.3	Function Description .....	193
15.3.1	Overview .....	193
15.3.2	Activation Sources .....	193
15.3.3	Control Data Allocation and DTC Vector Table .....	195
15.3.4	Normal Mode .....	199
15.3.5	Repeat Mode .....	200
15.3.6	Chain Transfers .....	201

15.3.7	Interrupt Sources .....	201
15.3.8	Operation Timings .....	202
15.3.9	Number of DTC Execution Cycles .....	203
15.3.10	DTC Activation Source Acknowledgement and Interrupt Source Flags .....	204
15.4	Notes on DTC .....	205
15.4.1	DTC activation source .....	205
15.4.2	DTCENi (i = 0 to 3, 5, 6) Registers .....	205
15.4.3	Peripheral Modules .....	205
15.4.4	Interrupt Request .....	205
16.	General Overview of Timers .....	206
17.	Timer RA .....	208
17.1	Overview .....	208
17.2	Registers .....	209
17.2.1	Timer RA Control Register (TRACR) .....	209
17.2.2	Timer RA I/O Control Register (TRAIOC) .....	209
17.2.3	Timer RA Mode Register (TRAMR) .....	210
17.2.4	Timer RA Prescaler Register (TRAPRE) .....	210
17.2.5	Timer RA Register (TRA) .....	211
17.2.6	Timer RA Pin Select Register (TRASR) .....	211
17.3	Timer Mode .....	212
17.3.1	Timer RA I/O Control Register (TRAIOC) in Timer Mode .....	212
17.3.2	Timer Write Control during Count Operation .....	213
17.4	Pulse Output Mode .....	214
17.4.1	Timer RA I/O Control Register (TRAIOC) in Pulse Output Mode .....	215
17.5	Event Counter Mode .....	216
17.5.1	Timer RA I/O Control Register (TRAIOC) in Event Counter Mode .....	217
17.6	Pulse Width Measurement Mode .....	218
17.6.1	Timer RA I/O Control Register (TRAIOC) in Pulse Width Measurement Mode .....	219
17.6.2	Operating Example .....	220
17.7	Pulse Period Measurement Mode .....	221
17.7.1	Timer RA I/O Control Register (TRAIOC) in Pulse Period Measurement Mode .....	222
17.7.2	Operating Example .....	223
17.8	Notes on Timer RA .....	224
18.	Timer RB .....	225
18.1	Overview .....	225
18.2	Registers .....	226
18.2.1	Timer RB Control Register (TRBCR) .....	226
18.2.2	Timer RB One-Shot Control Register (TRBOCR) .....	226
18.2.3	Timer RB I/O Control Register (TRBIOC) .....	227
18.2.4	Timer RB Mode Register (TRBMR) .....	227
18.2.5	Timer RB Prescaler Register (TRBPRES) .....	228
18.2.6	Timer RB Secondary Register (TRBSC) .....	228
18.2.7	Timer RB Primary Register (TRBPR) .....	229
18.2.8	Timer RB/RC Pin Select Register (TRBRCSR) .....	229
18.3	Timer Mode .....	230
18.3.1	Timer RB I/O Control Register (TRBIOC) in Timer Mode .....	230

18.3.2	Timer Write Control during Count Operation .....	231
18.4	Programmable Waveform Generation Mode .....	233
18.4.1	Timer RB I/O Control Register (TRBIOC) in Programmable Waveform Generation Mode .....	234
18.4.2	Operating Example .....	235
18.5	Programmable One-shot Generation Mode .....	236
18.5.1	Timer RB I/O Control Register (TRBIOC) in Programmable One-Shot Generation Mode .....	237
18.5.2	Operating Example .....	238
18.5.3	One-Shot Trigger Selection .....	239
18.6	Programmable Wait One-Shot Generation Mode .....	240
18.6.1	Timer RB I/O Control Register (TRBIOC) in Programmable Wait One-Shot Generation Mode ...	241
18.6.2	Operating Example .....	242
18.7	Notes on Timer RB .....	243
18.7.1	Timer Mode .....	243
18.7.2	Programmable Waveform Generation Mode .....	243
18.7.3	Programmable One-shot Generation Mode .....	244
18.7.4	Programmable Wait One-shot Generation Mode .....	244
19.	Timer RC .....	245
19.1	Overview .....	245
19.2	Registers .....	247
19.2.1	Module Standby Control Register (MSTCR) .....	248
19.2.2	Timer RC Mode Register (TRCMR) .....	248
19.2.3	Timer RC Control Register 1 (TRCCR1) .....	249
19.2.4	Timer RC Interrupt Enable Register (TRCIER) .....	249
19.2.5	Timer RC Status Register (TRCSR) .....	250
19.2.6	Timer RC I/O Control Register 0 (TRCIOR0) .....	251
19.2.7	Timer RC I/O Control Register 1 (TRCIOR1) .....	251
19.2.8	Timer RC Counter (TRC) .....	252
19.2.9	Timer RC General Registers A, B, C, and D (TRCGRA, TRCGRB, TRCGRC, TRCGRD) .....	252
19.2.10	Timer RC Control Register 2 (TRCCR2) .....	253
19.2.11	Timer RC Digital Filter Function Select Register (TRCDF) .....	253
19.2.12	Timer RC Output Master Enable Register (TRCOER) .....	254
19.2.13	Timer RC Trigger Control Register (TRCADCR) .....	254
19.2.14	Timer RB/RC Pin Select Register (TRBRCR) .....	255
19.2.15	Timer RC Pin Select Register 0 (TRCPSR0) .....	256
19.2.16	Timer RC Pin Select Register 1 (TRCPSR1) .....	257
19.3	Common Items for Multiple Modes .....	258
19.3.1	Count Source .....	258
19.3.2	Buffer Operation .....	259
19.3.3	Digital Filter .....	261
19.3.4	Forced Cutoff of Pulse Output .....	262
19.4	Timer Mode (Input Capture Function) .....	264
19.4.1	Timer RC I/O Control Register 0 (TRCIOR0) for Input Capture Function .....	266
19.4.2	Timer RC I/O Control Register 1 (TRCIOR1) for Input Capture Function .....	267
19.4.3	Operating Example .....	268
19.5	Timer Mode (Output Compare Function) .....	269
19.5.1	Timer RC Control Register 1 (TRCCR1) for Output Compare Function .....	271
19.5.2	Timer RC I/O Control Register 0 (TRCIOR0) for Output Compare Function .....	272
19.5.3	Timer RC I/O Control Register 1 (TRCIOR1) for Output Compare Function .....	273

19.5.4	Timer RC Control Register 2 (TRCCR2) for Output Compare Function .....	274
19.5.5	Operating Example .....	275
19.5.6	Changing Output Pins in Registers TRCGRC and TRCGRD .....	276
19.6	PWM Mode .....	278
19.6.1	Timer RC Control Register 1 (TRCCR1) in PWM Mode .....	280
19.6.2	Timer RC Control Register 2 (TRCCR2) in PWM Mode .....	281
19.6.3	Operating Example .....	282
19.7	PWM2 Mode .....	284
19.7.1	Timer RC Control Register 1 (TRCCR1) in PWM2 Mode .....	286
19.7.2	Timer RC Control Register 2 (TRCCR2) in PWM2 Mode .....	287
19.7.3	Timer RC Digital Filter Function Select Register (TRCDF) in PWM2 Mode .....	288
19.7.4	Operating Example .....	289
19.8	Timer RC Interrupt .....	292
19.9	Notes on Timer RC .....	293
19.9.1	TRC Register .....	293
19.9.2	TRCSR Register .....	293
19.9.3	TRCCR1 Register .....	293
19.9.4	Count Source Switching .....	293
19.9.5	Input Capture Function .....	294
19.9.6	TRCMR Register in PWM2 Mode .....	294
19.9.7	Count Source fOCO40M .....	294
20.	Serial Interface (UARTi (i = 0 or 1)) .....	295
20.1	Overview .....	295
20.2	Registers .....	297
20.2.1	UARTi Transmit/Receive Mode Register (UiMR) (i = 0 or 1) .....	297
20.2.2	UARTi Bit Rate Register (UiBRG) (i = 0 or 1) .....	297
20.2.3	UARTi Transmit Buffer Register (UiTB) (i = 0 or 1) .....	298
20.2.4	UARTi Transmit/Receive Control Register 0 (UiC0) (i = 0 or 1) .....	299
20.2.5	UARTi Transmit/Receive Control Register 1 (UiC1) (i = 0 or 1) .....	299
20.2.6	UARTi Receive Buffer Register (UiRB) (i = 0 or 1) .....	300
20.2.7	UART0 Pin Select Register (U0SR) .....	301
20.2.8	UART1 Pin Select Register (U1SR) .....	301
20.2.9	Low-Voltage Signal Mode Control Register (TSMR) .....	302
20.3	Clock Synchronous Serial I/O Mode .....	303
20.3.1	Measure for Dealing with Communication Errors .....	307
20.3.2	Polarity Select Function .....	308
20.3.3	LSB First/MSB First Select Function .....	308
20.3.4	Continuous Receive Mode .....	309
20.4	Clock Asynchronous Serial I/O (UART) Mode .....	310
20.4.1	Bit Rate .....	315
20.4.2	Measure for Dealing with Communication Errors .....	316
20.5	Low-Voltage Signal Mode .....	317
20.6	Notes on Serial Interface (UARTi (i = 0 or 1)) .....	318
21.	Serial Interface (UART2) .....	319
21.1	Overview .....	319
21.2	Registers .....	321
21.2.1	UART2 Transmit/Receive Mode Register (U2MR) .....	321

21.2.2	UART2 Bit Rate Register (U2BRG) .....	321
21.2.3	UART2 Transmit Buffer Register (U2TB) .....	322
21.2.4	UART2 Transmit/Receive Control Register 0 (U2C0) .....	323
21.2.5	UART2 Transmit/Receive Control Register 1 (U2C1) .....	324
21.2.6	UART2 Receive Buffer Register (U2RB) .....	325
21.2.7	UART2 Digital Filter Function Select Register (URXDF) .....	326
21.2.8	UART2 Special Mode Register 5 (U2SMR5) .....	326
21.2.9	UART2 Special Mode Register 4 (U2SMR4) .....	327
21.2.10	UART2 Special Mode Register 3 (U2SMR3) .....	327
21.2.11	UART2 Special Mode Register 2 (U2SMR2) .....	328
21.2.12	UART2 Special Mode Register (U2SMR) .....	328
21.2.13	UART2 Pin Select Register 0 (U2SR0) .....	329
21.2.14	UART2 Pin Select Register 1 (U2SR1) .....	330
21.2.15	Low-Voltage Signal Mode Control Register (TSMR) .....	331
21.3	Clock Synchronous Serial I/O Mode .....	332
21.3.1	Measure for Dealing with Communication Errors .....	336
21.3.2	CLK Polarity Select Function .....	336
21.3.3	LSB First/MSB First Select Function .....	337
21.3.4	Continuous Receive Mode .....	337
21.3.5	Serial Data Logic Switching Function .....	338
21.3.6	$\overline{\text{CTS}}/\text{RTS}$ Function .....	338
21.4	Clock Asynchronous Serial I/O (UART) Mode .....	339
21.4.1	Bit Rate .....	343
21.4.2	Measure for Dealing with Communication Errors .....	344
21.4.3	LSB First/MSB First Select Function .....	344
21.4.4	Serial Data Logic Switching Function .....	345
21.4.5	TXD and RXD I/O Polarity Inverse Function .....	345
21.4.6	$\overline{\text{CTS}}/\text{RTS}$ Function .....	346
21.4.7	RXD2 Digital Filter Select Function .....	346
21.5	Special Mode 1 (I <sup>2</sup> C Mode) .....	347
21.5.1	Detection of Start and Stop Conditions .....	353
21.5.2	Output of Start and Stop Conditions .....	354
21.5.3	Transfer Clock .....	355
21.5.4	SDA Output .....	355
21.5.5	SDA Input .....	355
21.5.6	ACK and NACK .....	356
21.5.7	Initialization of Transmission/Reception .....	356
21.6	Special Mode 2 (SSU Mode) .....	357
21.6.1	Clock Phase Setting Function .....	359
21.7	Multiprocessor Communication Function .....	361
21.7.1	Multiprocessor Transmission .....	364
21.7.2	Multiprocessor Reception .....	365
21.7.3	RXD2 Digital Filter Select Function .....	367
21.8	Low-Voltage Signal Mode .....	368
21.9	Notes on Serial Interface (UART2) .....	369
21.9.1	Clock Synchronous Serial I/O Mode .....	369
21.9.2	Special Mode 1 (I <sup>2</sup> C Mode) .....	370

## 1. Overview

### 1.1 Features

The R8C/33T Group of single-chip MCUs incorporates the R8C CPU core, employing sophisticated instructions for a high level of efficiency. With 1 Mbyte of address space, and it is capable of executing instructions at high speed. In addition, the CPU core boasts a multiplier for high-speed operation processing.

Power consumption is low, and the supported operating modes allow additional power control. These MCUs are designed to maximize EMI/EMS performance.

Integration of many peripheral functions, including multifunction timer and serial interface, reduces the number of system components.

The R8C/33T Group has data flash (1 KB  $\times$  4 blocks) with the background operation (BGO) function.

#### 1.1.1 Applications

Electronic household appliances, office equipment, audio equipment, consumer equipment, etc.

## 1.1.2 Specifications

Tables 1.1 and 1.2 outline the Specifications for R8C/33T Group.

**Table 1.1 Specifications for R8C/33T Group (1)**

Item	Function	Specification
CPU	Central processing unit	R8C CPU core <ul style="list-style-type: none"> <li>• Number of fundamental instructions: 89</li> <li>• Minimum instruction execution time:               <ul style="list-style-type: none"> <li>50 ns (<math>f(XIN) = 20\text{ MHz}</math>, <math>VCC = 2.7\text{ V}</math> to <math>5.5\text{ V}</math>)</li> <li>200 ns (<math>f(XIN) = 5\text{ MHz}</math>, <math>VCC = 1.8\text{ V}</math> to <math>5.5\text{ V}</math>)</li> </ul> </li> <li>• Multiplier: 16 bits <math>\times</math> 16 bits <math>\rightarrow</math> 32 bits</li> <li>• Multiply-accumulate instruction: 16 bits <math>\times</math> 16 bits + 32 bits <math>\rightarrow</math> 32 bits</li> <li>• Operation mode: Single-chip mode (address space: 1 Mbyte)</li> </ul>
Memory	ROM, RAM, Data flash	Refer to <b>Table 1.3 Product List for R8C/33T Group</b> .
Power Supply Voltage Detection	Voltage detection circuit	<ul style="list-style-type: none"> <li>• Power-on reset</li> <li>• Voltage detection 3 (detection level of voltage detection 0 and voltage detection 1 selectable)</li> </ul>
I/O Ports	Programmable I/O ports	<ul style="list-style-type: none"> <li>• Input-only: 1 pin</li> <li>• CMOS I/O ports: 27, selectable pull-up resistor</li> <li>• High current drive ports: 27</li> </ul>
Clock	Clock generation circuits	<ul style="list-style-type: none"> <li>• 3 circuits: XIN clock oscillation circuit, High-speed on-chip oscillator (with frequency adjustment function), Low-speed on-chip oscillator</li> <li>• Oscillation stop detection: XIN clock oscillation stop detection function</li> <li>• Frequency divider circuit: Dividing selectable 1, 2, 4, 8, and 16</li> <li>• Low power consumption modes:               <ul style="list-style-type: none"> <li>Standard operating mode (high-speed clock, high-speed on-chip oscillator, low-speed on-chip oscillator), wait mode, stop mode</li> </ul> </li> </ul>
Interrupts		<ul style="list-style-type: none"> <li>• Number of interrupt vectors: 69</li> <li>• External Interrupt: 7 (<math>INT \times 4</math>, Key input <math>\times 4</math>)</li> <li>• Priority levels: 7 levels</li> </ul>
Watchdog Timer		<ul style="list-style-type: none"> <li>• 14 bits <math>\times</math> 1 (with prescaler)</li> <li>• Reset start selectable</li> <li>• Low-speed on-chip oscillator for watchdog timer selectable</li> </ul>
DTC (Data Transfer Controller)		<ul style="list-style-type: none"> <li>• 1 channel</li> <li>• Activation sources: 22</li> <li>• Transfer modes: 2 (normal mode, repeat mode)</li> </ul>
Timer	Timer RA	8 bits $\times$ 1 (with 8-bit prescaler) Timer mode (period timer), pulse output mode (output level inverted every period), event counter mode, pulse width measurement mode, pulse period measurement mode
	Timer RB	8 bits $\times$ 1 (with 8-bit prescaler) Timer mode (period timer), programmable waveform generation mode (PWM output), programmable one-shot generation mode, programmable wait one-shot generation mode
	Timer RC	16 bits $\times$ 1 (with 4 capture/compare registers) Timer mode (input capture function, output compare function), PWM mode (output 3 pins), PWM2 mode (PWM output pin)

**Table 1.2 Specifications for R8C/33T Group (2)**

Item	Function	Specification
Serial Interface	UART0, UART1	Clock synchronous serial I/O/UART × 2 channel
	UART2	Clock synchronous serial I/O/UART, I <sup>2</sup> C mode (I <sup>2</sup> C-bus), SSU mode, multiprocessor communication function
LIN Module		Hardware LIN: 1 (timer RA, UART0)
A/D Converter		10-bit resolution × 12 channels, includes sample and hold function, with sweep mode
Sensor Control Unit		System CH × 3, electrostatic capacitive touch detection × 18
Flash Memory		<ul style="list-style-type: none"> <li>• Programming and erasure voltage: VCC = 2.7 V to 5.5 V</li> <li>• Programming and erasure endurance: 10,000 times (data flash) 1,000 times (program ROM)</li> <li>• Program security: ROM code protect, ID code check</li> <li>• Debug functions: On-chip debug, on-board flash rewrite function</li> <li>• Background operation (BGO) function</li> </ul>
Operating Frequency/Supply Voltage		f(XIN) = 20 MHz (VCC = 2.7 V to 5.5 V) f(XIN) = 5 MHz (VCC = 1.8 V to 5.5 V)
Current Consumption		Typ. 6.5 mA (VCC = 5.0 V, f(XIN) = 20 MHz) Typ. 3.5 mA (VCC = 3.0 V, f(XIN) = 10 MHz) Typ. 3.5 μA (VCC = 3.0 V, wait mode) Typ. 2.0 μA (VCC = 3.0 V, stop mode)
Operating Ambient Temperature		−20 to 85°C (N version) −40 to 85°C (D version) <sup>(1)</sup>
Package		32-pin LQFP Package code: PLQP0032GB-A (previous code: 32P6U-A)

Note:

1. Specify the D version if D version functions are to be used.

## 1.2 Product List

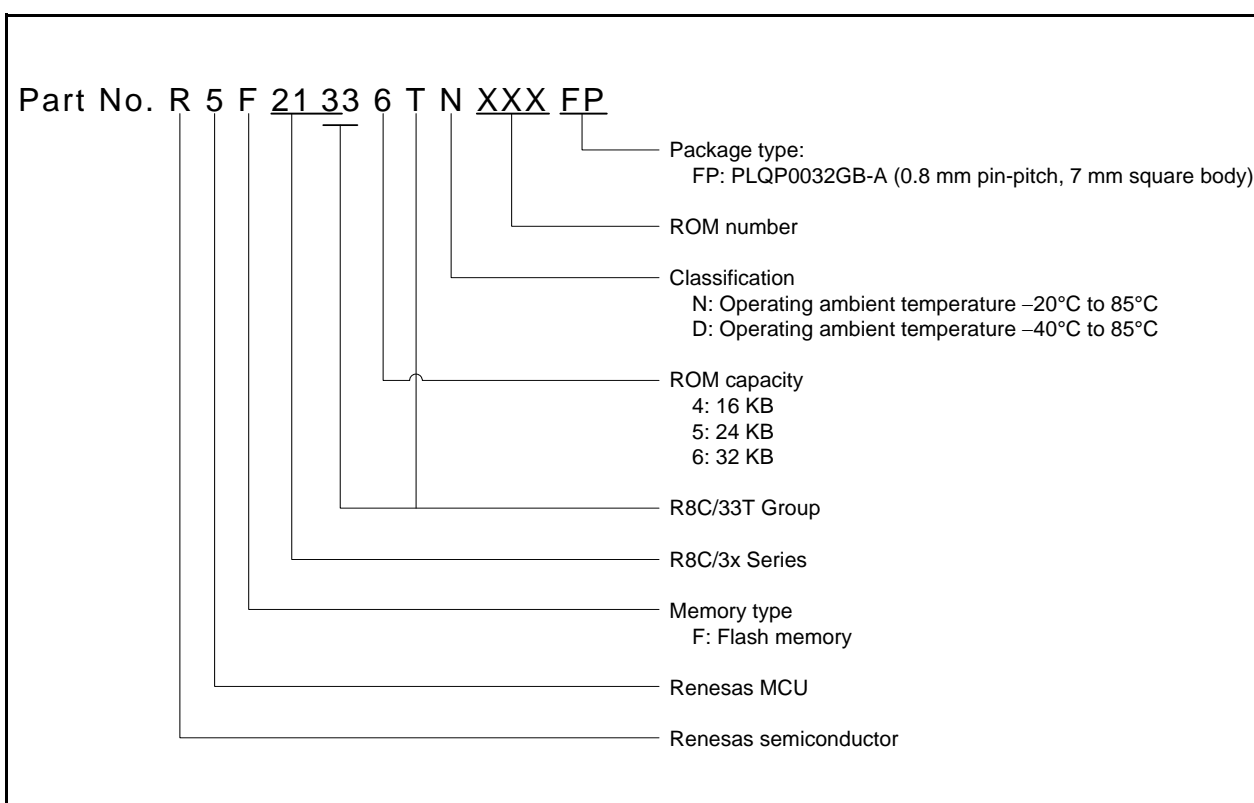

Table 1.3 lists Product List for R8C/33T Group. Figure 1.1 shows a Part Number, Memory Size, and Package of R8C/33T Group.

**Table 1.3 Product List for R8C/33T Group**

**Current of Mar. 2010**

Part No.	ROM Capacity		RAM Capacity	Package Type	Remarks
	Program ROM	Data flash			
R5F21334TNFP	16 Kbytes	1 Kbyte × 4	1.5 Kbytes	PLQP0032GB-A	N version
R5F21335TNFP	24 Kbytes	1 Kbyte × 4	2 Kbytes	PLQP0032GB-A	
R5F21336TNFP	32 Kbytes	1 Kbyte × 4	2.5 Kbytes	PLQP0032GB-A	
R5F21334TDFP	16 Kbytes	1 Kbyte × 4	1.5 Kbytes	PLQP0032GB-A	D version
R5F21335TDFP	24 Kbytes	1 Kbyte × 4	2 Kbytes	PLQP0032GB-A	
R5F21336TDFP	32 Kbytes	1 Kbyte × 4	2.5 Kbytes	PLQP0032GB-A	
R5F21334TNXXXFP (D)	16 Kbytes	1 Kbyte × 4	1.5 Kbytes	PLQP0032GB-A	N version
R5F21335TNXXXFP (D)	24 Kbytes	1 Kbyte × 4	2 Kbytes	PLQP0032GB-A	Factory-programming product
R5F21336TNXXXFP (D)	32 Kbytes	1 Kbyte × 4	2.5 Kbytes	PLQP0032GB-A	
R5F21334TDXXXFP (D)	16 Kbytes	1 Kbyte × 4	1.5 Kbytes	PLQP0032GB-A	D version
R5F21335TDXXXFP (D)	24 Kbytes	1 Kbyte × 4	2 Kbytes	PLQP0032GB-A	Factory-programming product
R5F21336TDXXXFP (D)	32 Kbytes	1 Kbyte × 4	2.5 Kbytes	PLQP0032GB-A	

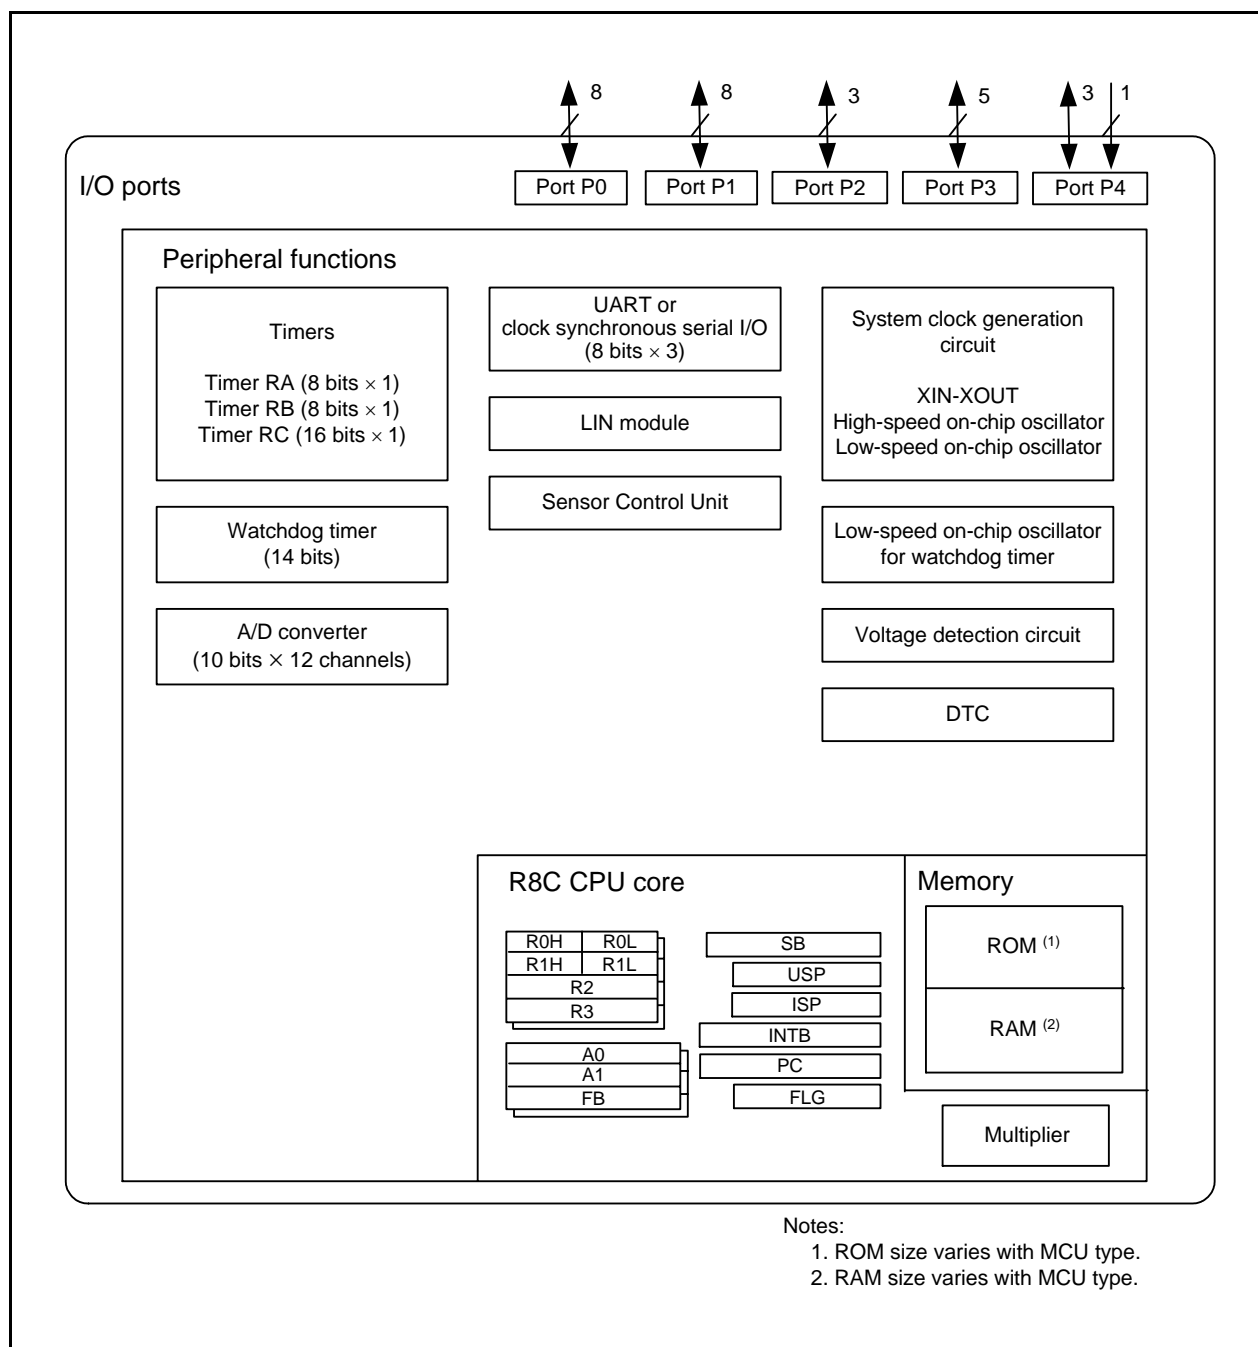

(D): Under development

### 1.3 Block Diagram

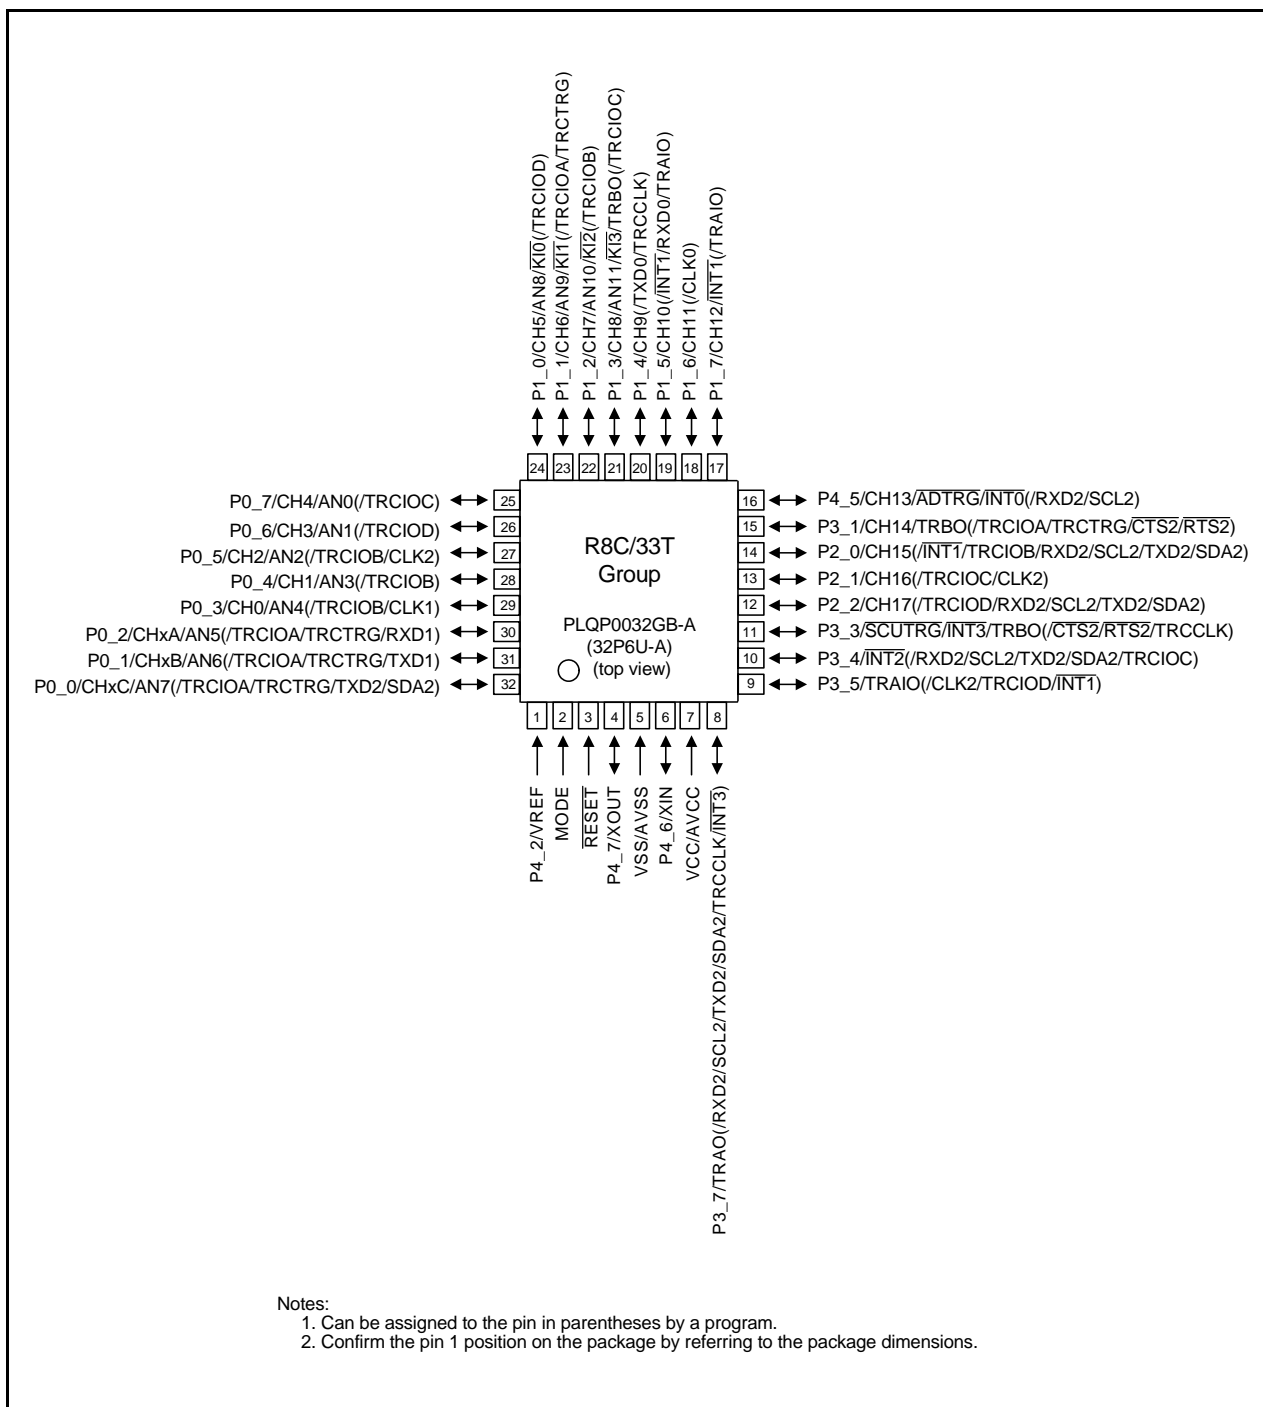

Figure 1.2 shows a Block Diagram.

**Figure 1.2 Block Diagram**

## 1.4 Pin Assignment

Figure 1.3 shows Pin Assignment (Top View). Table 1.4 outlines the Pin Name Information by Pin Number.

**Figure 1.3 Pin Assignment (Top View)**

**Table 1.4 Pin Name Information by Pin Number**

Pin Number	Control Pin	Port	I/O Pin Functions for Peripheral Modules				
			Interrupt	Timer	Serial Interface	A/D Converter	Sensor Control Unit
1		P4_2				VREF	
2	MODE						
3	RESET						
4	XOUT	P4_7					
5	VSS/AVSS						
6	XIN	P4_6					
7	VCC/AVCC						
8		P3_7	(INT3)	TRAO/ (TRCCLK)	(RXD2/SCL2/ TXD2/SDA2)		
9		P3_5	(INT1)	TRAIO/ (TRCIOD)	(CLK2)		
10		P3_4	INT2	(TRCIOA)	(RXD2/SCL2/ TXD2/SDA2)		
11		P3_3	INT3	TRBO/ (TRCCLK)	(CTS2/RTS2)		SCUTRG
12		P2_2		(TRCIOD)	(RXD2/TXD2/ SCL2/SDA2)		CH17
13		P2_1		(TRCIOA)	(CLK2)		CH16
14		P2_0	(INT1)	(TRCIOB)	(RXD2/TXD2/ SCL2/SDA2)		CH15
15		P3_1		TRBO/ (TRCTRG/ TRCIOA)	(CTS2/RTS2)		CH14
16		P4_5	INT0		(RXD2/SCL2)	ADTRG	CH13
17		P1_7	INT1	(TRAIO)			CH12
18		P1_6			(CLK0)		CH11
19		P1_5	(INT1)	(TRAIO)	(RXD0)		CH10
20		P1_4		(TRCCLK)	(TXD0)		CH9
21		P1_3	KI3	TRBO (/TRCIOA)		AN11	CH8
22		P1_2	KI2	(TRCIOB)		AN10	CH7
23		P1_1	KI1	(TRCIOA/ TRCTRG)		AN9	CH6
24		P1_0	KI0	(TRCIOD)		AN8	CH5
25		P0_7		(TRCIOA)		AN0	CH4
26		P0_6		(TRCIOD)		AN1	CH3
27		P0_5		(TRCIOB)	(CLK2)	AN2	CH2
28		P0_4		(TRCIOB)		AN3	CH1
29		P0_3		(TRCIOB)	(CLK1)	AN4	CH0
30		P0_2		(TRCIOA/ TRCTRG)	(RXD1)	AN5	CHxA
31		P0_1		(TRCIOA/ TRCTRG)	(TXD1)	AN6	CHxB
32		P0_0		(TRCIOA/ TRCTRG)	(TXD2/SDA2)	AN7	CHxC

Note:

1. Can be assigned to the pin in parentheses by a program.

## 1.5 Pin Functions

Table 1.5 lists Pin Functions.

**Table 1.5 Pin Functions**

Item	Pin Name	I/O Type	Description
Power supply input	VCC, VSS	—	Apply 1.8 V to 5.5 V to the VCC pin. Apply 0 V to the VSS pin.
Analog power supply input	AVCC, AVSS	—	Power supply for the A/D converter. Connect a capacitor between AVCC and AVSS.
Reset input	$\overline{\text{RESET}}$	I	Input "L" on this pin resets the MCU.
MODE	MODE	I	Connect this pin to VCC via a resistor.
XIN clock input	XIN	I	These pins are provided for XIN clock generation circuit I/O. Connect a ceramic resonator or a crystal oscillator between the XIN and XOUT pins. <sup>(1)</sup> To use an external clock, input it to the XOUT pin and leave the XIN pin open.
XIN clock output	XOUT	I/O	
$\overline{\text{INT}}$ interrupt input	$\overline{\text{INT0}}$ to $\overline{\text{INT3}}$	I	$\overline{\text{INT}}$ interrupt input pins. $\overline{\text{INT0}}$ is timer RB, and RC input pin.
Key input interrupt	$\overline{\text{KI0}}$ to $\overline{\text{KI3}}$	I	Key input interrupt input pins
Timer RA	TRAIO	I/O	Timer RA I/O pin
	TRA0	O	Timer RA output pin
Timer RB	TRBO	O	Timer RB output pin
Timer RC	TRCLK	I	External clock input pin
	TRCTR $\overline{\text{G}}$	I	External trigger input pin
	TRCIOA, TRCIOB, TRCIO $\overline{\text{C}}$ , TRCIOD	I/O	Timer RC I/O pins
Serial interface	CLK0, CLK1, CLK2	I/O	Transfer clock I/O pins
	RXD0, RXD1, RXD2	I	Serial data input pins
	TXD0, TXD1, TXD2	O	Serial data output pins
	$\overline{\text{CTS2}}$	I	Transmission control input pin
	$\overline{\text{RTS2}}$	O	Reception control output pin
	SCL2	I/O	I <sup>2</sup> C mode clock I/O pin
	SDA2	I/O	I <sup>2</sup> C mode data I/O pin
Reference voltage input	VREF	I	Reference voltage input pin to A/D converter
A/D converter	AN0 to AN11	I	Analog input pins to A/D converter
	ADTR $\overline{\text{G}}$	I	AD external trigger input pin
Sensor control unit	CHxA, CHxB, CHxC	I/O	Control pins for electrostatic capacitive touch detection
	CH0 to CH17	I	Electrostatic capacitive touch detection pins
	SCUTR $\overline{\text{G}}$	I	Sensor control unit external trigger input
I/O port	P0_0 to P0_7, P1_0 to P1_7, P2_0 to P2_2, P3_1, P3_3 to P3_5, P3_7, P4_5 to P4_7	I/O	CMOS I/O ports. Each port has an I/O select direction register, allowing each pin in the port to be directed for input or output individually. Any port set to input can be set to use a pull-up resistor or not by a program. All ports can be used as LED drive ports.
Input port	P4_2	I	Input-only port

I: Input      O: Output      I/O: Input and output

Note:

1. Refer to the oscillator manufacturer for oscillation characteristics.

## 2. Central Processing Unit (CPU)

Figure 2.1 shows the CPU Registers. The CPU contains 13 registers. R0, R1, R2, R3, A0, A1, and FB configure a register bank. There are two sets of register bank.

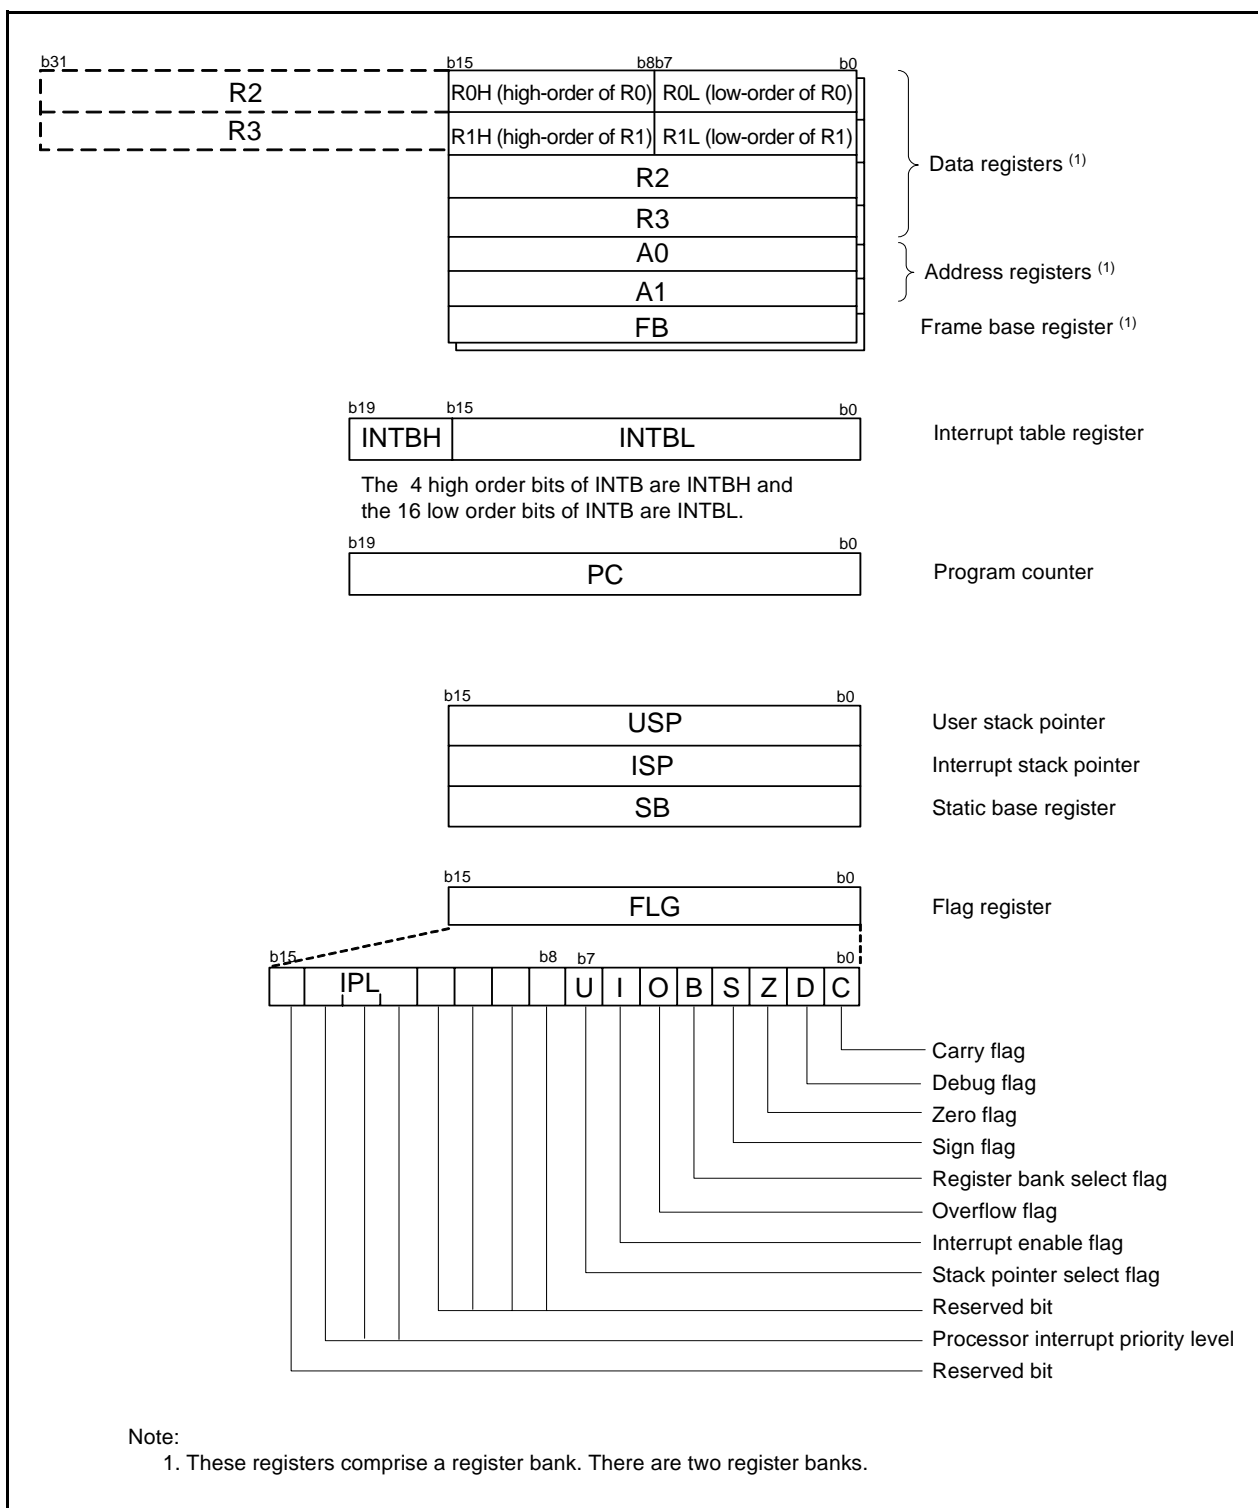

Figure 2.1 CPU Registers

## 2.1 Data Registers (R0, R1, R2, and R3)

R0 is a 16-bit register for transfer, arithmetic, and logic operations. The same applies to R1 to R3. R0 can be split into high-order bits (R0H) and low-order bits (R0L) to be used separately as 8-bit data registers. R1H and R1L are analogous to R0H and R0L. R2 can be combined with R0 and used as a 32-bit data register (R2R0). R3R1 is analogous to R2R0.

## 2.2 Address Registers (A0 and A1)

A0 is a 16-bit register for address register indirect addressing and address register relative addressing. It is also used for transfer, arithmetic, and logic operations. A1 is analogous to A0. A1 can be combined with A0 and as a 32-bit address register (A1A0).

## 2.3 Frame Base Register (FB)

FB is a 16-bit register for FB relative addressing.

## 2.4 Interrupt Table Register (INTB)

INTB is a 20-bit register that indicates the starting address of an interrupt vector table.

## 2.5 Program Counter (PC)

PC is 20 bits wide and indicates the address of the next instruction to be executed.

## 2.6 User Stack Pointer (USP) and Interrupt Stack Pointer (ISP)

The stack pointers (SP), USP and ISP, are each 16 bits wide. The U flag of FLG is used to switch between USP and ISP.

## 2.7 Static Base Register (SB)

SB is a 16-bit register for SB relative addressing.

## 2.8 Flag Register (FLG)

FLG is an 11-bit register indicating the CPU state.

### 2.8.1 Carry Flag (C)

The C flag retains carry, borrow, or shift-out bits that have been generated by the arithmetic and logic unit.

### 2.8.2 Debug Flag (D)

The D flag is for debugging only. Set it to 0.

### 2.8.3 Zero Flag (Z)

The Z flag is set to 1 when an arithmetic operation results in 0; otherwise to 0.

### 2.8.4 Sign Flag (S)

The S flag is set to 1 when an arithmetic operation results in a negative value; otherwise to 0.

### 2.8.5 Register Bank Select Flag (B)

Register bank 0 is selected when the B flag is 0. Register bank 1 is selected when this flag is set to 1.

### 2.8.6 Overflow Flag (O)

The O flag is set to 1 when an operation results in an overflow; otherwise to 0.

### **2.8.7 Interrupt Enable Flag (I)**

The I flag enables maskable interrupts.

Interrupts are disabled when the I flag is set to 0, and are enabled when the I flag is set to 1. The I flag is set to 0 when an interrupt request is acknowledged.

### **2.8.8 Stack Pointer Select Flag (U)**

ISP is selected when the U flag is set to 0; USP is selected when the U flag is set to 1.

The U flag is set to 0 when a hardware interrupt request is acknowledged or the INT instruction of software interrupt numbers 0 to 31 is executed.

### **2.8.9 Processor Interrupt Priority Level (IPL)**

IPL is 3 bits wide and assigns processor interrupt priority levels from level 0 to level 7.

If a requested interrupt has higher priority than IPL, the interrupt is enabled.

### **2.8.10 Reserved Bit**

If necessary, set to 0. When read, the content is undefined.

### 3. Memory

#### 3.1 R8C/33T Group

Figure 3.1 is a Memory Map of R8C/33T Group. The R8C/33T Group has a 1-Mbyte address space from addresses 00000h to FFFFFh. The internal ROM (program ROM) is allocated lower addresses, beginning with address 0FFFFh. For example, a 32-Kbyte internal ROM area is allocated addresses 08000h to 0FFFFh.

The fixed interrupt vector table is allocated addresses 0FFDCh to 0FFFFh. The starting address of each interrupt routine is stored here.

The internal ROM (data flash) is allocated addresses 03000h to 03FFFh.

The internal RAM is allocated higher addresses, beginning with address 00400h. For example, a 2.5-Kbyte internal RAM area is allocated addresses 00400h to 00DFFh. The internal RAM is used not only for data storage but also as a stack area when a subroutine is called or when an interrupt request is acknowledged.

Special function registers (SFRs) are allocated addresses 00000h to 002FFh and 02C00h to 02FFFh. Peripheral function control registers are allocated here. All unallocated spaces within the SFRs are reserved and cannot be accessed by users.

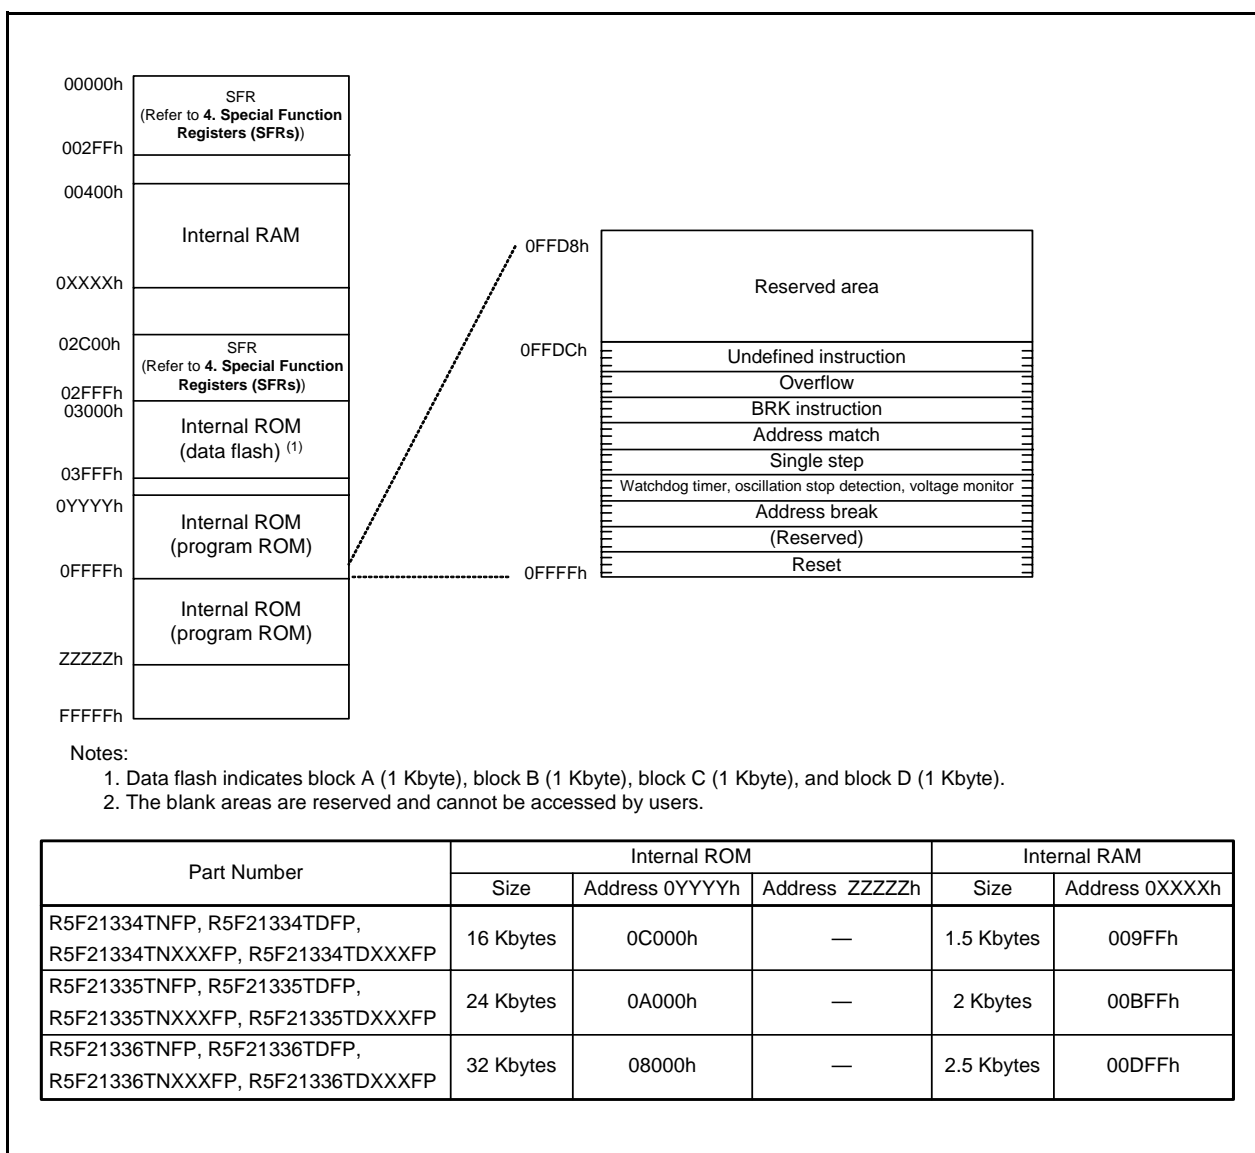

Figure 3.1 Memory Map of R8C/33T Group

## 4. Special Function Registers (SFRs)

An SFR (special function register) is a control register for a peripheral function. Tables 4.1 to 4.12 list the special function registers. Table 4.13 lists the ID Code Areas and Option Function Select Area.

**Table 4.1 SFR Information (1) (1)**

Address	Register	Symbol	After Reset

X: Undefined

Notes:

1. The blank areas are reserved and cannot be accessed by users.
2. The CWR bit in the RSTFR register is set to 0 after power-on and voltage monitor 0 reset. Hardware reset, Software reset, or watchdog timer reset does not affect this bit.
3. The CSPROINI bit in the OFS register is set to 0.
4. The LVDAS bit in the OFS register is set to 1.
5. The LVDAS bit in the OFS register is set to 0.

FFFFh	Option Function Select Register	OFS	(Note 1)

**Notes:**

1. The option function select area is allocated in the flash memory, not in the SFRs. Set appropriate values as ROM data by a program.  
Do not write additions to the option function select area. If the block including the option function select area is erased, the option function select area is set to FFh.  
When blank products are shipped, the option function select area is set to FFh. It is set to the written value after written by the user.  
When factory-programming products are shipped, the value of the option function select area is the value programmed by the user.
2. The ID code areas are allocated in the flash memory, not in the SFRs. Set appropriate values as ROM data by a program.  
Do not write additions to the ID code areas. If the block including the ID code areas is erased, the ID code areas are set to FFh.  
When blank products are shipped, the ID code areas are set to FFh. They are set to the written value after written by the user.  
When factory-programming products are shipped, the value of the ID code areas is the value programmed by the user.

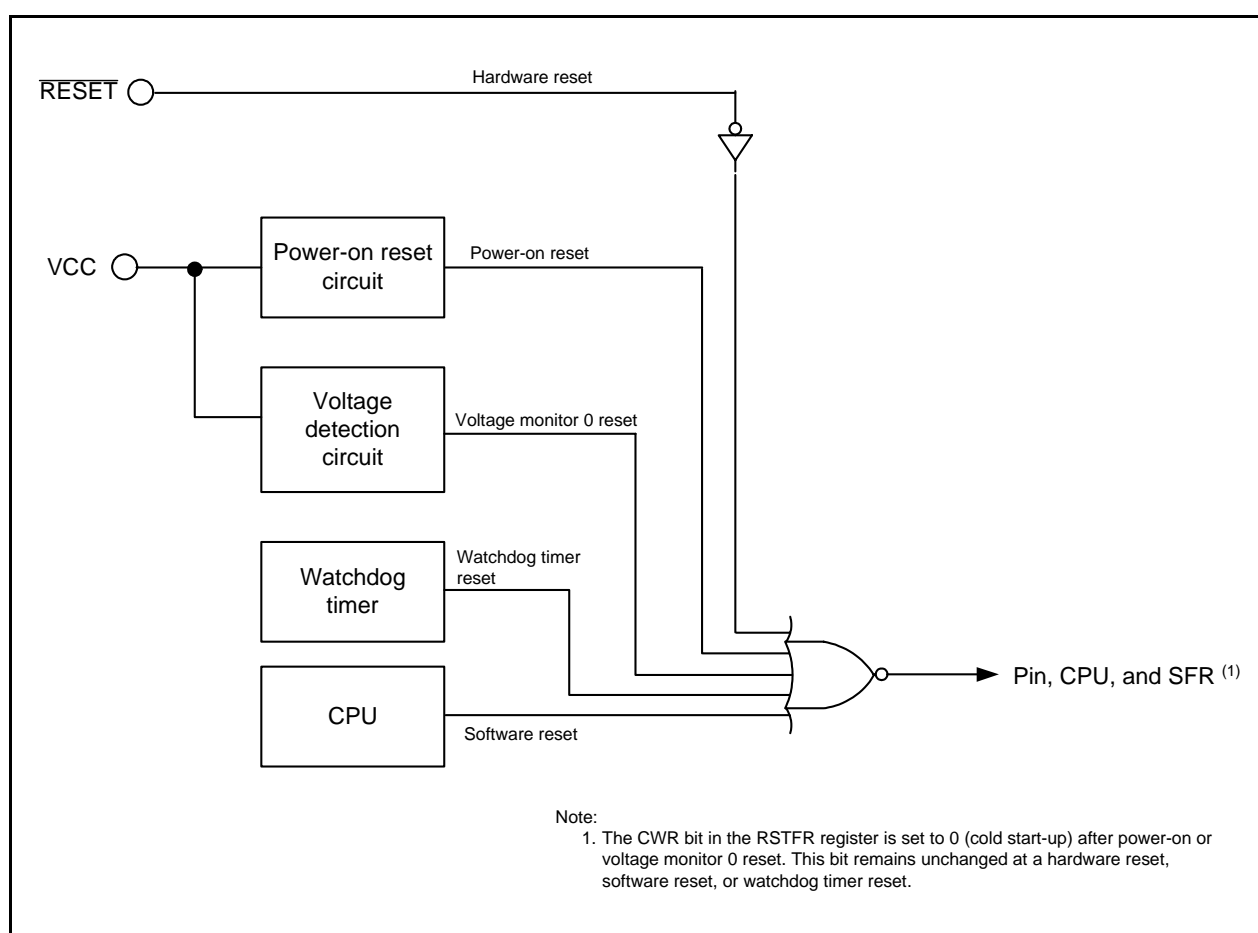

## 5. Resets

The following resets are implemented: hardware reset, power-on reset, voltage monitor 0 reset, watchdog timer reset, and software reset.

Table 5.1 lists the Reset Names and Sources and Figure 5.1 shows the Block Diagram of Reset Circuit.

**Table 5.1 Reset Names and Sources**

Reset Name	Source
Hardware reset	Input voltage of $\overline{\text{RESET}}$ pin is held "L"
Power-on reset	VCC rises
Voltage monitor 0 reset	VCC falls (monitor voltage: Vdet0)
Watchdog timer reset	Underflow of watchdog timer
Software reset	Write 1 to PM03 bit in PM0 register

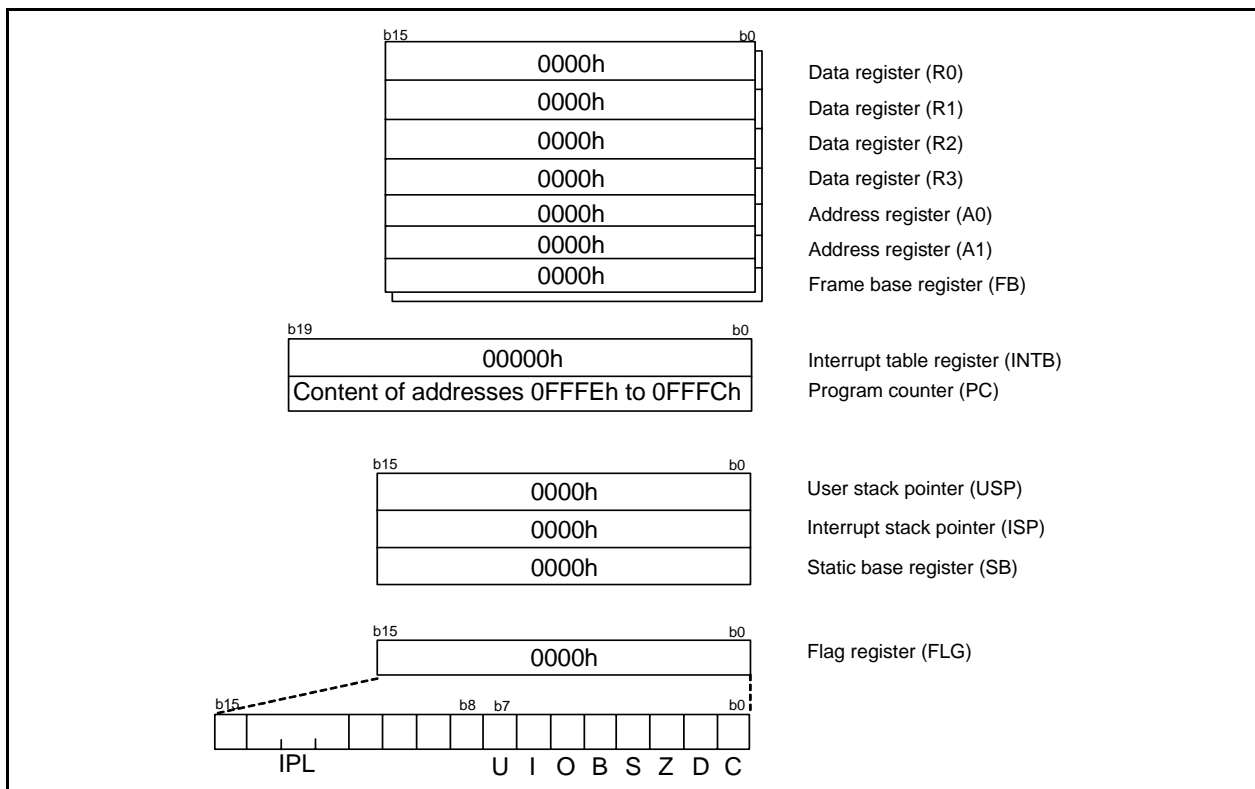

**Figure 5.1 Block Diagram of Reset Circuit**

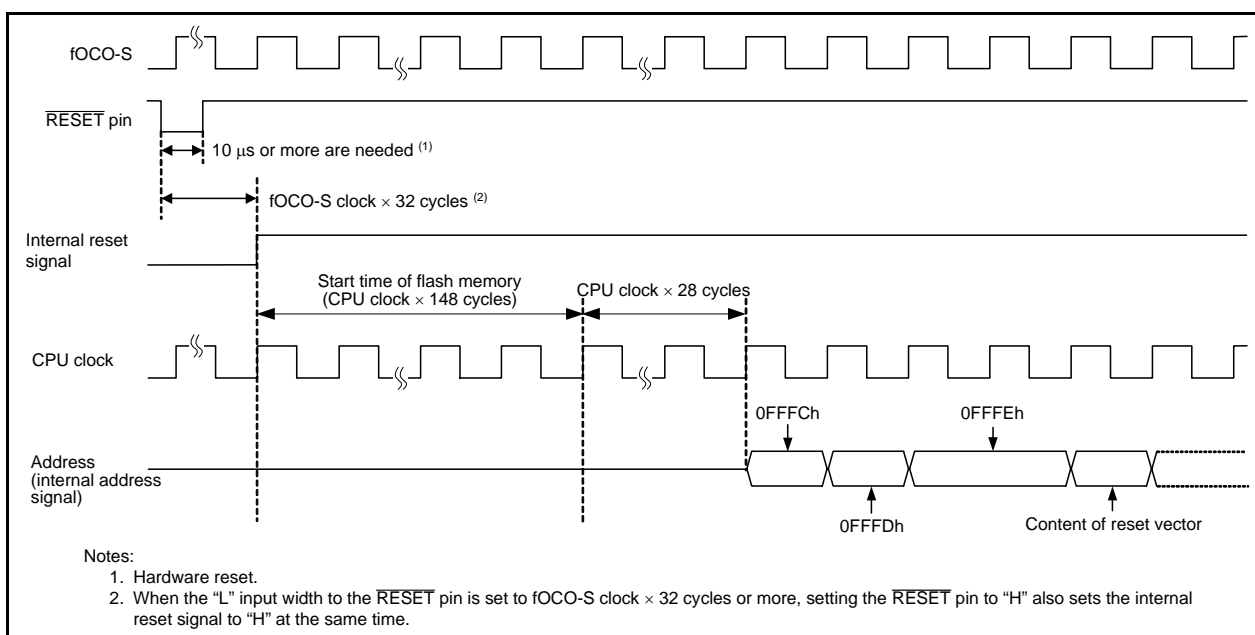

Table 5.2 lists the Pin Functions while  $\overline{\text{RESET}}$  Pin Level is “L”, Figure 5.2 shows the CPU Register Status after Reset, Figure 5.3 shows the Reset Sequence.

**Table 5.2 Pin Functions while  $\overline{\text{RESET}}$  Pin Level is “L”**

Pin Name	Pin Function
P0, P1, P2_0 to P2_2, P3_1, P3_3 to P3_5, P3_7	Input port
P4_2, P4_5 to P4_7	Input port

**Figure 5.2 CPU Register Status after Reset**

**Figure 5.3 Reset Sequence**

## 5.1 Registers

### 5.1.1 Processor Mode Register 0 (PM0)

Address 0004h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	PM03	—	—	—
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	—	Reserved bits	Set to 0.	R/W
b1	—			
b2	—			
b3	PM03	Software reset bit	The MCU is reset when this bit is set to 1. When read, the content is 0.	R/W
b4	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b5	—			
b6	—			
b7	—			

Set the PRC1 bit in the PRCR register to 1 (write enabled) before rewriting the PM0 register.

### 5.1.2 Reset Source Determination Register (RSTFR)

Address 000Bh

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	WDR	SWR	HWR	CWR
After Reset	0	X	X	X	X	X	X	X

(Note 1)

Bit	Symbol	Bit Name	Function	R/W
b0	CWR	Cold start-up/warm start-up determine flag <sup>(2, 3)</sup>	0: Cold start-up 1: Warm start-up	R/W
b1	HWR	Hardware reset detect flag	0: Not detected 1: Detected	R
b2	SWR	Software reset detect flag	0: Not detected 1: Detected	R
b3	WDR	Watchdog timer reset detect flag	0: Not detected 1: Detected	R
b4	—	Reserved bits	When read, the content is undefined.	R
b5	—			
b6	—			
b7	—	Reserved bit	Set to 0.	R/W

Notes:

1. The CWR bit is set to 0 (cold start-up) after power-on or voltage monitor 0 reset. This bit remains unchanged at a hardware reset, software reset, or watchdog timer reset.
2. If 1 is written to the CWR bit by a program, it is set to 1. (Writing 0 does not affect this bit.)
3. When the VW0C0 bit in the VW0C register is set to 0 (voltage monitor 0 reset disabled), the CWR bit value is undefined.

### 5.1.3 Option Function Select Register (OFS)

Address 0FFFFh

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	CSPROINI	LVDAS	VDSEL1	VDSEL0	ROMCP1	ROMCR	—	WDTON
After Reset	User Setting Value <sup>(1)</sup>							

Bit	Symbol	Bit Name	Function	R/W
b0	WDTON	Watchdog timer start select bit	0: Watchdog timer automatically starts after reset. 1: Watchdog timer is stopped after reset.	R/W
b1	—	Reserved bit	Set to 1.	R/W
b2	ROMCR	ROM code protect disable bit	0: ROM code protect disabled 1: ROMCP1 bit enabled	R/W
b3	ROMCP1	ROM code protect bit	0: ROM code protect enabled 1: ROM code protect disabled	R/W
b4	VDSEL0	Voltage detection 0 level select bit <sup>(2)</sup>	b5 b4 0 0: 3.80 V selected (Vdet0_3) 0 1: 2.85 V selected (Vdet0_2) 1 0: 2.35 V selected (Vdet0_1) 1 1: 1.90 V selected (Vdet0_0)	R/W
b5	VDSEL1			R/W
b6	LVDAS	Voltage detection 0 circuit start bit <sup>(3)</sup>	0: Voltage monitor 0 reset enabled after reset 1: Voltage monitor 0 reset disabled after reset	R/W
b7	CSPROINI	Count source protection mode after reset select bit	0: Count source protect mode enabled after reset 1: Count source protect mode disabled after reset	R/W

Notes:

1. The OFS register is allocated in the flash memory, not in the SFRs. Set appropriate values as ROM data by a program.  
Do not write additions to the OFS register. If the block including the OFS register is erased, the OFS register is set to FFh.  
When blank products are shipped, the OFS register is set to FFh. It is set to the written value after written by the user.  
When factory-programming products are shipped, the value of the OFS register is the value programmed by the user.
2. The same level of the voltage detection 0 level selected by bits VDSEL0 and VDESL1 is set in both functions of voltage monitor 0 reset and power-on reset.
3. To use power-on reset and voltage monitor 0 reset, set the LVDAS bit to 0 (voltage monitor 0 reset enabled after reset).

For a setting example of the OFS register, refer to **13.3.1 Setting Example of Option Function Select Area**.

#### LVDAS Bit (Voltage Detection 0 Circuit Start Bit)

The Vdet0 voltage to be monitored by the voltage detection 0 circuit is selected by bits VDSEL0 and VDSEL1.

### 5.1.4 Option Function Select Register 2 (OFS2)

Address 0FFDBh

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	WDTRCS1	WDTRCS0	WDTUFS1	WDTUFS0
After Reset	User Setting Value <sup>(1)</sup>							

Bit	Symbol	Bit Name	Function	R/W
b0	WDTUFS0	Watchdog timer underflow period set bit	b1 b0 0 0: 03FFh 0 1: 0FFFh 1 0: 1FFFh 1 1: 3FFFh	R/W
b1	WDTUFS1			R/W
b2	WDTRCS0	Watchdog timer refresh acknowledgement period set bit	b3 b2 0 0: 25% 0 1: 50% 1 0: 75% 1 1: 100%	R/W
b3	WDTRCS1			R/W
b4	—	Reserved bits	Set to 1.	R/W
b5	—			
b6	—			
b7	—			

Note:

- The OFS2 register is allocated in the flash memory, not in the SFRs. Set appropriate values as ROM data by a program.  
Do not write additions to the OFS2 register. If the block including the OFS2 register is erased, the OFS2 register is set to FFh.  
When blank products are shipped, the OFS2 register is set to FFh. It is set to the written value after written by the user.  
When factory-programming products are shipped, the value of the OFS2 register is the value programmed by the user.

For a setting example of the OFS2 register, refer to **13.3.1 Setting Example of Option Function Select Area**.

#### Bits WDTRCS0 and WDTRCS1 (Watchdog Timer Refresh Acknowledgement Period Set Bit)

Assuming that the period from when the watchdog timer starts counting until it underflows is 100%, the refresh acknowledgement period for the watchdog timer can be selected.

For details, refer to **14.3.1.1 Refresh Acknowledgment Period**.

## 5.2 Hardware Reset

A reset is applied using the  $\overline{\text{RESET}}$  pin. When an “L” signal is applied to the  $\overline{\text{RESET}}$  pin while the supply voltage meets the recommended operating conditions, pins, CPU, and SFRs are all reset (refer to **Table 5.2 Pin Functions while  $\overline{\text{RESET}}$  Pin Level is “L”**, **Figure 5.2 CPU Register Status after Reset**, and **Table 4.1 to 4.12 SFR Information**). When the input level applied to the  $\overline{\text{RESET}}$  pin changes from “L” to “H”, a program is executed beginning with the address indicated by the reset vector. After reset, the low-speed on-chip oscillator clock with no division is automatically selected as the CPU clock.

Refer to **4. Special Function Registers (SFRs)** for the states of the SFRs after reset.

The internal RAM is not reset. If the  $\overline{\text{RESET}}$  pin is pulled “L” while writing to the internal RAM is in progress, the contents of internal RAM will be undefined.

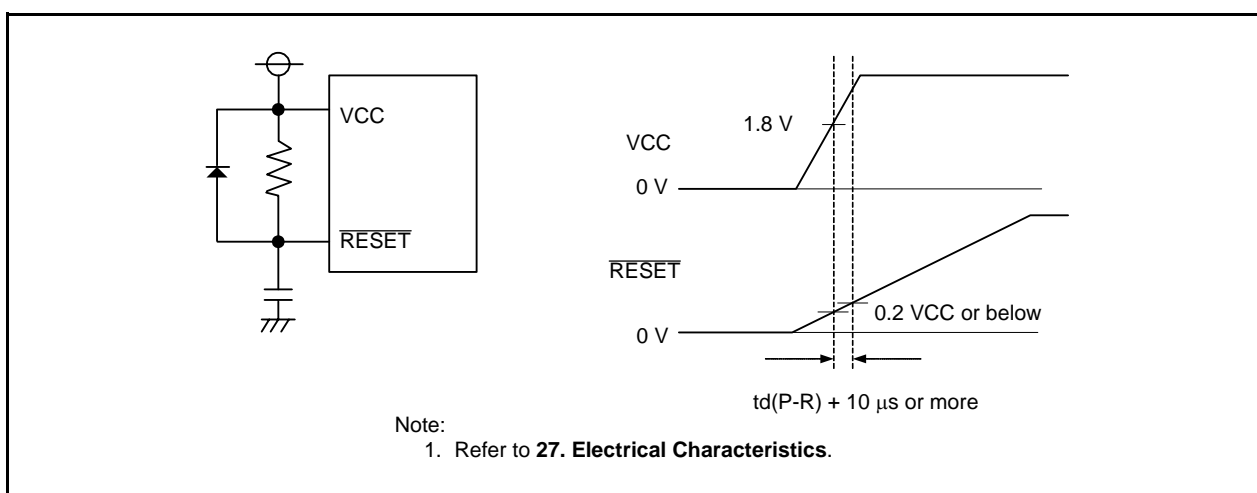

Figure 5.4 shows an Example of Hardware Reset Circuit and Operation and Figure 5.5 shows an Example of Hardware Reset Circuit (Usage Example of External Supply Voltage Detection Circuit) and Operation.

### 5.2.1 When Power Supply is Stable

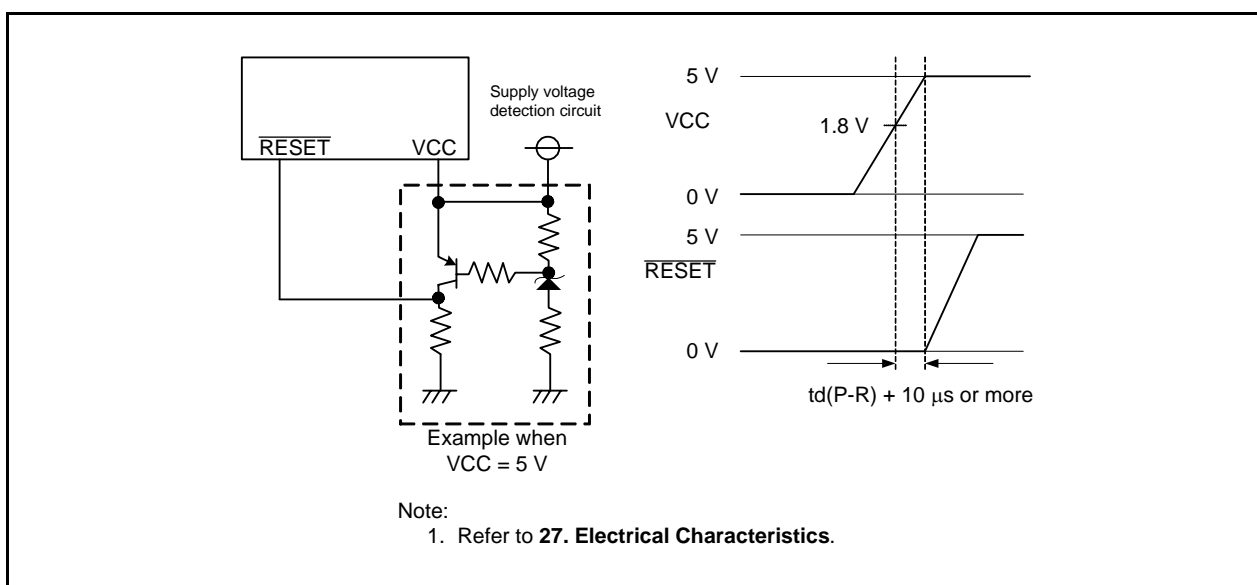

- (1) Apply “L” to the  $\overline{\text{RESET}}$  pin.
- (2) Wait for 10  $\mu\text{s}$ .
- (3) Apply “H” to the  $\overline{\text{RESET}}$  pin.

### 5.2.2 Power On

- (1) Apply “L” to the  $\overline{\text{RESET}}$  pin.
- (2) Let the supply voltage increase until it meets the recommended operating conditions.
- (3) Wait for  $t_d(\text{P-R})$  or more to allow the internal power supply to stabilize (refer to **27. Electrical Characteristics**).
- (4) Wait for 10  $\mu\text{s}$ .
- (5) Apply “H” to the  $\overline{\text{RESET}}$  pin.

**Figure 5.4 Example of Hardware Reset Circuit and Operation**

**Figure 5.5 Example of Hardware Reset Circuit (Usage Example of External Supply Voltage Detection Circuit) and Operation**

### 5.3 Power-On Reset Function

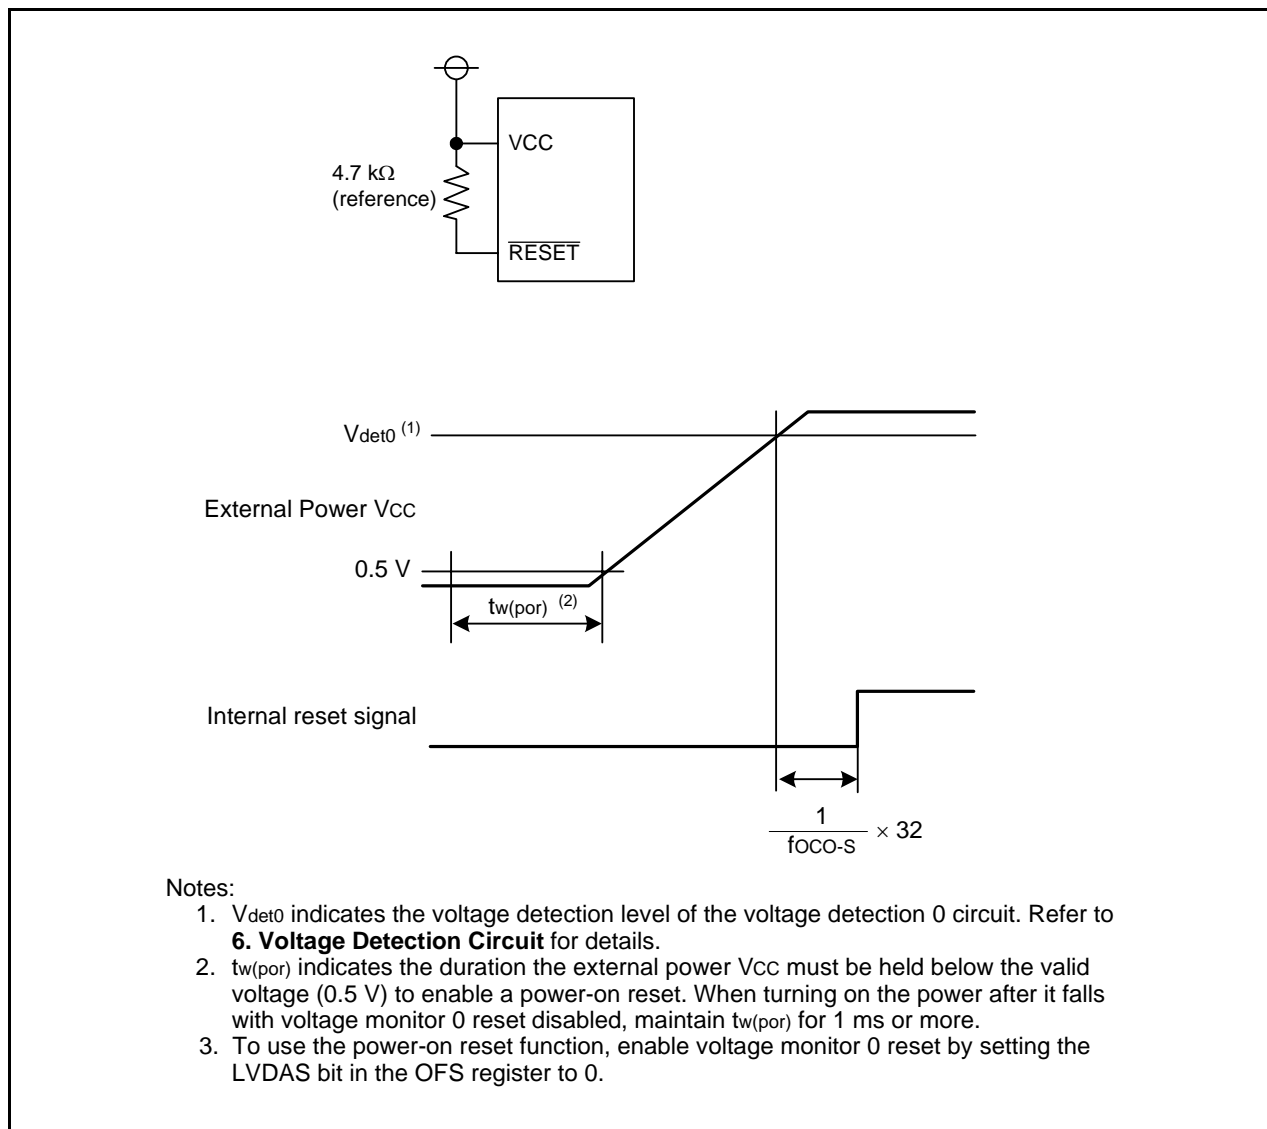

When the  $\overline{\text{RESET}}$  pin is connected to the VCC pin via a pull-up resistor, and the VCC pin voltage level rises, the power-on reset function is enabled and the MCU resets its pins, CPU, and SFR. When a capacitor is connected to the  $\overline{\text{RESET}}$  pin, too, always keep the voltage to the  $\overline{\text{RESET}}$  pin  $0.8V_{CC}$  or more.

When the input voltage to the VCC pin reaches the  $V_{det0}$  level or above, the low-speed on-chip oscillator clock starts counting. When the low-speed on-chip oscillator clock count reaches 32, the internal reset signal is held “H” and the MCU enters the reset sequence (refer to Figure 5.3). The low-speed on-chip oscillator clock with no division is automatically selected as the CPU clock after reset.

Refer to **4. Special Function Registers (SFRs)** for the states of the SFR after power-on reset.

To use the power-on reset function, enable voltage monitor 0 reset by setting the LVDAS bit in the OFS register to 0.

Figure 5.6 shows an Example of Power-On Reset Circuit and Operation.

**Figure 5.6 Example of Power-On Reset Circuit and Operation**

## 5.4 Voltage Monitor 0 Reset

A reset is applied using the on-chip voltage detection 0 circuit. The voltage detection 0 circuit monitors the input voltage to the VCC pin. The voltage to monitor is Vdet0. To use voltage monitor 0 reset, set the LVDAS bit in the OFS register to 0 (voltage monitor 0 reset enabled after reset). The Vdet0 voltage detection level can be changed by the settings of bits VDSEL0 to VDSEL1 in the OFS register.

When the input voltage to the VCC pin reaches the Vdet0 level or below, the pins, CPU, and SFR are reset.

When the input voltage to the VCC pin reaches the Vdet0 level or above, the low-speed on-chip oscillator clock start counting. When the low-speed on-chip oscillator clock count reaches 32, the internal reset signal is held “H” and the MCU enters the reset sequence (refer to Figure 5.3). The low-speed on-chip oscillator clock with no division is automatically selected as the CPU clock after reset.

To use the power-on reset function, enable voltage monitor 0 reset by setting the LVDAS bit in the OFS register to 0.

Bits VDSEL0 to VDSEL1 and LVDAS cannot be changed by a program. To set these bits, write values to b4 to b6 of address 0FFFFh using a flash programmer.

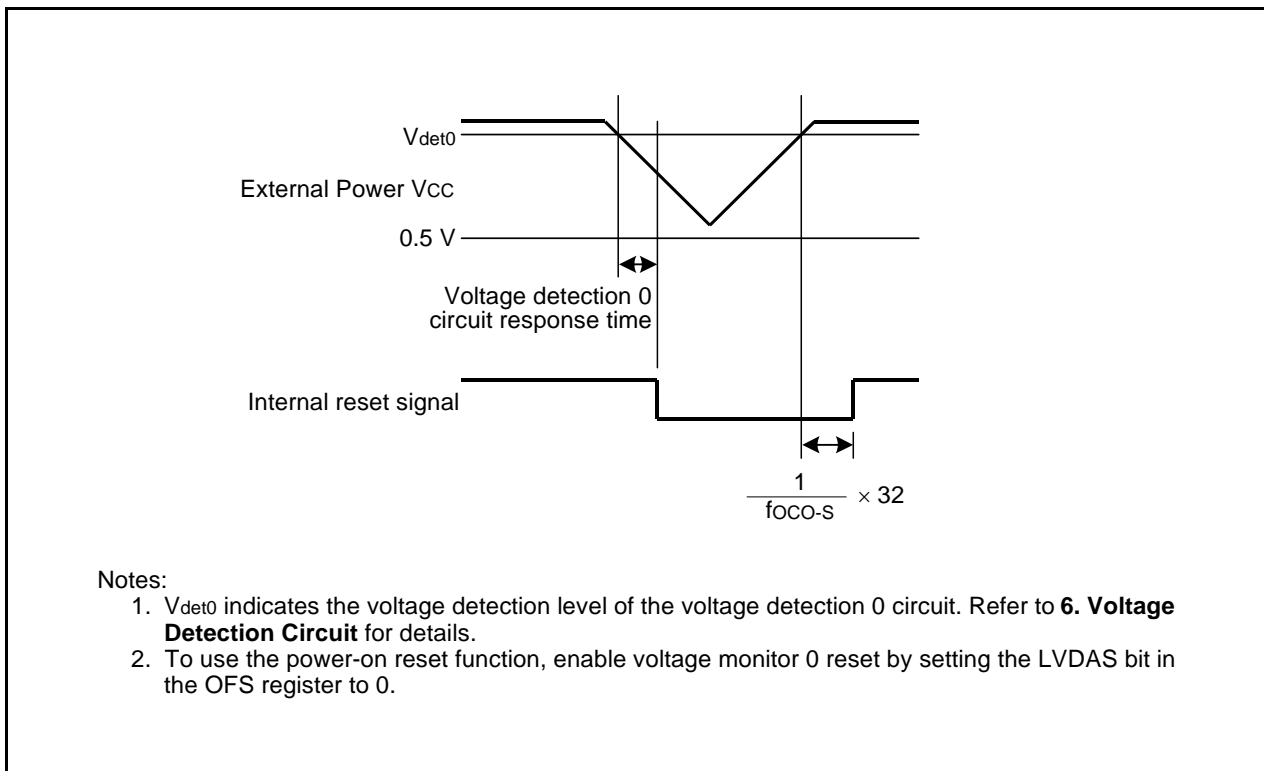

Refer to **5.1.3 Option Function Select Register (OFS)** for details of the OFS register.

Refer to **4. Special Function Registers (SFRs)** for the status of the SFR after voltage monitor 0 reset.

The internal RAM is not reset. When the input voltage to the VCC pin reaches the Vdet0 level or below while writing to the internal RAM is in progress, the contents of internal RAM are undefined.

Refer to **6. Voltage Detection Circuit** for details of voltage monitor 0 reset.

Figure 5.7 shows an Example of Voltage Monitor 0 Reset Circuit and Operation.

**Figure 5.7** Example of Voltage Monitor 0 Reset Circuit and Operation

### 5.5 Watchdog Timer Reset

When the PM12 bit in the PM1 register is set to 1 (reset when watchdog timer underflows), the MCU resets its pins, CPU, and SFR if the watchdog timer underflows. Then the program beginning with the address indicated by the reset vector is executed. After reset, the low-speed on-chip oscillator clock with no division is automatically selected as the CPU clock.

Refer to **4. Special Function Registers (SFRs)** for the states of the SFRs after watchdog timer reset.

The internal RAM is not reset. When the watchdog timer underflows, while writing to the internal RAM is in progress, the contents of internal RAM are undefined.

The underflow period and refresh acknowledge period for the watchdog timer can be set by bits WDTUFS0 to WDTUFS1 and bits WDTRCS0 to WDTRCS1 in the OFS2 register, respectively.

Refer to **14. Watchdog Timer** for details of the watchdog timer.

### 5.6 Software Reset

When the PM03 bit in the PM0 register is set to 1 (MCU reset), the MCU resets its pins, CPU, and SFR. The program beginning with the address indicated by the reset vector is executed. After reset, the low-speed on-chip oscillator clock with no division is automatically selected for the CPU clock.

Refer to **4. Special Function Registers (SFRs)** for the states of the SFRs after software reset.

The internal RAM is not reset.

### 5.7 Cold Start-Up/Warm Start-Up Determination Function

The cold start-up/warm start-up determination function uses the CWR bit in the RSTFR register to determine cold start-up (reset process) at power-on and warm start-up (reset process) when a reset occurred during operation.

The CWR bit is set to 0 (cold start-up) at power-on and also set to 0 at a voltage monitor 0 reset. If 1 is written to the CWR bit by a program, it is set to 1. This bit remains unchanged at a hardware reset, software reset, or watchdog timer reset.

The cold start-up/warm start-up determination function uses voltage monitor 0 reset.

Figure 5.8 shows an Operating Example of Cold Start-Up/Warm Start-Up Function

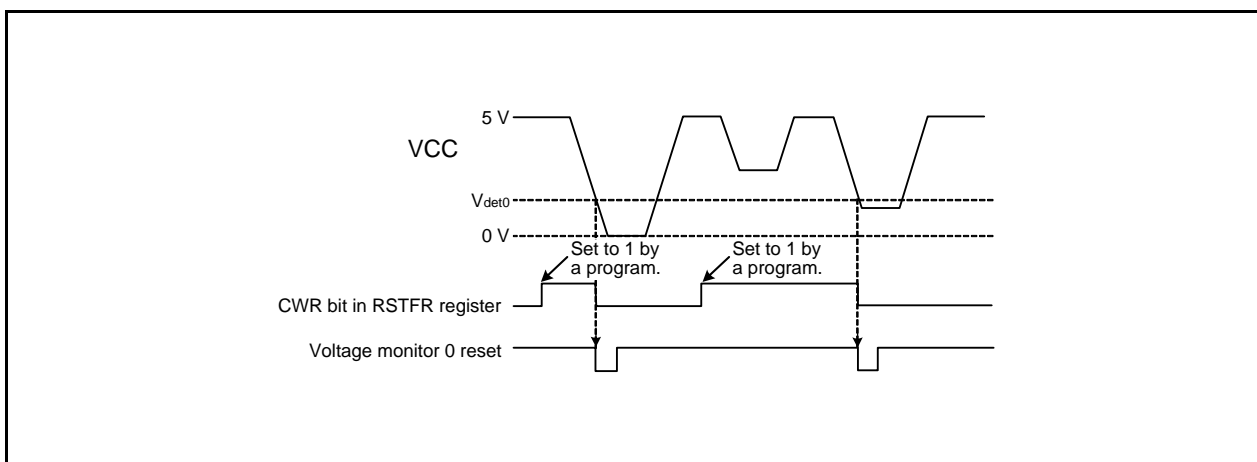

Figure 5.8 Operating Example of Cold Start-Up/Warm Start-Up Function

### 5.8 Reset Source Determination Function

The RSTFR register can be used to detect whether a hardware reset, software reset, or watchdog timer reset has occurred.

If a hardware reset occurs, the HWR bit is set to 1 (detected). If a software reset occurs, the SWR bit is set to 1 (detected). If a watchdog timer reset occurs, the WDR bit is set to 1 (detected).

## 6. Voltage Detection Circuit

The voltage detection circuit monitors the voltage input to the VCC pin. This circuit can be used to monitor the VCC input voltage by a program.

### 6.1 Overview

The detection voltage of voltage detection 0 can be selected among four levels using the OFS register.

The detection voltage of voltage detection 1 can be selected among 16 levels using the VD1LS register.

The voltage monitor 0 reset, and voltage monitor 1 interrupt and voltage monitor 2 interrupt can also be used.

**Table 6.1 Voltage Detection Circuit Specifications**

Item		Voltage Monitor 0	Voltage Monitor 1	Voltage Monitor 2
VCC monitor	Voltage to monitor	Vdet0	Vdet1	Vdet2
	Detection target	Whether passing through Vdet0 by falling	Whether passing through Vdet1 by rising or falling	Whether passing through Vdet2 by rising or falling
	Detection voltage	Selectable among 4 levels using the OFS register.	Selectable among 16 levels using the VD1LS register.	Fixed level
	Monitor	None	The VW1C3 bit in the VW1C register Whether VCC is higher or lower than Vdet1	The VCA13 bit in the VCA1 register Whether VCC is higher or lower than Vdet2
Process at voltage detection	Reset	Voltage monitor 0 reset	None	None
		Reset at Vdet0 > VCC; CPU operation restarts at VCC > Vdet0		
	Interrupts	None	Voltage monitor 1 interrupt Non-maskable or maskable selectable Interrupt request at: Vdet1 > VCC and/or VCC > Vdet1	Voltage monitor 2 interrupt Non-maskable or maskable selectable Interrupt request at: Vdet2 > VCC and/or VCC > Vdet2
Digital filter	Switching enable/disable	No digital filter function	Supported	Supported
	Sampling time	—	(fOCO-S divided by n) × 2 n: 1, 2, 4, and 8	(fOCO-S divided by n) × 2 n: 1, 2, 4, and 8

**Figure 6.4** Block Diagram of Voltage Monitor 2 Interrupt Generation Circuit

## 6.2 Registers

### 6.2.1 Voltage Monitor Circuit Control Register (CMPA)

Address 0030h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	COMPSEL	—	IRQ2SEL	IRQ1SEL	—	—	—	—
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	—	Reserved bits	Set to 0.	R/W
b1	—			
b2	—			
b3	—			
b4	IRQ1SEL	Voltage monitor 1 interrupt type select bit (1)	0: Non-maskable interrupt 1: Maskable interrupt	R/W
b5	IRQ2SEL	Voltage monitor 2 interrupt type select bit (2)	0: Non-maskable interrupt 1: Maskable interrupt	R/W
b6	—	Reserved bit	Set to 0.	R/W
b7	COMPSEL	Voltage monitor interrupt type selection enable bit (1, 2)	0: Bits IRQ1SEL and IRQ2SEL disabled 1: Bits IRQ1SEL and IRQ2SEL enabled	R/W

Notes:

1. When the VW1C0 bit in the VW1C register is set to 1 (enabled), do not set bits IRQ1SEL and COMPSEL simultaneously (with one instruction).
2. When the VW2C0 bit in the VW2C register is set to 1 (enabled), do not set bits IRQ2SEL and COMPSEL simultaneously (with one instruction).

### 6.2.2 Voltage Monitor Circuit Edge Select Register (VCAC)

Address 0031h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	—	VCAC2	VCAC1	—
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b1	VCAC1	Voltage monitor 1 circuit edge select bit <sup>(1)</sup>	0: One edge 1: Both edges	R/W
b2	VCAC2	Voltage monitor 2 circuit edge select bit <sup>(2)</sup>	0: One edge 1: Both edges	R/W
b3	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b4	—			
b5	—			
b6	—			
b7	—			

Notes:

1. When the VCAC1 bit is set to 0 (one edge), the VW1C7 bit in the VW1C register is enabled. Set the VW1C7 bit after setting the VCAC1 bit to 0.
2. When the VCAC2 bit is set to 0 (one edge), the VW2C7 bit in the VW2C register is enabled. Set the VW2C7 bit after setting the VCAC2 bit to 0.

### 6.2.3 Voltage Detect Register 1 (VCA1)

Address 0033h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	VCA13	—	—	—
After Reset	0	0	0	0	1	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	—	Reserved bits	Set to 0.	R/W
b1	—			
b2	—			
b3	VCA13	Voltage detection 2 signal monitor flag <sup>(1)</sup>	0: $VCC < V_{det2}$ 1: $VCC \geq V_{det2}$ or voltage detection 2 circuit disabled	R
b4	—	Reserved bits	Set to 0.	R/W
b5	—			
b6	—			
b7	—			

Note:

1. When the VCA27 bit in the VCA2 register is set to 1 (voltage detection 2 circuit enabled), the VCA13 bit is enabled.  
When the VCA27 bit in the VCA2 register is set to 0 (voltage detection 2 circuit disabled), the VCA13 bit is set to 1 ( $VCC \geq V_{det2}$ ).

### 6.2.4 Voltage Detect Register 2 (VCA2)

Address 0034h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	VCA27	VCA26	VCA25	—	—	—	—	VCA20
After Reset	0	0	0	0	0	0	0	0

The above applies when the LVDAS bit in the OFS register is set to 1.

After Reset	0	0	1	0	0	0	0	0
-------------	---	---	---	---	---	---	---	---

The above applies when the LVDAS bit in the OFS register is set to 0.

Bit	Symbol	Bit Name	Function	R/W
b0	VCA20	Internal power low consumption enable bit <sup>(1)</sup>	0: Low consumption disabled 1: Low consumption enabled <sup>(2)</sup>	R/W
b1	—	Reserved bits	Set to 0.	R/W
b2	—			
b3	—			
b4	—			
b5	VCA25	Voltage detection 0 enable bit <sup>(3)</sup>	0: Voltage detection 0 circuit disabled 1: Voltage detection 0 circuit enabled	R/W
b6	VCA26	Voltage detection 1 enable bit <sup>(4)</sup>	0: Voltage detection 1 circuit disabled 1: Voltage detection 1 circuit enabled	R/W
b7	VCA27	Voltage detection 2 enable bit <sup>(5)</sup>	0: Voltage detection 2 circuit disabled 1: Voltage detection 2 circuit enabled	R/W

Notes:

1. Use the VCA20 bit only when the MCU enters wait mode. To set the VCA20 bit, follow the procedure shown in **Figure 9.3 Procedure for Reducing Internal Power Consumption Using VCA20 bit.**
2. When the VCA20 bit is set to 1 (low consumption enabled), do not set the CM10 bit in the CM1 register to 1 (stop mode).
3. When writing to the VCA25 bit, set a value after reset.
4. To use the voltage detection 1 interrupt or the VW1C3 bit in the VW1C register, set the VCA26 bit to 1. After the VCA26 bit is set to 1 from 0, allow  $t_d(E-A)$  to elapse before the voltage detection 1 circuit starts operation.
5. To use the voltage detection 2 interrupt or the VCA13 bit in the VCA1 register, set the VCA27 bit to 1. After the VCA27 bit is set to 1 from 0, allow  $t_d(E-A)$  to elapse before the voltage detection 2 circuit starts operation.

Set the PRC3 bit in the PRCR register to 1 (write enabled) before rewriting the VCA2 register.

### 6.2.5 Voltage Detection 1 Level Select Register (VD1LS)

Address 0036h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	VD1S3	VD1S2	VD1S1	VD1S0
After Reset	0	0	0	0	0	1	1	1

Bit	Symbol	Bit Name	Function	R/W
b0	VD1S0	Voltage detection 1 level select bit (Reference voltage when the voltage falls)	b3 b2 b1 b0 0 0 0 0: 2.20 V (Vdet1_0)	R/W
b1	VD1S1		0 0 0 1: 2.35 V (Vdet1_1)	R/W
b2	VD1S2		0 0 1 0: 2.50 V (Vdet1_2)	R/W
b3	VD1S3		0 0 1 1: 2.65 V (Vdet1_3)	R/W
			0 1 0 0: 2.80 V (Vdet1_4)	
			0 1 0 1: 2.95 V (Vdet1_5)	
			0 1 1 0: 3.10 V (Vdet1_6)	
			0 1 1 1: 3.25 V (Vdet1_7)	
			1 0 0 0: 3.40 V (Vdet1_8)	
			1 0 0 1: 3.55 V (Vdet1_9)	
			1 0 1 0: 3.70 V (Vdet1_A)	
			1 0 1 1: 3.85 V (Vdet1_B)	
			1 1 0 0: 4.00 V (Vdet1_C)	
			1 1 0 1: 4.15 V (Vdet1_D)	
			1 1 1 0: 4.30 V (Vdet1_E)	
			1 1 1 1: 4.45 V (Vdet1_F)	
b4	—	Reserved bits	Set to 0.	R/W
b5	—			
b6	—			
b7	—			

Set the PRC3 bit in the PRCR register to 1 (write enabled) before rewriting the VD1LS register.

### 6.2.6 Voltage Monitor 0 Circuit Control Register (VW0C)

Address 0038h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	—	—	—	VW0C0
After Reset	1	1	0	0	X	0	1	0

The above applies when the LVDAS bit in the OFS register is set to 1.

After Reset	1	1	0	0	X	0	1	1
-------------	---	---	---	---	---	---	---	---

The above applies when the LVDAS bit in the OFS register is set to 0.

Bit	Symbol	Bit Name	Function	R/W
b0	VW0C0	Voltage monitor 0 reset enable bit <sup>(1)</sup>	0: Disabled 1: Enabled	R/W
b1	—	Reserved bit	Set to 1.	R/W
b2	—	Reserved bit	Set to 0.	R/W
b3	—	Reserved bit	When read, the content is undefined.	R
b4	—	Reserved bits	Set to 0.	R/W
b5	—			
b6	—	Reserved bits	Set to 1.	R/W
b7	—			

Note:

1. The VW0C0 bit is enabled when the VCA25 bit in the VCA2 register is set to 1 (voltage detection 0 circuit enabled). When writing to the VW0C0 bit, set a value after reset.

Set the PRC3 bit in the PRCR register to 1 (write enabled) before writing the VW0C register.

### 6.2.7 Voltage Monitor 1 Circuit Control Register (VW1C)

Address 0039h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	VW1C7	—	VW1F1	VW1F0	VW1C3	VW1C2	VW1C1	VW1C0
After Reset	1	0	0	0	1	0	1	0

Bit	Symbol	Bit Name	Function	R/W
b0	VW1C0	Voltage monitor 1 interrupt enable bit <sup>(1)</sup>	0: Disabled 1: Enabled	R/W
b1	VW1C1	Voltage monitor 1 digital filter disable mode select bit <sup>(2, 6)</sup>	0: Digital filter enabled mode (digital filter circuit enabled) 1: Digital filter disable mode (digital filter circuit disabled)	R/W
b2	VW1C2	Voltage change detection flag <sup>(3, 4)</sup>	0: Not detected 1: Vdet1 passing detected	R/W
b3	VW1C3	Voltage detection 1 signal monitor flag <sup>(3)</sup>	0: VCC < Vdet1 1: VCC ≥ Vdet1 or voltage detection 1 circuit disabled	R
b4	VW1F0	Sampling clock select bit <sup>(6)</sup>	b5 b4 0 0: fOCO-S divided by 1 0 1: fOCO-S divided by 2 1 0: fOCO-S divided by 4 1 1: fOCO-S divided by 8	R/W
b5	VW1F1			R/W
b6	—	Reserved bit	Set to 0.	R/W
b7	VW1C7	Voltage monitor 1 interrupt generation condition select bit <sup>(5)</sup>	0: When VCC reaches Vdet1 or above. 1: When VCC reaches Vdet1 or below.	R/W

## Notes:

1. The VW1C0 is enabled when the VCA26 bit in the VCA2 register is set to 1 (voltage detection 1 circuit enabled). Set the VW1C0 bit to 0 (disabled) when the VCA26 bit is set to 0 (voltage detection 1 circuit disabled). To set the VW0C0 bit to 1 (enabled), follow the procedure shown in **Table 6.2 Procedure for Setting Bits Associated with Voltage Monitor 1 Interrupt**.
2. When using the digital filter (while the VW1C1 bit is 0), set the CM14 bit in the CM1 register to 0 (low-speed on-chip oscillator on). To use the voltage monitor 1 interrupt to exit stop mode, set the VW1C1 bit in the VW1C register to 1 (digital filter disabled).
3. Bits VW1C2 and VW1C3 are enabled when the VCA26 bit in the VCA2 register is set to 1 (voltage detection 1 circuit enabled).
4. Set the VW1C2 bit to 0 by a program. When 0 is written by a program, this bit is set to 0 (and remains unchanged even if 1 is written to it).
5. The VW1C7 bit is enabled when the VCAC1 bit in the VCAC register is set to 0 (one edge). After setting the VCAC1 bit to 0, set the VW1C7 bit.
6. When the VW1C0 bit is set to 1 (enabled), do not set the VW1C1 bit and bits VW1F1 and VW1F0 simultaneously (with one instruction).

Set the PRC3 bit in the PRCR register to 1 (write enabled) before writing the VW1C register.

Rewriting the VW1C register may set the VW1C2 bit to 1. Set the VW1C2 bit to 0 after rewriting the VW1C register.

### 6.2.8 Voltage Monitor 2 Circuit Control Register (VW2C)

Address 003Ah

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	VW2C7	—	VW2F1	VW2F0	VW2C3	VW2C2	VW2C1	VW2C0
After Reset	1	0	0	0	0	0	1	0

Bit	Symbol	Bit Name	Function	R/W
b0	VW2C0	Voltage monitor 2 interrupt enable bit <sup>(1)</sup>	0: Disabled 1: Enabled	R/W
b1	VW2C1	Voltage monitor 2 digital filter disable mode select bit <sup>(2, 6)</sup>	0: Digital filter enable mode (digital filter circuit enabled) 1: Digital filter disable mode (digital filter circuit disabled)	R/W
b2	VW2C2	Voltage change detection flag <sup>(3, 4)</sup>	0: Not detected 1: Vdet2 passing detected	R/W
b3	VW2C3	WDT detection monitor flag <sup>(4)</sup>	0: Not detected 1: Detected	R/W
b4	VW2F0	Sampling clock select bit <sup>(6)</sup>	b5 b4 0 0: fOCO-S divided by 1 0 1: fOCO-S divided by 2 1 0: fOCO-S divided by 4 1 1: fOCO-S divided by 8	R/W
b5	VW2F1			R/W
b6	—	Reserved bit	Set to 0.	R/W
b7	VW2C7	Voltage monitor 2 interrupt generation condition select bit <sup>(5)</sup>	0: When VCC reaches Vdet2 or above. 1: When VCC reaches Vdet2 or below.	R/W

Notes:

1. The VW2C0 is enabled when the VCA27 bit in the VCA2 register is set to 1 (voltage detection 2 circuit enabled). Set the VW2C0 bit to 0 (disabled) when the VCA27 bit is set to 0 (voltage detection 2 circuit disabled). To set the VW2C0 bit to 1 (enabled), follow the procedure shown in **Table 6.3 Procedure for Setting Bits Associated with Voltage Monitor 2 Interrupt**.
2. When using the digital filter (while the VW2C1 bit is 0), set the CM14 bit in the CM1 register to 0 (low-speed on-chip oscillator on). To use the voltage monitor 2 interrupt to exit stop mode, set the VW2C1 bit in the VW2C register to 1 (digital filter disabled).
3. The VW2C2 bit is enabled when the VCA27 bit in the VCA2 register is set to 1 (voltage detection 2 circuit enabled).
4. Set this bit to 0 by a program. When 0 is written by a program, this bit is set to 0 (and remains unchanged even if 1 is written to it).
5. The VW2C7 bit is enabled when the VCAC2 bit in the VCAC register is set to 0 (one edge). After setting the VCAC2 bit to 0, set the VW2C7 bit.
6. When the VW2C0 bit is set to 1 (enabled), do not set the VW2C1 bit and bits VW2F1 and VW2F0 simultaneously (with one instruction).

Set the PRC3 bit in the PRCR register to 1 (write enabled) before rewriting the VW2C register.

Rewriting the VW2C register may set the VW2C2 bit to 1. After rewriting this register, set the VW2C2 bit to 0.

### 6.2.9 Option Function Select Register (OFS)

Address 0FFFFh

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	CSPROINI	LVDAS	VDSEL1	VDSEL0	ROMCP1	ROMCR	—	WDTON
After Reset	User Setting Value <sup>(1)</sup>							

Bit	Symbol	Bit Name	Function	R/W
b0	WDTON	Watchdog timer start select bit	0: Watchdog timer automatically starts after reset. 1: Watchdog timer is stopped after reset.	R/W
b1	—	Reserved bit	Set to 1.	R/W
b2	ROMCR	ROM code protect disable bit	0: ROM code protect disabled 1: ROMCP1 bit enabled	R/W
b3	ROMCP1	ROM code protect bit	0: ROM code protect enabled 1: ROM code protect disabled	R/W
b4	VDSEL0	Voltage detection 0 level select bit <sup>(2)</sup>	b5 b4 0 0: 3.80 V selected (Vdet0_3) 0 1: 2.85 V selected (Vdet0_2) 1 0: 2.35 V selected (Vdet0_1) 1 1: 1.90 V selected (Vdet0_0)	R/W
b5	VDSEL1			R/W
b6	LVDAS	Voltage detection 0 circuit start bit <sup>(3)</sup>	0: Voltage monitor 0 reset enabled after reset 1: Voltage monitor 0 reset disabled after reset	R/W
b7	CSPROINI	Count source protection mode after reset select bit	0: Count source protect mode enabled after reset 1: Count source protect mode disabled after reset	R/W

Notes:

- The OFS register is allocated in the flash memory, not in the SFRs. Set appropriate values as ROM data by a program.  
Do not write additions to the OFS register. If the block including the OFS register is erased, the OFS register is set to FFh.  
When blank products are shipped, the OFS register is set to FFh. It is set to the written value after written by the user.  
When factory-programming products are shipped, the value of the OFS register is the value programmed by the user.
- The same level of the voltage detection 0 level selected by bits VDSEL0 and VDSEL1 is set in both functions of voltage monitor 0 reset and power-on reset.
- To use power-on reset and voltage monitor 0 reset, set the LVDAS bit to 0 (voltage monitor 0 reset enabled after reset).

For a setting example of the OFS register, refer to **13.3.1 Setting Example of Option Function Select Area**.

#### LVDAS Bit (Voltage Detection 0 Circuit Start Bit)

The Vdet0 voltage to be monitored by the voltage detection 0 circuit is selected by bits VDSEL0 and VDSEL1.

## 6.3 VCC Input Voltage

### 6.3.1 Monitoring Vdet0

Vdet0 cannot be monitored.

### 6.3.2 Monitoring Vdet1

Once the following settings are made, the comparison result of voltage monitor 1 can be monitored by the VW1C3 bit in the VW1C register after td(E-A) has elapsed (refer to **27. Electrical Characteristics**).

- (1) Set bits VD1S3 to VD1S0 in the VD1LS register (voltage detection 1 detection voltage).
- (2) Set the VCA26 bit in the VCA2 register to 1 (voltage detection 1 circuit enabled).

### 6.3.3 Monitoring Vdet2

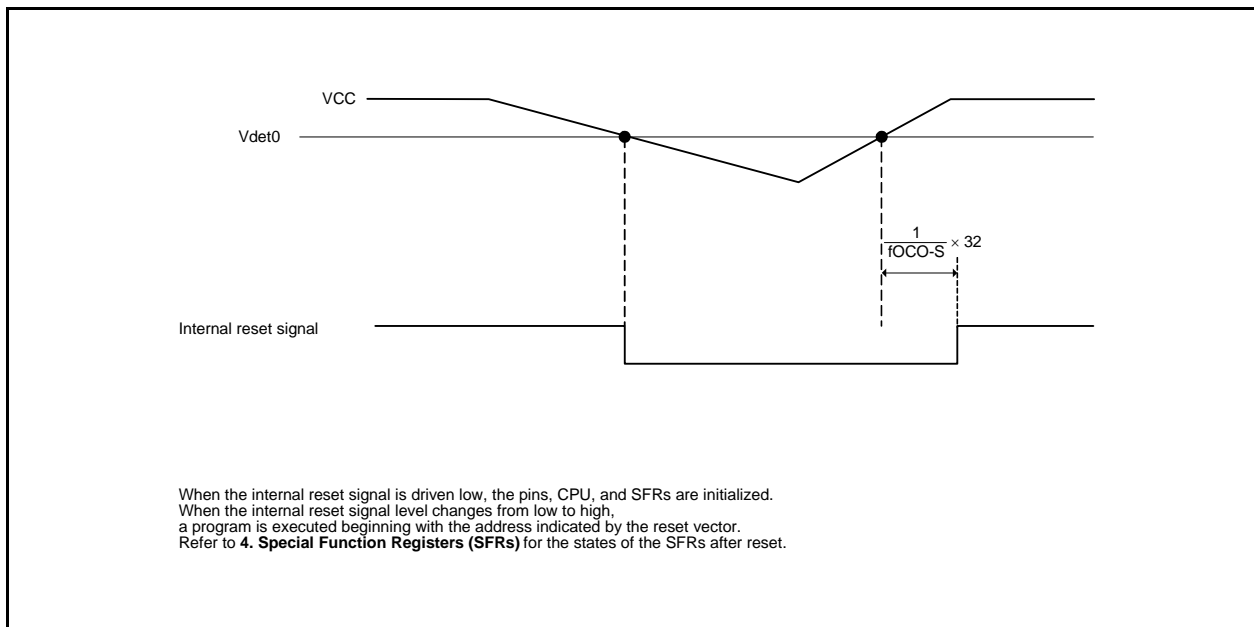

Once the following settings are made, the comparison result of voltage monitor 2 can be monitored by the VCA13 bit in the VCA1 register after td(E-A) has elapsed (refer to **27. Electrical Characteristics**).

- Set the VCA27 bit in the VCA2 register to 1 (voltage detection 2 circuit enabled).

## 6.4 Voltage Monitor 0 Reset

To use voltage monitor 0 reset, set the LVDAS bit in the OFS register to 0 (voltage monitor 0 reset enabled after reset).

Figure 6.5 shows an Operating Example of Voltage Monitor 0 Reset.

**Figure 6.5** Operating Example of Voltage Monitor 0 Reset

## 6.5 Voltage Monitor 1 Interrupt

Table 6.2 lists the Procedure for Setting Bits Associated with Voltage Monitor 1 Interrupt. Figure 6.6 shows an Operating Example of Voltage Monitor 1 Interrupt.

To use the voltage monitor 1 interrupt to exit stop mode, set the VW1C1 bit in the VW1C register to 1 (digital filter disabled).

**Table 6.2 Procedure for Setting Bits Associated with Voltage Monitor 1 Interrupt**

Step	When Using Digital Filter	When Using No Digital Filter
1	Select the voltage detection 1 detection voltage by bits VD1S3 to VD1S0 in the VD1LS register.	
2	Set the VCA26 bit in the VCA2 register to 1 (voltage detection 1 circuit enabled).	
3	Wait for $t_d(E-A)$ .	
4	Set the COMPSEL bit in the CMPA register to 1.	
5 (1)	Select the interrupt type by the IRQ1SEL in the CMPA register.	
6	Select the sampling clock of the digital filter by bits VW1F0 and VW1F1 in the VW1C register.	Set the VW1C1 bit in the VW1C register to 1 (digital filter disabled).
7 (2)	Set the VW1C1 bit in the VW1C register to 0 (digital filter enabled).	—
8	Select the interrupt request timing by the VCAC1 bit in the VCAC register and the VW1C7 bit in the VW1C register.	
9	Set the VW1C2 bit in the VW1C register to 0.	
10	Set the CM14 bit in the CM1 register to 0 (low-speed on-chip oscillator on)	—
11	Wait for 2 cycles of the sampling clock of the digital filter	— (No wait time required)
12 (3)	Set the VW1C0 bit in the VW1C register to 1 (voltage monitor 1 interrupt enabled)	

**Notes:**

1. When the VW1C0 bit is set to 0, steps 4 and 5 can be executed simultaneously (with one instruction).
2. When the VW1C0 bit is set to 0, steps 6 and 7 can be executed simultaneously (with one instruction).
3. When making the setting while the voltage monitor 1 interrupt is disabled (the VW1C0 bit in the VW1C register is 0 and the VCA26 bit in the VCA2 register is 0), no interrupt request is generated if  $VCC < V_{det1}$  (or  $VCC > V_{det1}$ ) is detected before enabling the voltage monitor interrupt in step 12. If  $VCC < V_{det1}$  (or  $VCC > V_{det1}$ ) is detected between step 10 and step 12, the VW1C2 bit is set to 1. Read the VW1C2 bit after step 12. If this bit is read as 1, perform the processing to be executed when the above state is detected.

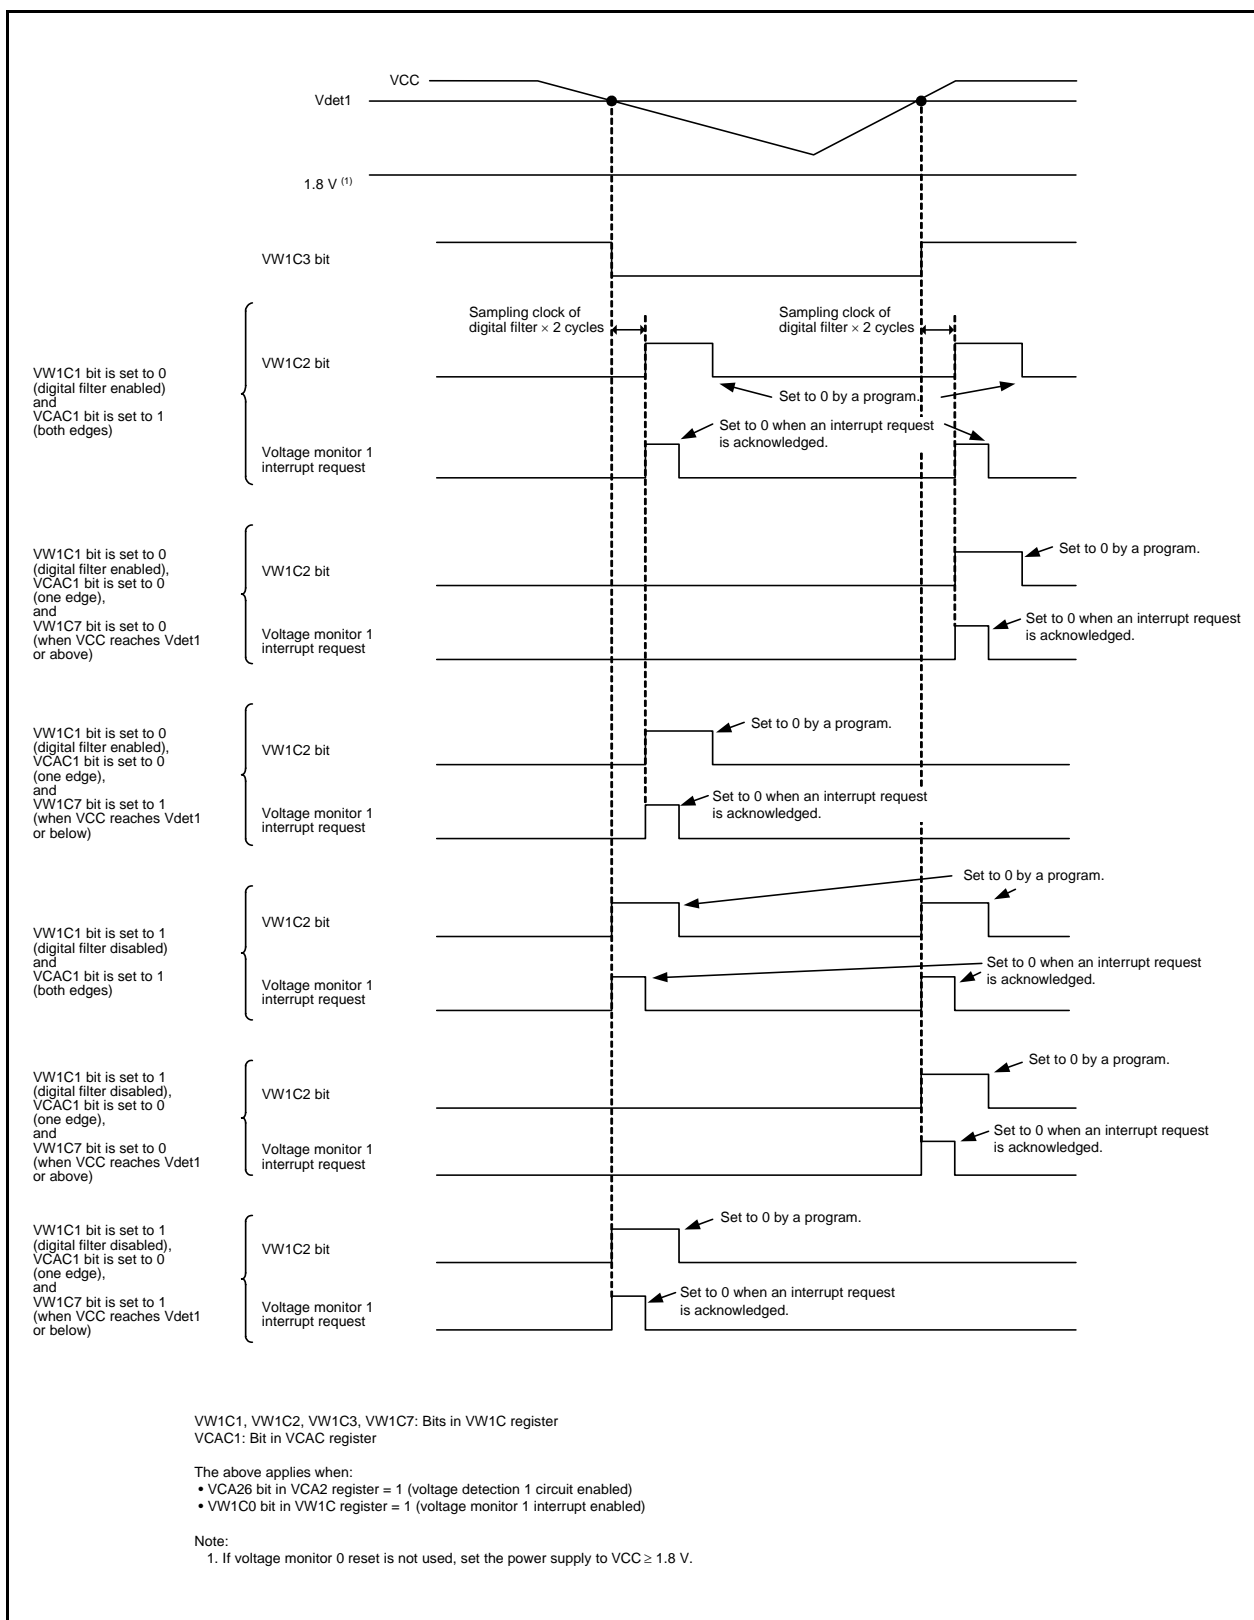

Figure 6.6 Operating Example of Voltage Monitor 1 Interrupt

## 6.6 Voltage Monitor 2 Interrupt

Table 6.3 lists the Procedure for Setting Bits Associated with Voltage Monitor 2 Interrupt. Figure 6.7 shows an Operating Example of Voltage Monitor 2 Interrupt.

To use the voltage monitor 2 interrupt to exit stop mode, set the VW2C1 bit in the VW2C register to 1 (digital filter disabled).

**Table 6.3 Procedure for Setting Bits Associated with Voltage Monitor 2 Interrupt**

Step	When Using Digital Filter	When Using No Digital Filter
1	Set the VCA27 bit in the VCA2 register to 1 (voltage detection 2 circuit enabled).	
2	Wait for $t_d(E-A)$ .	
3	Set the COMPSEL bit in the CMPA register to 1.	
4 (1)	Select the interrupt type by the IRQ2SEL in the CMPA register.	
5	Select the sampling clock of the digital filter by bits VW2F0 and VW2F1 in the VW2C register.	Set the VW2C1 bit in the VW2C register to 1 (digital filter disabled).
6 (2)	Set the VW2C1 bit in the VW2C register to 0 (digital filter enabled).	—
7	Select the interrupt request timing by the VCAC2 bit in the VCAC register and the VW2C7 bit in the VW2C register.	
8	Set the VW2C2 bit in the VW2C register to 0.	
9	Set the CM14 bit in the CM1 register to 0 (low-speed on-chip oscillator on).	—
10	Wait for 2 cycles of the sampling clock of the digital filter.	— (No wait time required)
11 (3)	Set the VW2C0 bit in the VW2C register to 1 (voltage monitor 2 interrupt enabled).	

Notes:

1. When the VW2C0 bit is set to 0, steps 3 and 4 can be executed simultaneously (with one instruction).
2. When the VW2C0 bit is set to 0, steps 5 and 6 can be executed simultaneously (with one instruction).
3. When making the setting while the voltage monitor 2 interrupt is disabled (the VW2C0 bit in the VW2C register is 0 and the VCA27 bit in the VCA2 register is 0), no interrupt request is generated if  $VCC < V_{det2}$  (or  $VCC > V_{det2}$ ) is detected before enabling the voltage monitor interrupt in step 11. If  $VCC < V_{det2}$  (or  $VCC > V_{det2}$ ) is detected between step 9 and step 11, the VW2C2 bit is set to 1. Read the VW2C2 bit after step 11. If this bit is read as 1, perform the processing to be executed when the above state is detected.

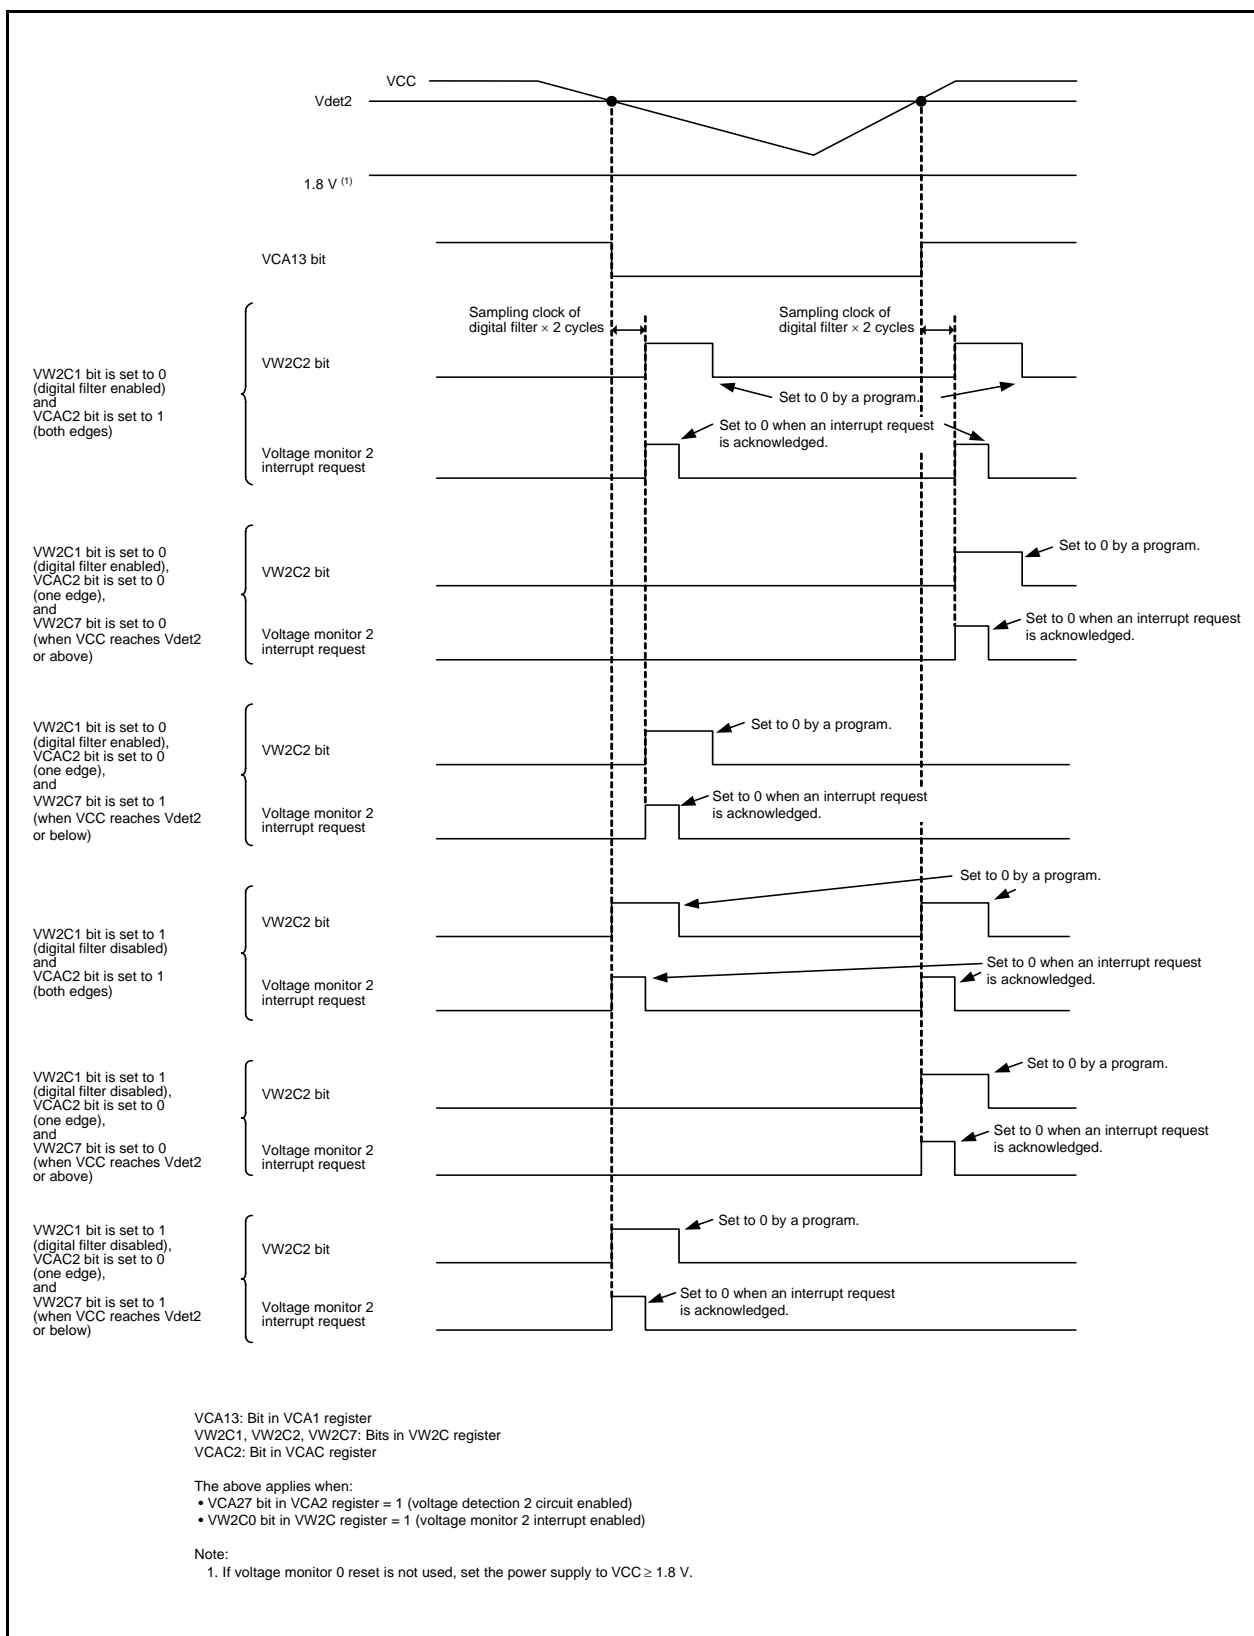

Figure 6.7 Operating Example of Voltage Monitor 2 Interrupt

## 7. I/O Ports

There are 27 I/O ports P0, P1, P2\_0 to P2\_2, P3\_1, P3\_3 to P3\_5, P3\_7, and P4\_5 to P4\_7 (P4\_6 and P4\_7 can be used as I/O ports if the XIN clock oscillation circuit is not used).

If the A/D converter is not used, P4\_2 can be used as an input-only port.

Table 7.1 lists an Overview of I/O Ports.

**Table 7.1 Overview of I/O Ports**

Ports	I/O	Type of Output	I/O Setting	Internal Pull-Up Resister	Drive Capacity Switch	Input Level Switch
P0	I/O	CMOS3 state	Set in 1-bit units	Set in 4-bit units <sup>(1)</sup>	Set in 4-bit units <sup>(3)</sup>	Set in 8-bit units <sup>(4)</sup>
P1	I/O	CMOS3 state	Set in 1-bit units	Set in 4-bit units <sup>(1)</sup>	Set in 1-bit units <sup>(2)</sup>	Set in 8-bit units <sup>(4)</sup>
P2_0 to P2_2	I/O	CMOS3 state	Set in 1-bit units	Set in 3-bit units <sup>(1)</sup>	Set in 1-bit units <sup>(2)</sup>	Set in 3-bit units <sup>(4)</sup>
P3_1, P3_3	I/O	CMOS3 state	Set in 1-bit units	Set in 2-bit units <sup>(1)</sup>	Set in 2-bit units <sup>(3)</sup>	Set in 5-bit units <sup>(4)</sup>
P3_4, P3_5, P3_7	I/O	CMOS3 state	Set in 1-bit units	Set in 3-bit units <sup>(1)</sup>	Set in 3-bit units <sup>(3)</sup>	
P4_5, P4_6 <sup>(5)</sup> , P4_7 <sup>(5)</sup>	I/O	CMOS3 state	Set in 1-bit units	Set in 3-bit units <sup>(1)</sup>	Set in 3-bit units <sup>(3)</sup>	Set in 4-bit units <sup>(4)</sup>
P4_2 <sup>(6)</sup>	I	(No output function)	None	None	None	

Notes:

1. In input mode, whether an internal pull-up resistor is connected or not can be selected by registers PUR0 and PUR1.
2. Whether the drive capacity of the output transistor is set to low or high can be selected using registers P1DDR and P2DDR.
3. Whether the drive capacity of the output transistor is set to low or high can be selected using registers DRR0 and DRR1.
4. The input threshold value can be selected among three voltage levels (0.35 VCC, 0.50 VCC, and 0.70 VCC) using registers VLT0 and VLT1.
5. When the XIN clock oscillation circuit is not used, these ports can be used as I/O ports.
6. When the A/D converter is not used, this port can be used as an input-only ports.

### 7.1 Functions of I/O Ports

The PDi\_j (j = 0 to 7) bit in the PDi (i = 0 to 4) register controls I/O of the ports P0, P1, P2\_0 to P2\_2, P3\_1, P3\_3 to P3\_5, P3\_7, and P4\_5 to P4\_7. The Pi register consists of a port latch to hold output data and a circuit to read pin states.

Figures 7.1 to 7.10 show the Configurations of I/O Ports. Table 7.2 lists the Functions of I/O Ports.

**Table 7.2 Functions of I/O Ports**

Operation When Accessing Pi Register	Value of PDi_j Bit in PDi Register <sup>(1)</sup>	
	When PDi_j Bit is Set to 0 (Input Mode)	When PDi_j Bit is Set to 1 (Output Mode)
Read	Read the pin input level.	Read the port latch.
Write	Write to the port latch.	Write to the port latch. The value written to the port latch is output from the pin.

i = 0 to 4, j = 0 to 7

Note:

1. Nothing is assigned to bits PD4\_0 to PD4\_2.

## 7.2 Effect on Peripheral Functions

I/O ports function as I/O ports for peripheral functions (refer to **Table 1.4 Pin Name Information by Pin Number**).

Table 7.3 lists the Setting of PDi<sub>j</sub> Bit when Functioning as I/O Ports for Peripheral Functions (i = 0 to 4, j = 0 to 7).

Refer to the description of each function for information on how to set peripheral functions.

**Table 7.3 Setting of PDi<sub>j</sub> Bit when Functioning as I/O Ports for Peripheral Functions (i = 0 to 4, j = 0 to 7)**

I/O of Peripheral Function	PDi <sub>j</sub> Bit Settings for Shared Pin Function
Input	Set this bit to 0 (input mode).
Output	This bit can be set to either 0 or 1 (output regardless of the port setting).

## 7.3 Pins Other than I/O Ports

Figure 7.11 shows the Configuration of I/O Pins.

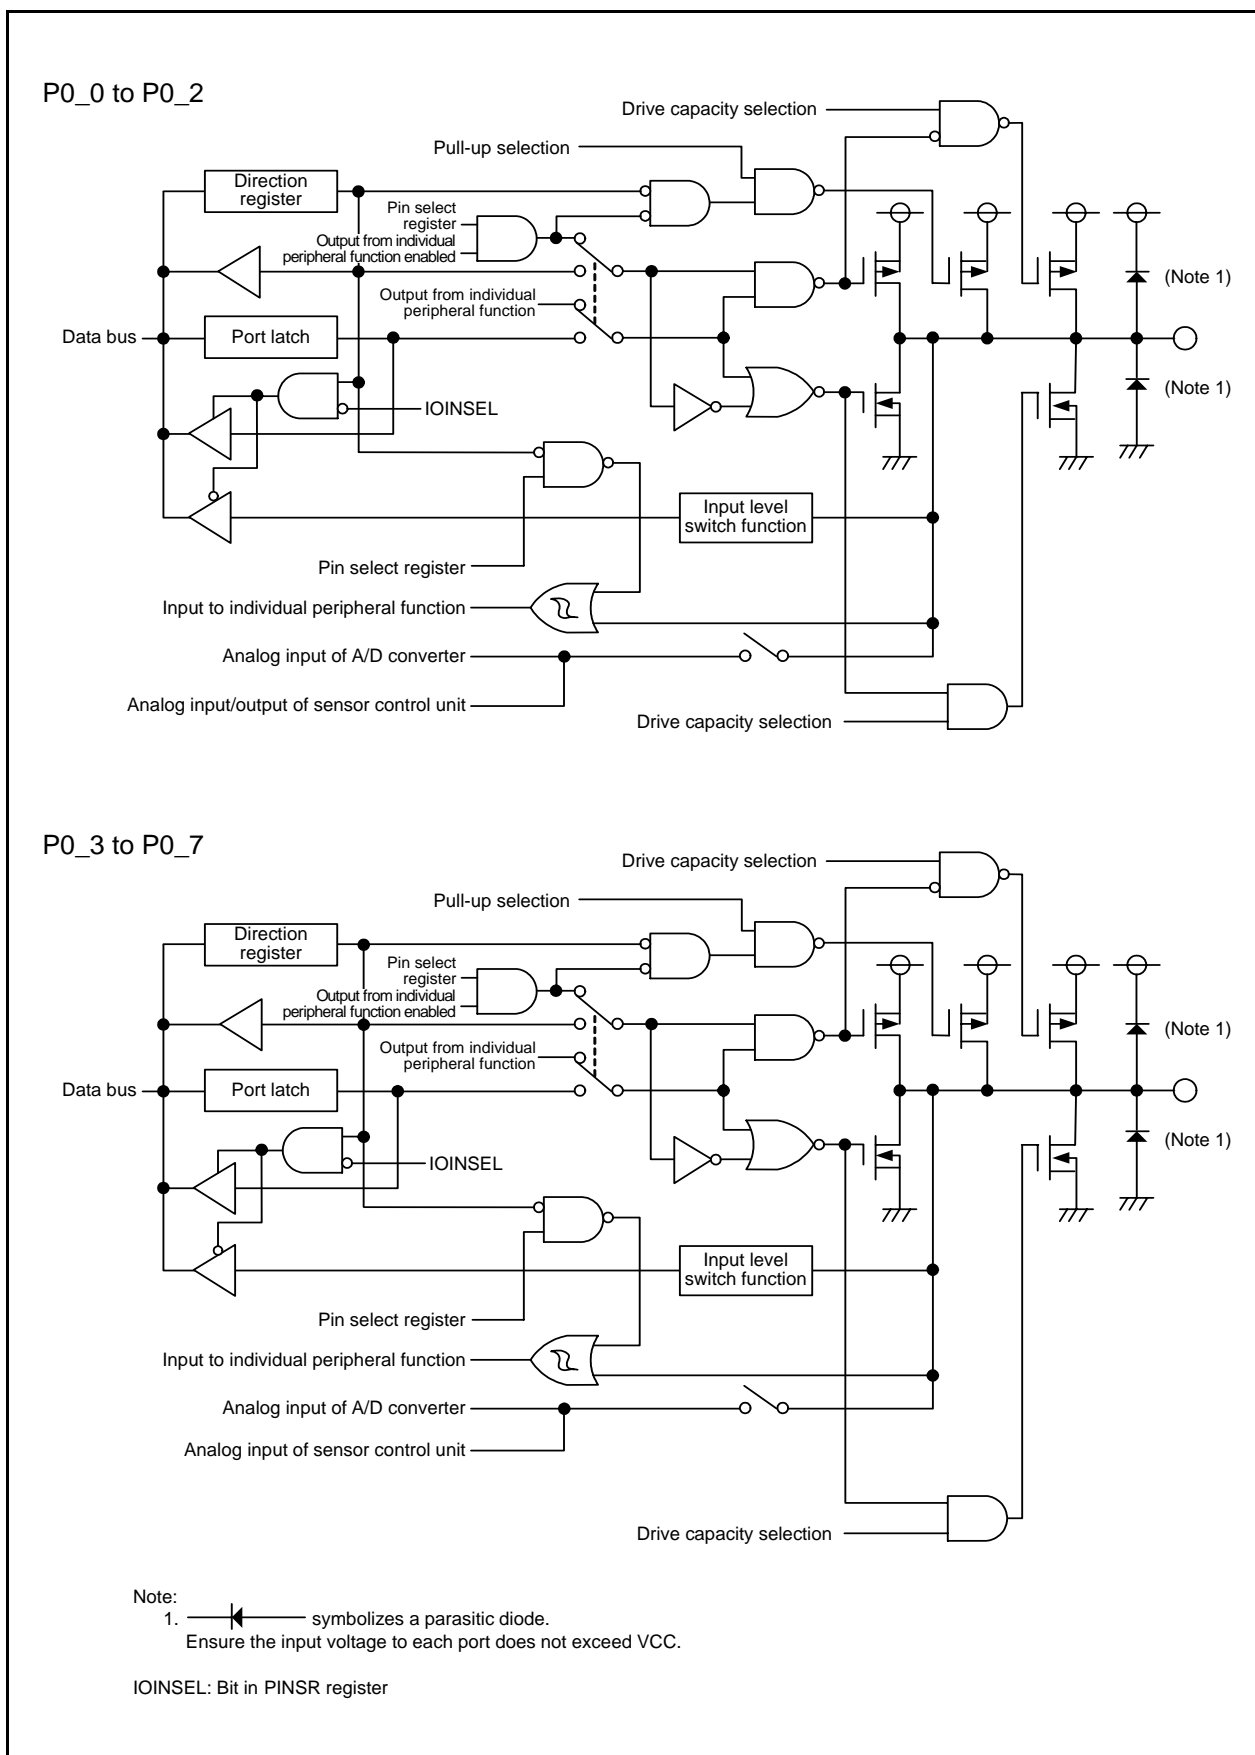

Figure 7.1 Configuration of I/O Ports (1)

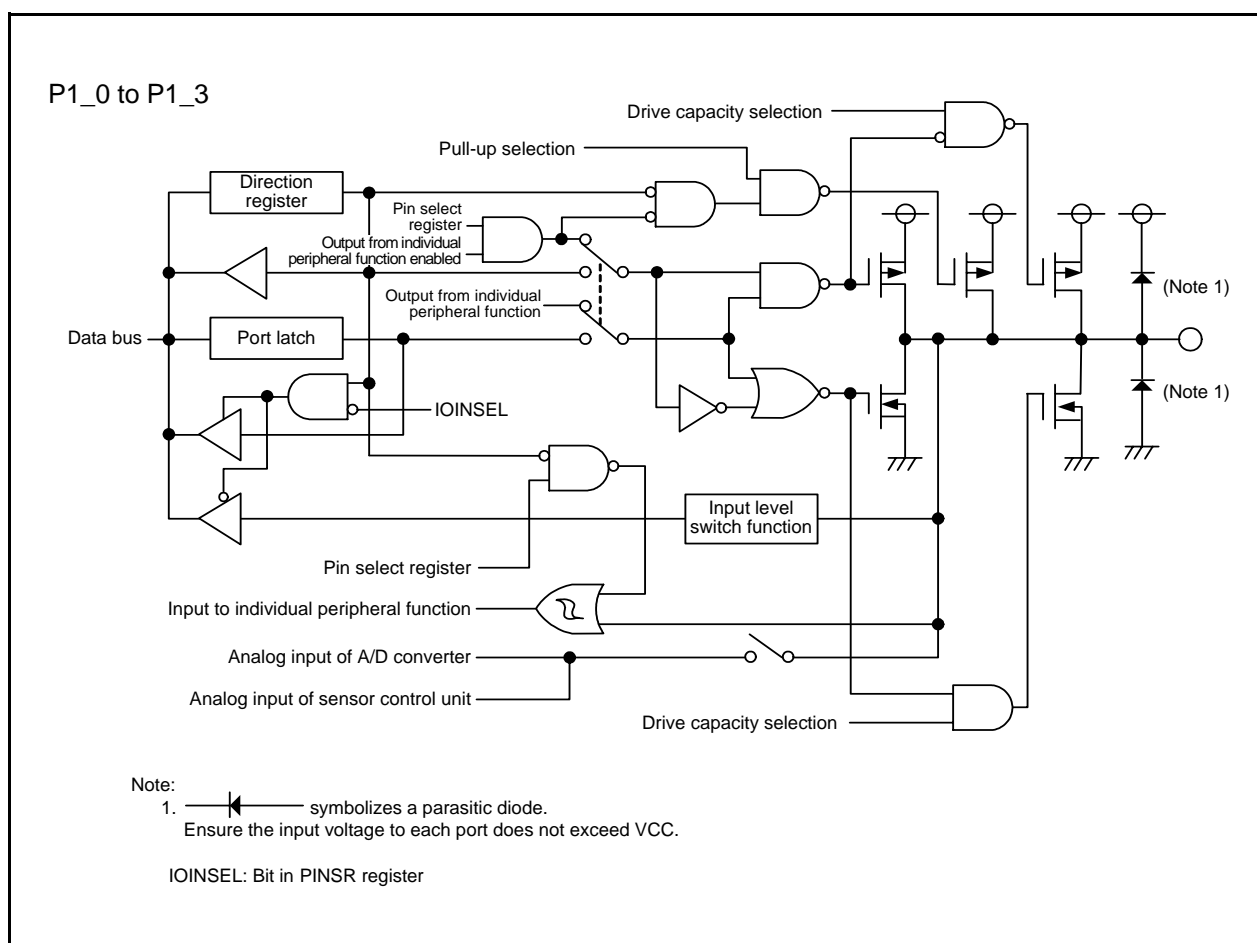

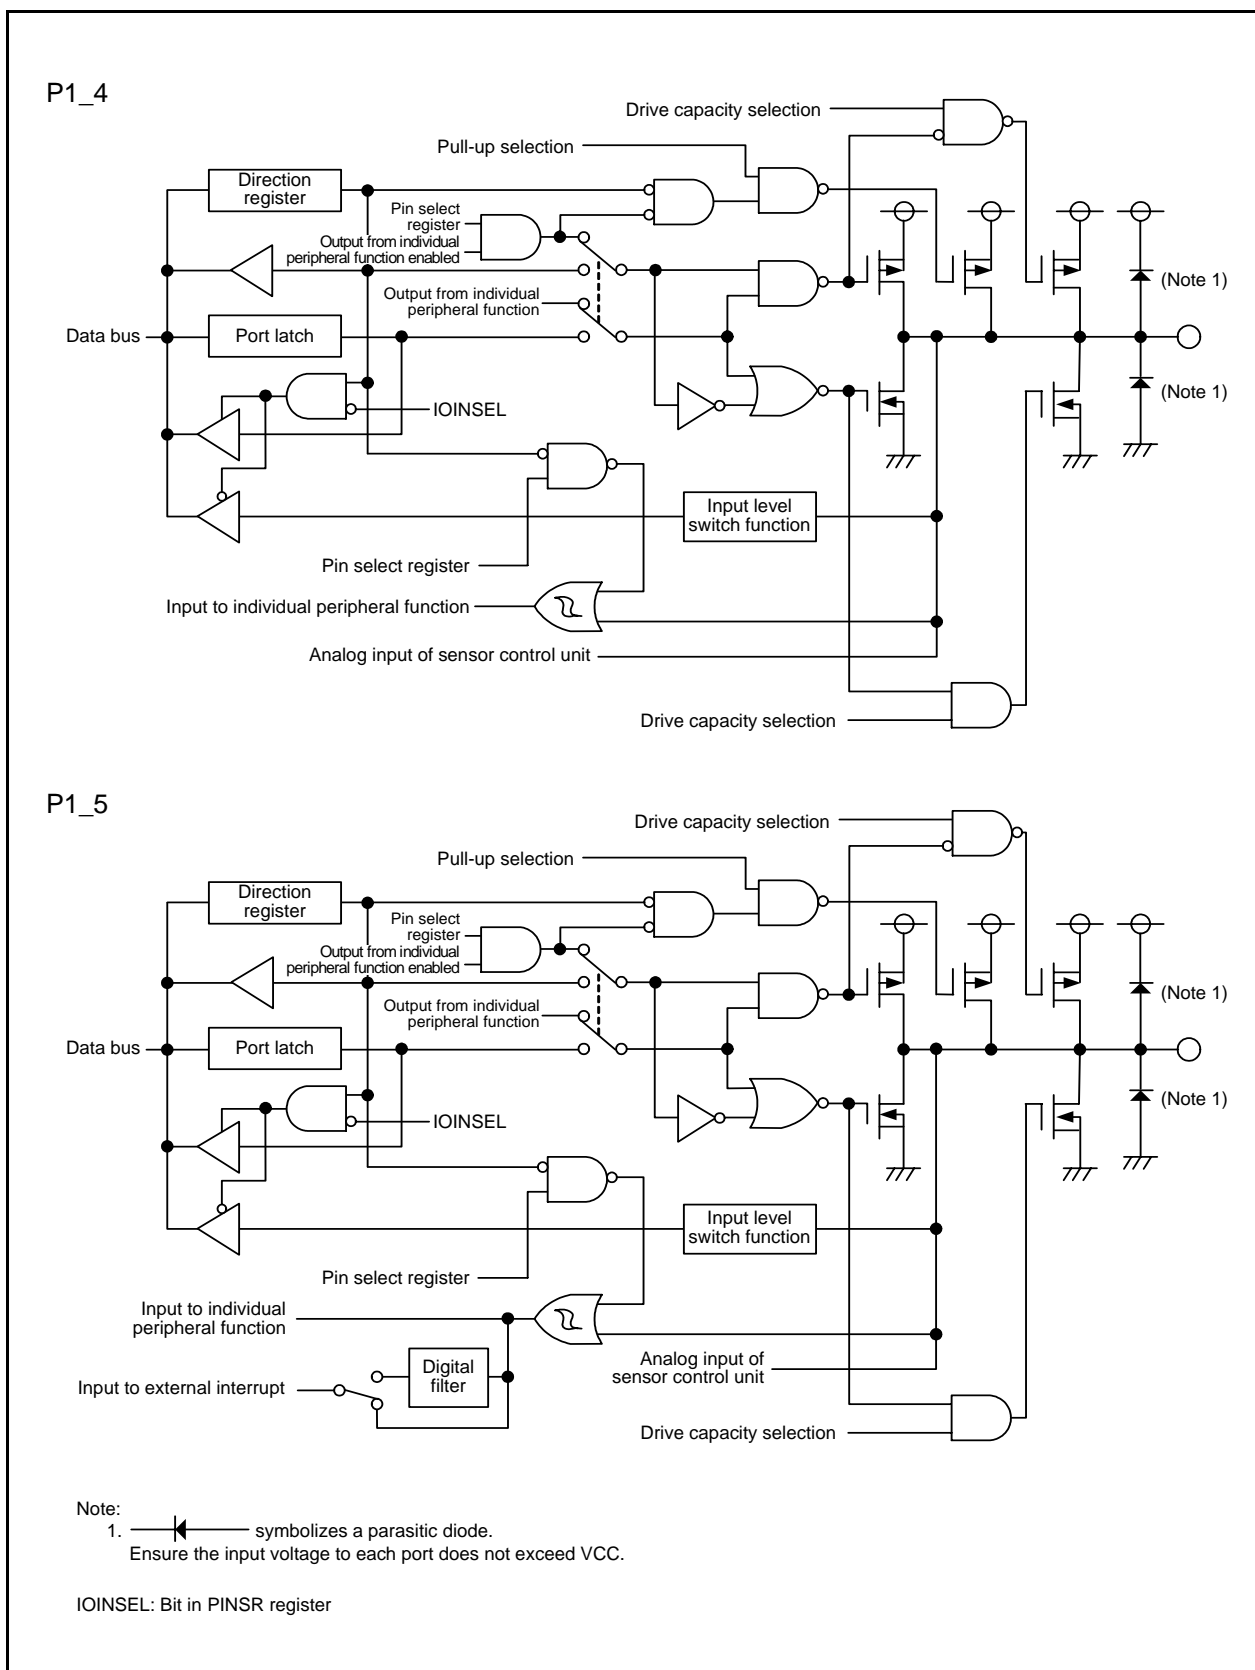

Figure 7.2 Configuration of I/O Ports (2)

**Figure 7.3 Configuration of I/O Ports (3)**

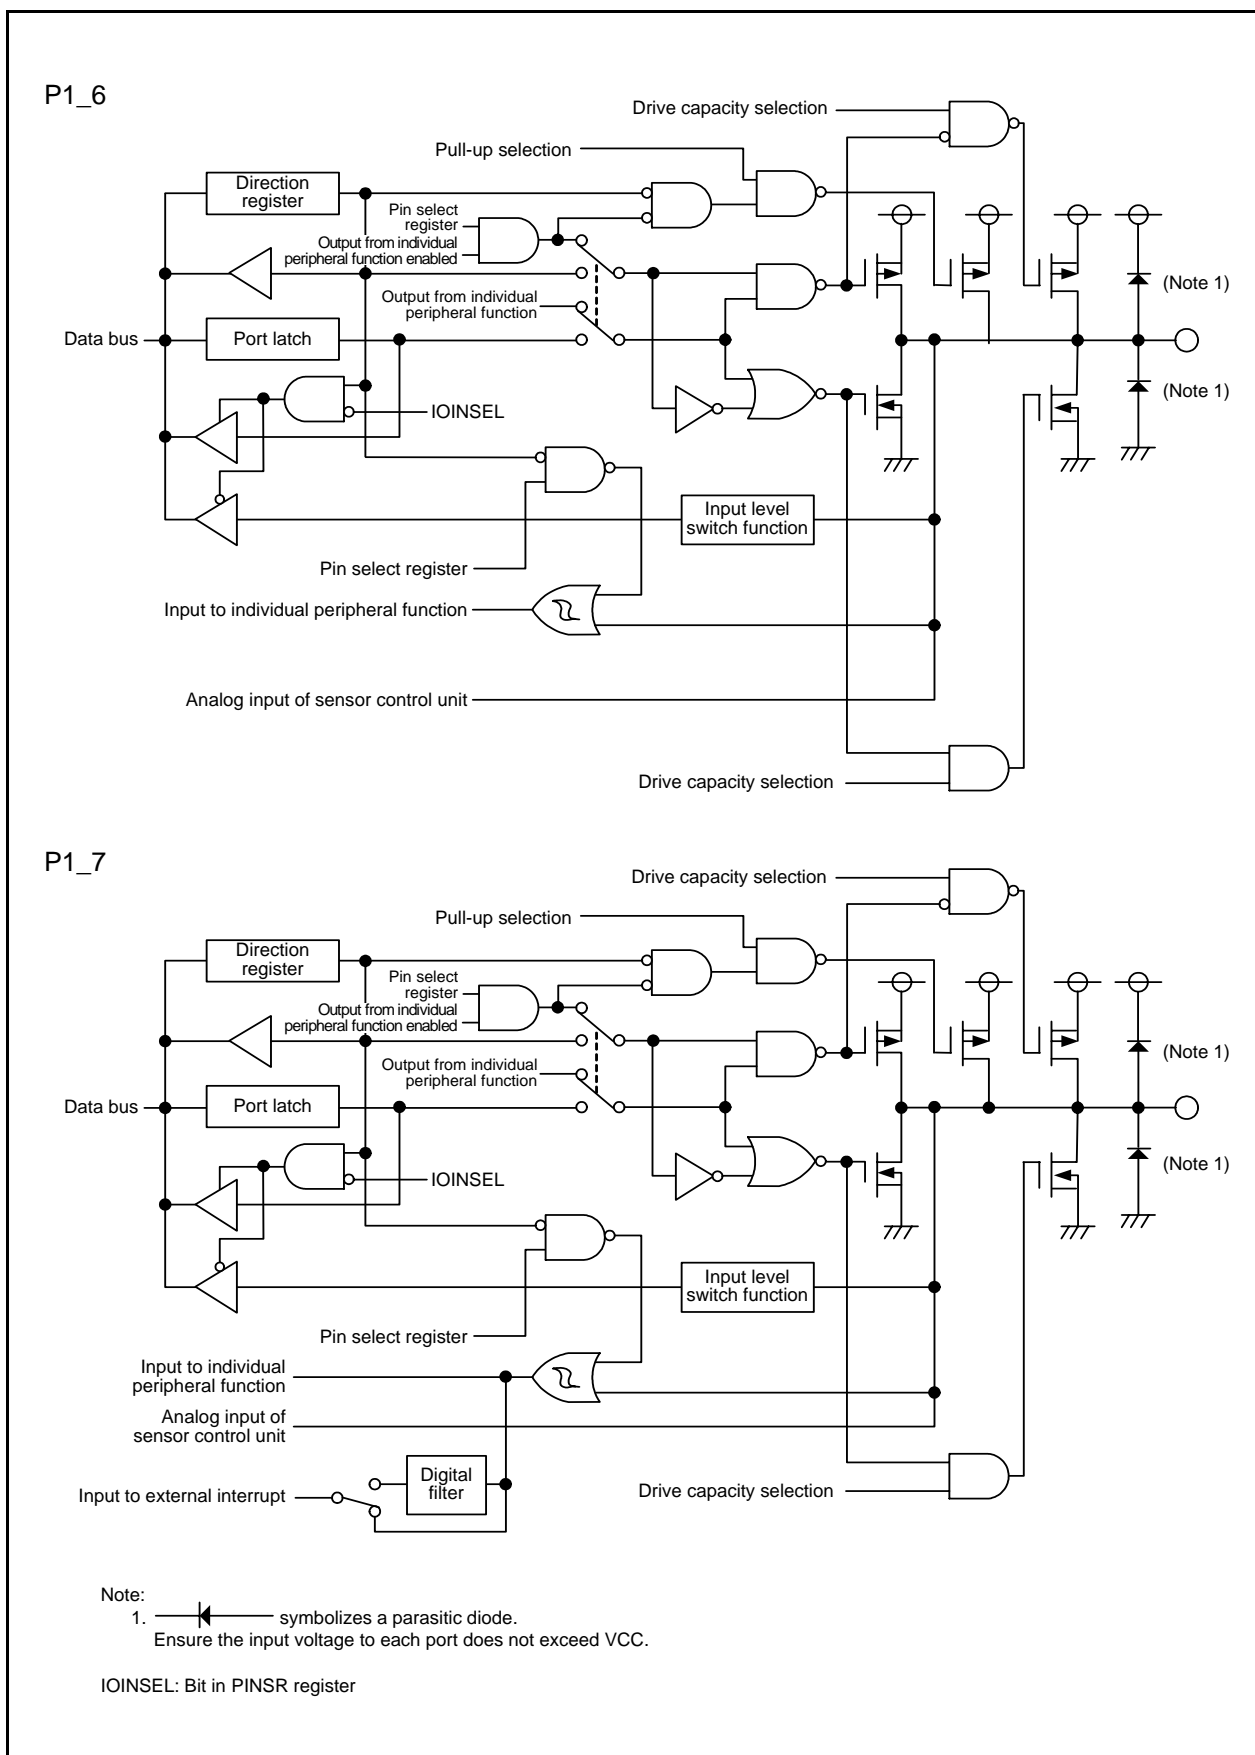

Figure 7.4 Configuration of I/O Ports (4)

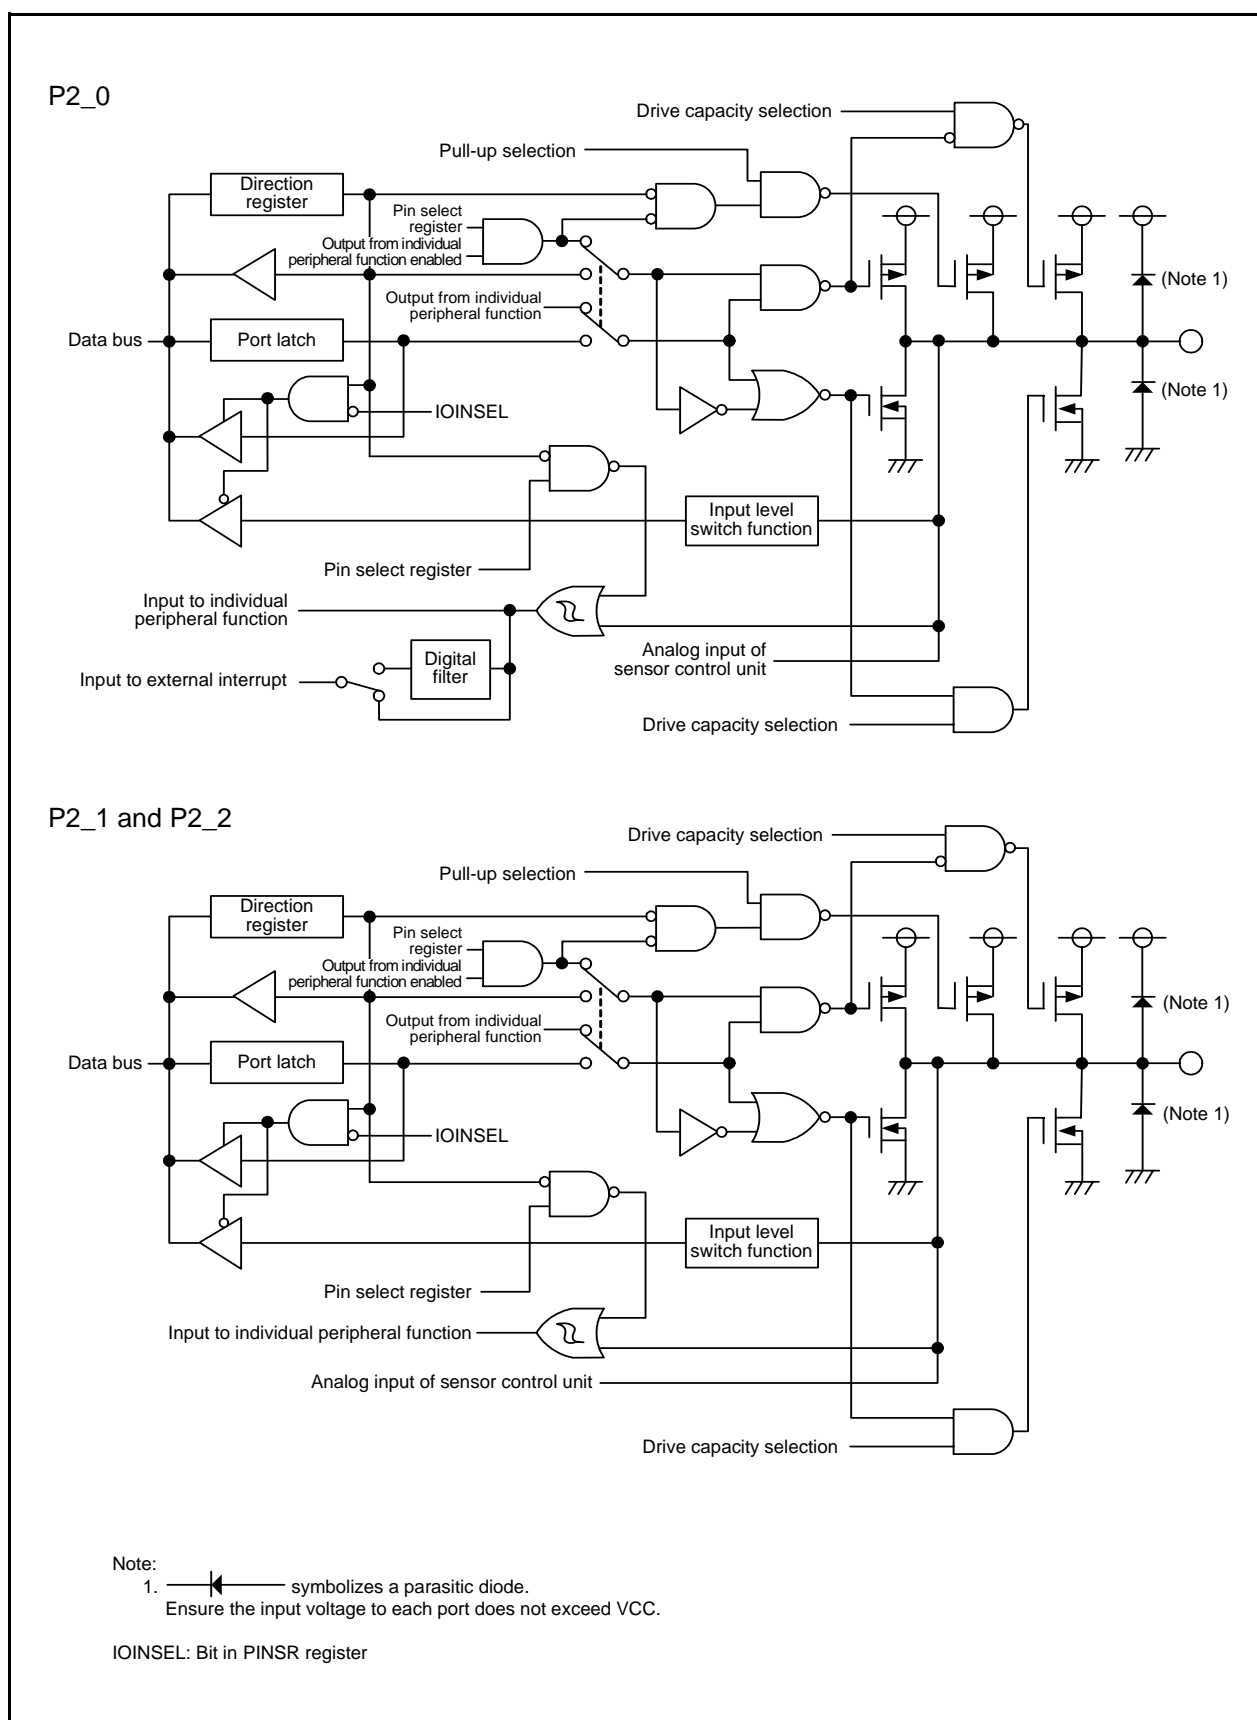

Figure 7.5 Configuration of I/O Ports (5)

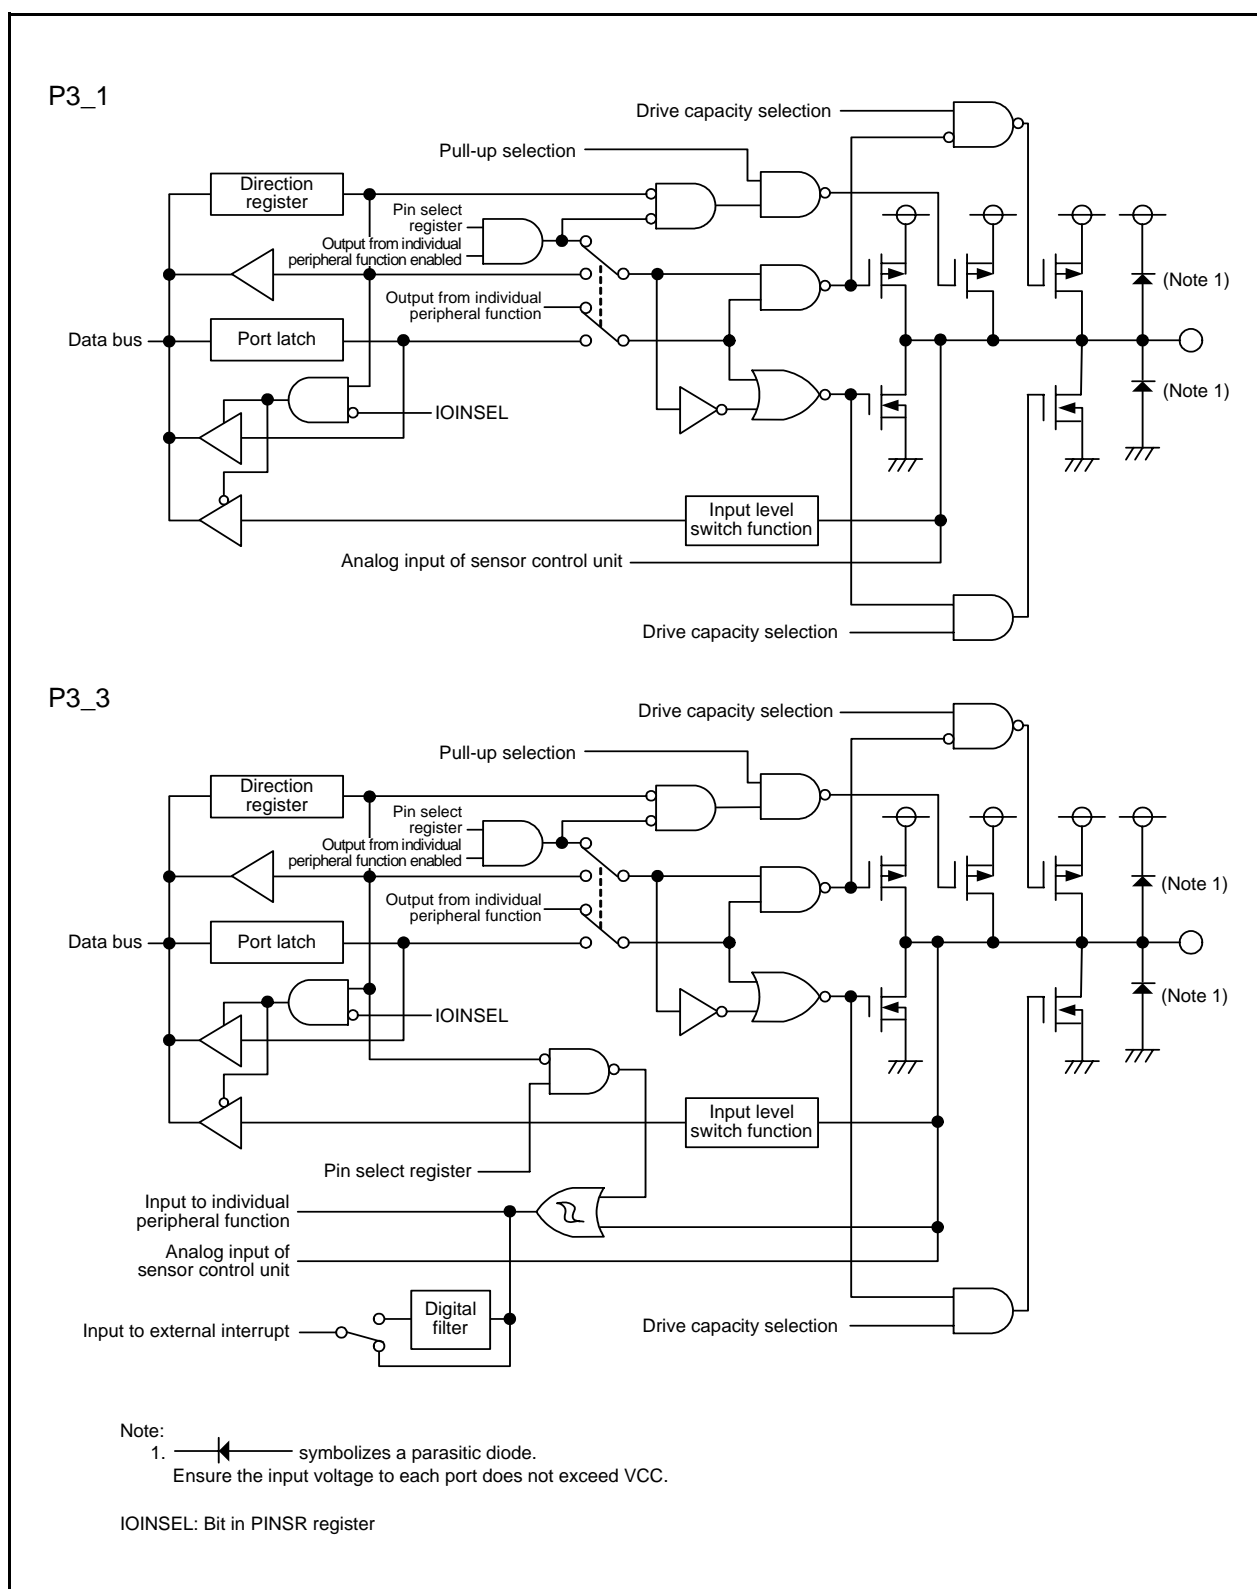

Figure 7.6 Configuration of I/O Ports (6)

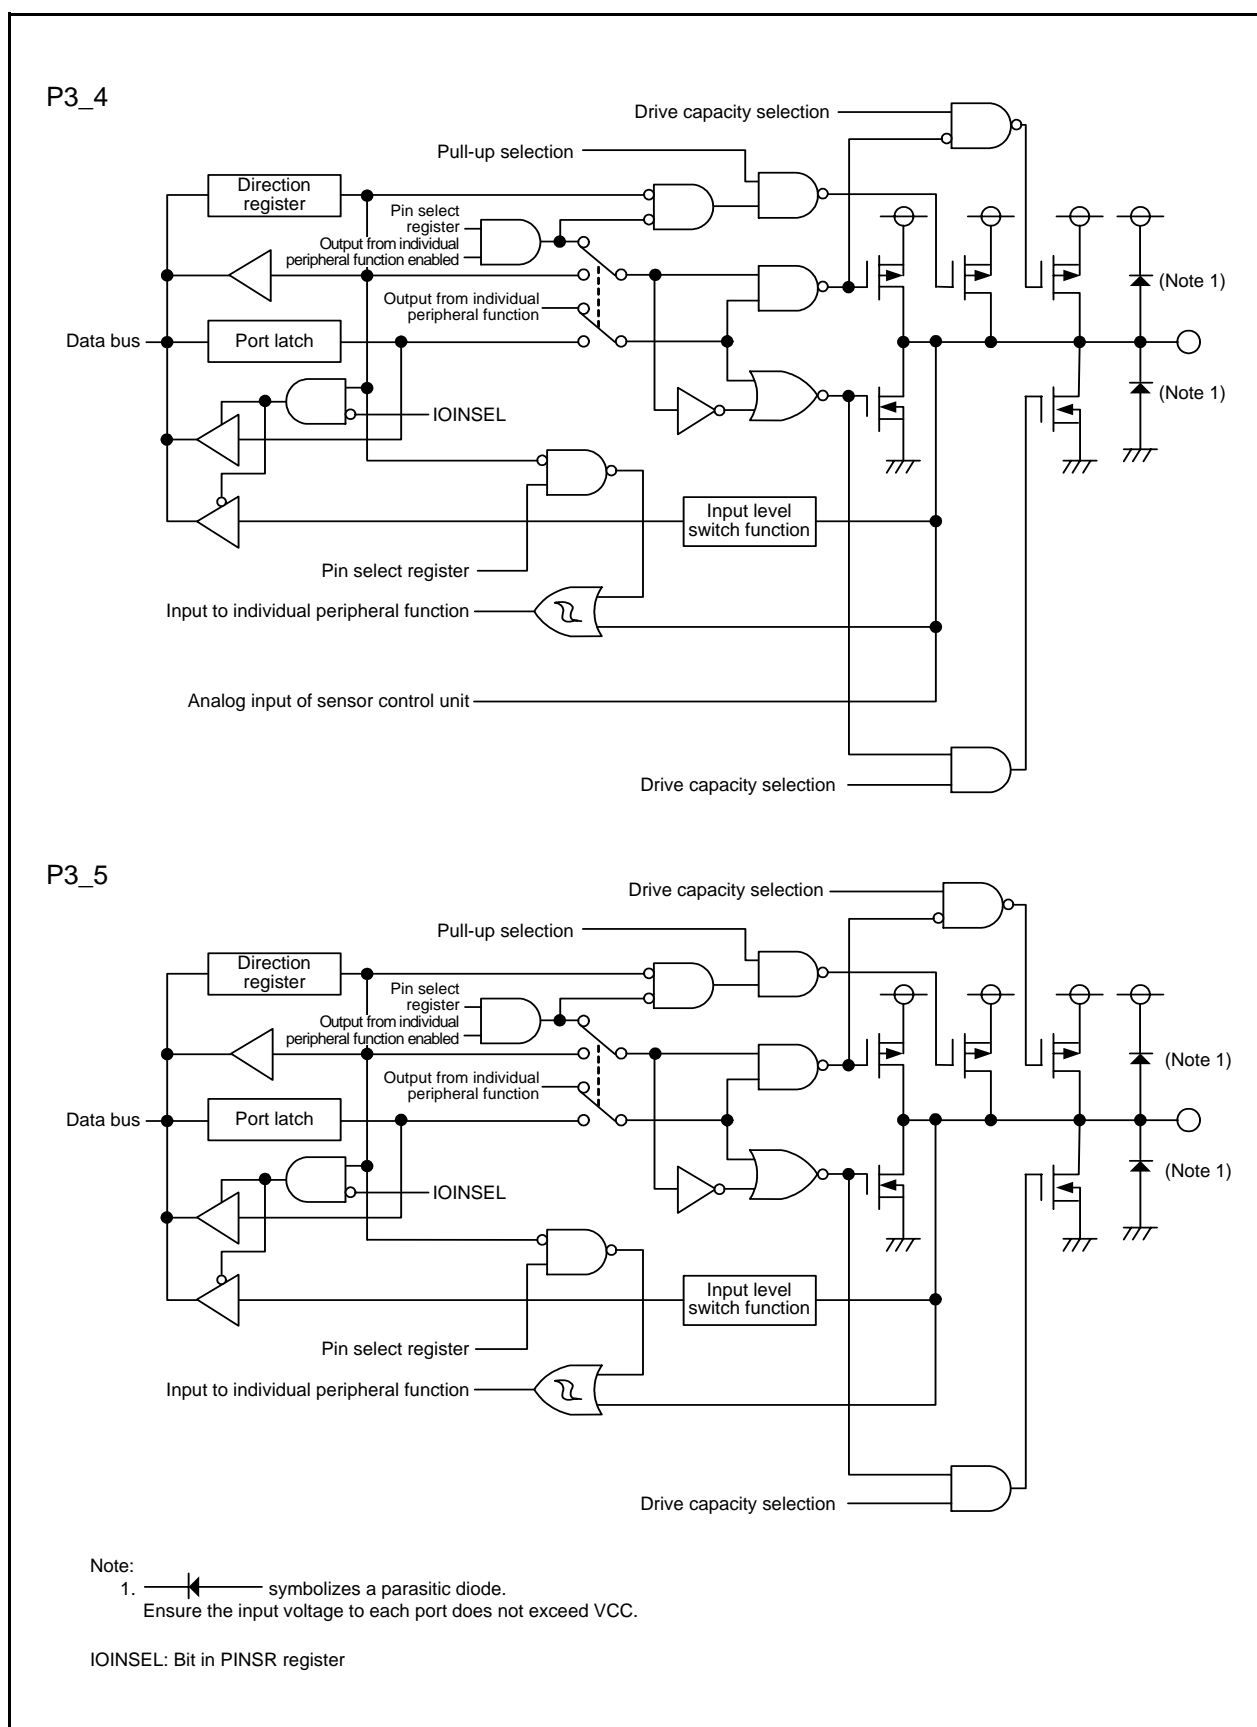

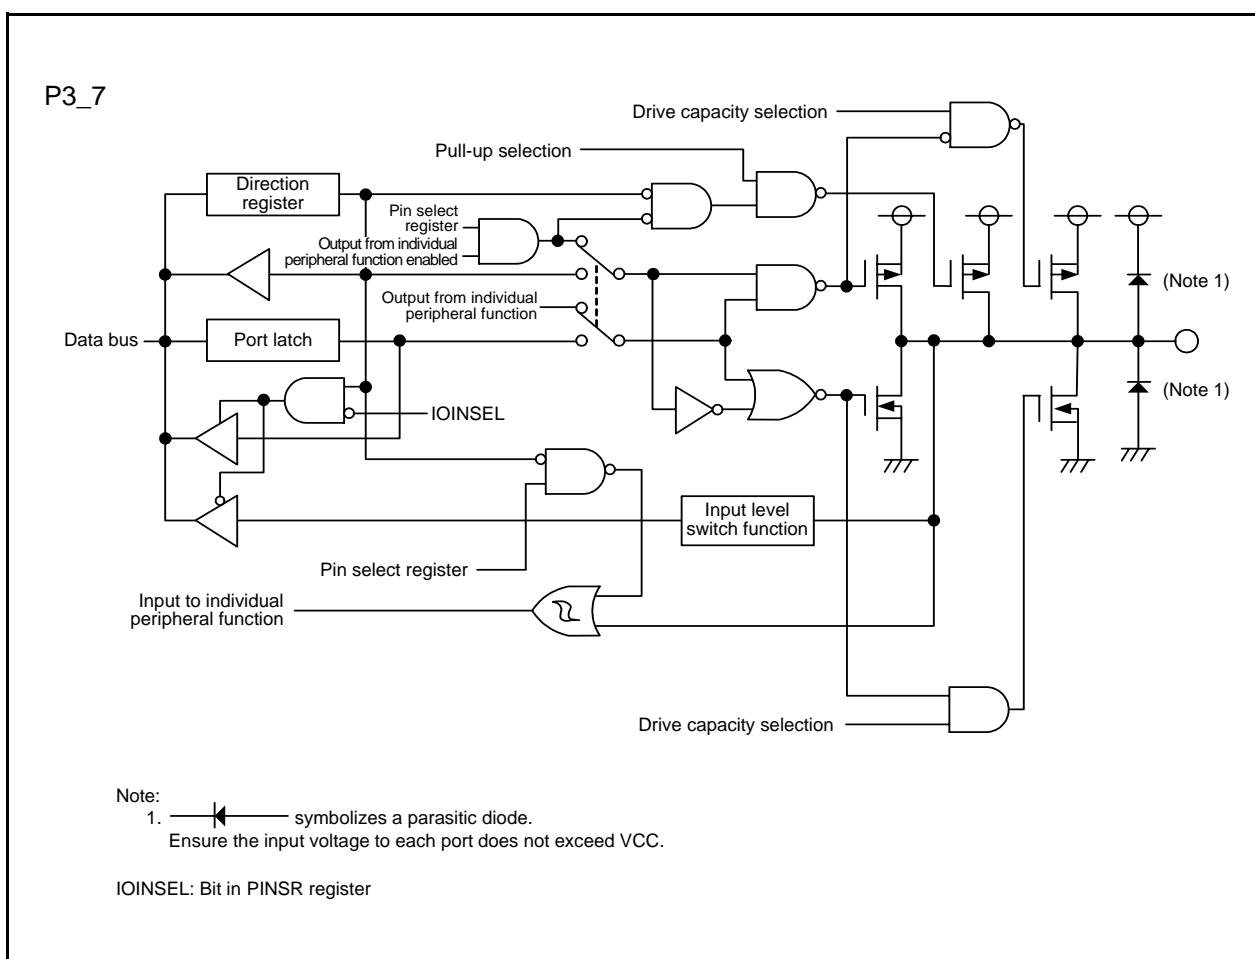

Figure 7.7 Configuration of I/O Ports (7)

**Figure 7.8 Configuration of I/O Ports (8)**

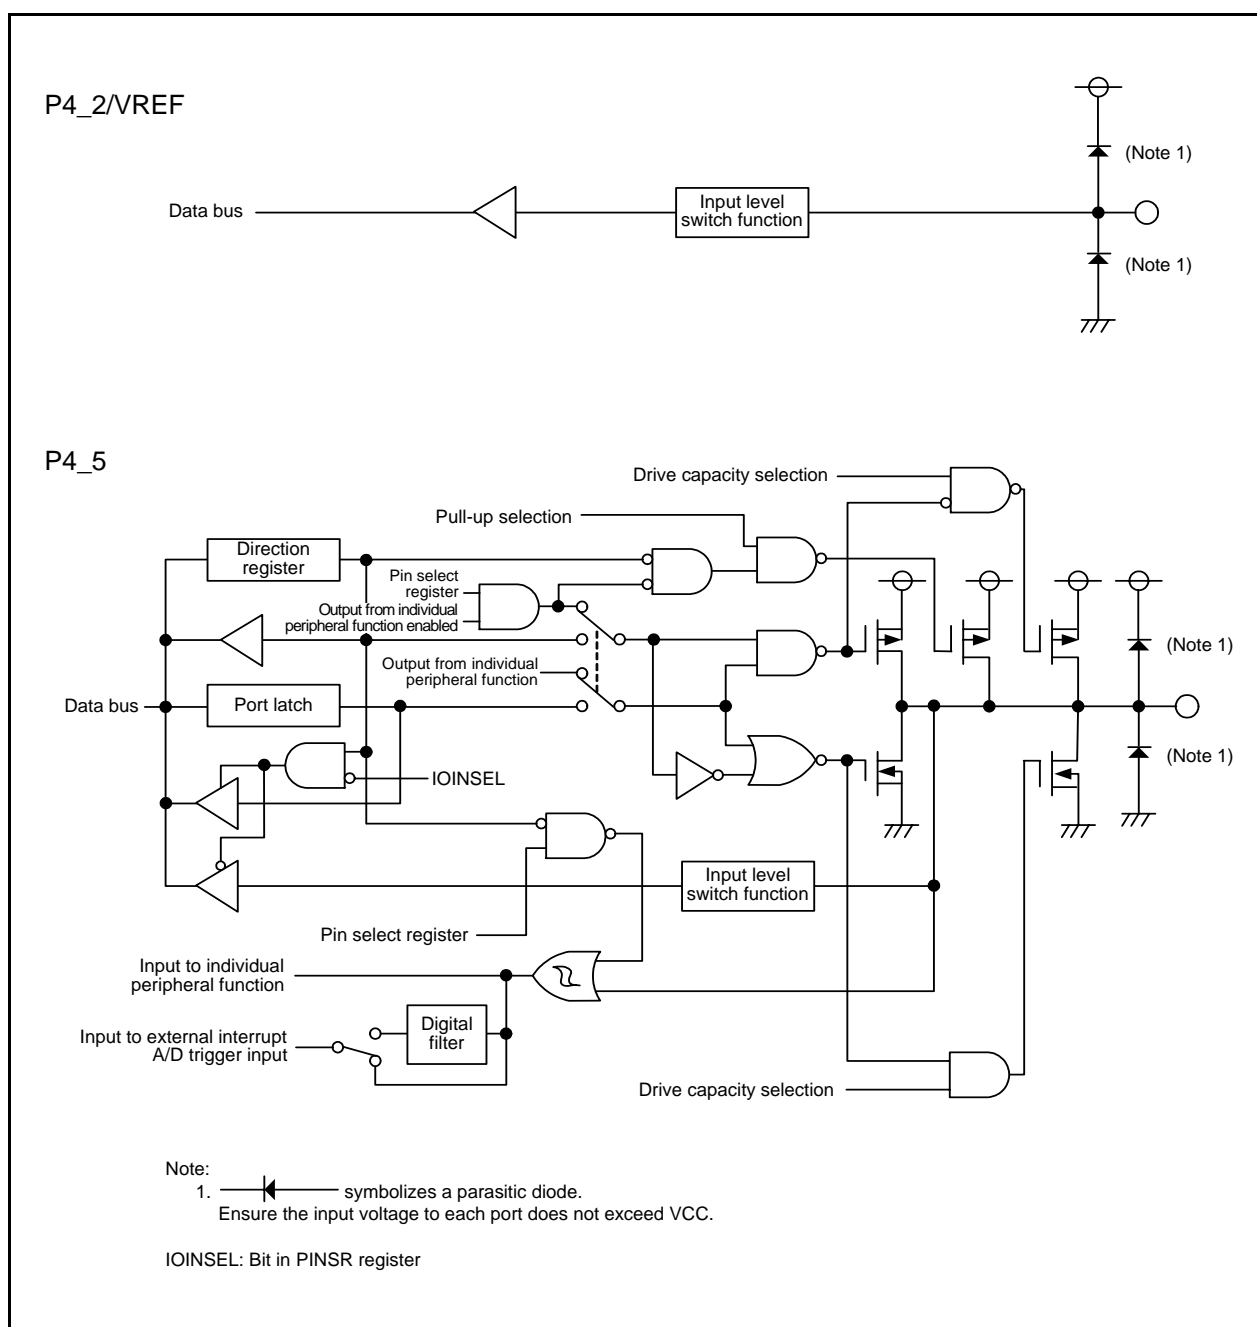

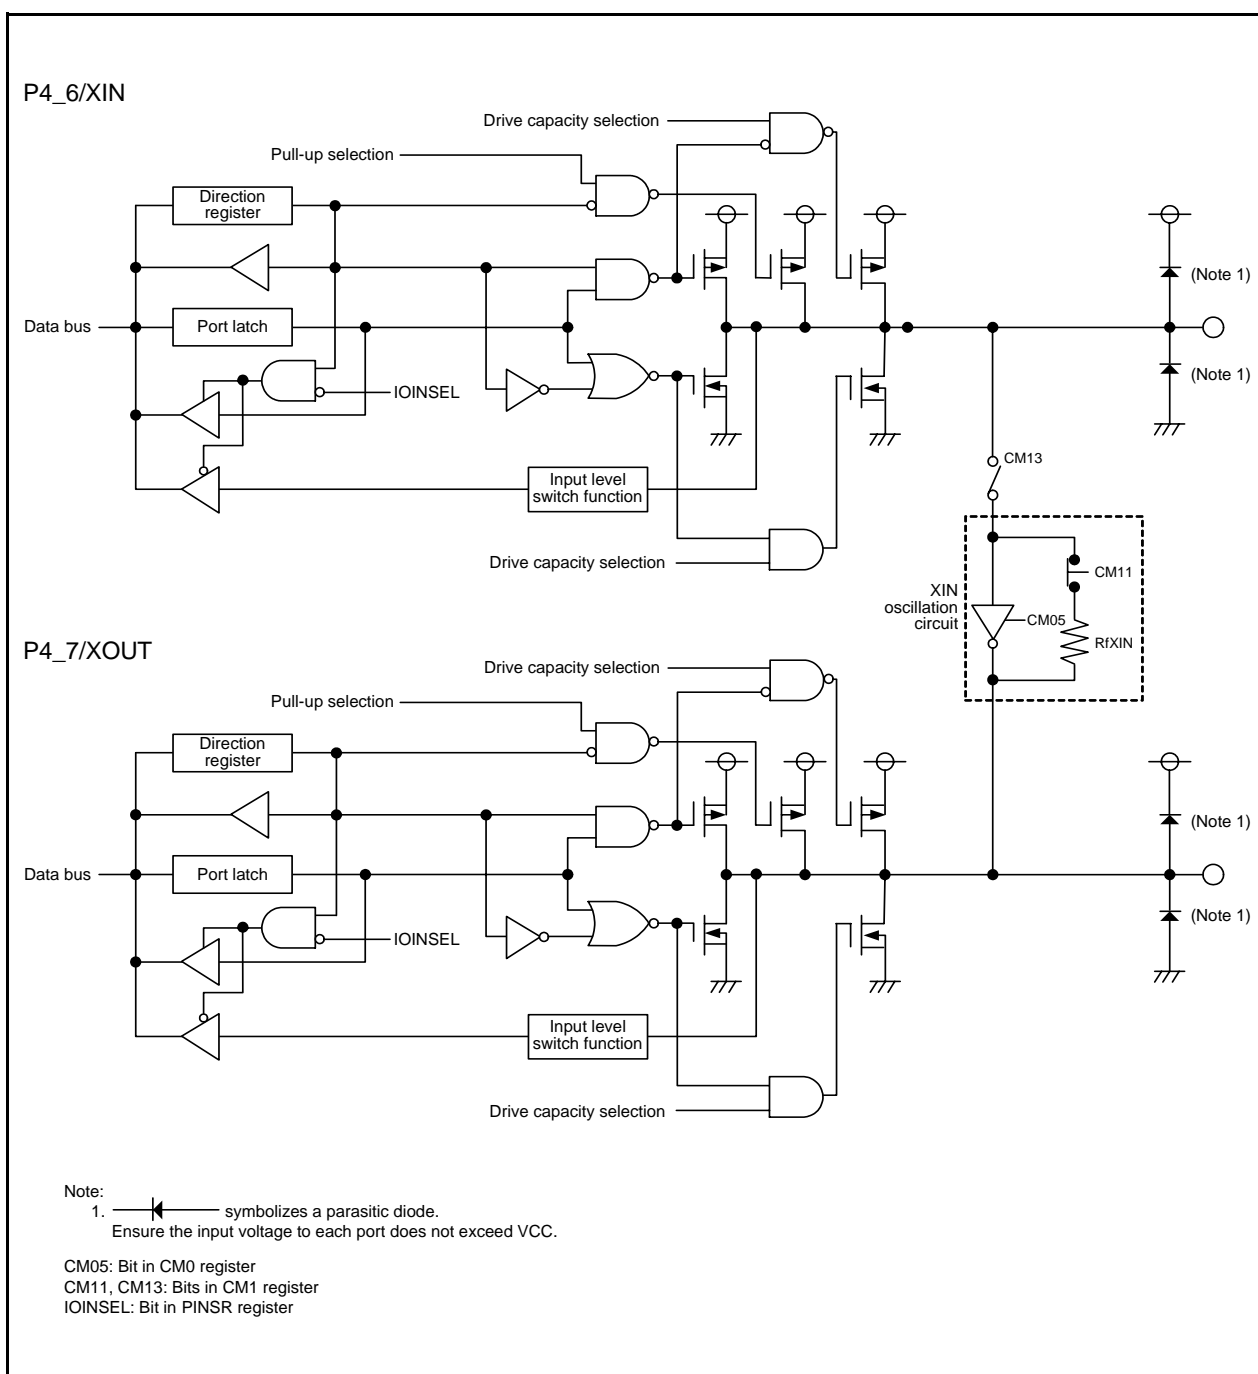

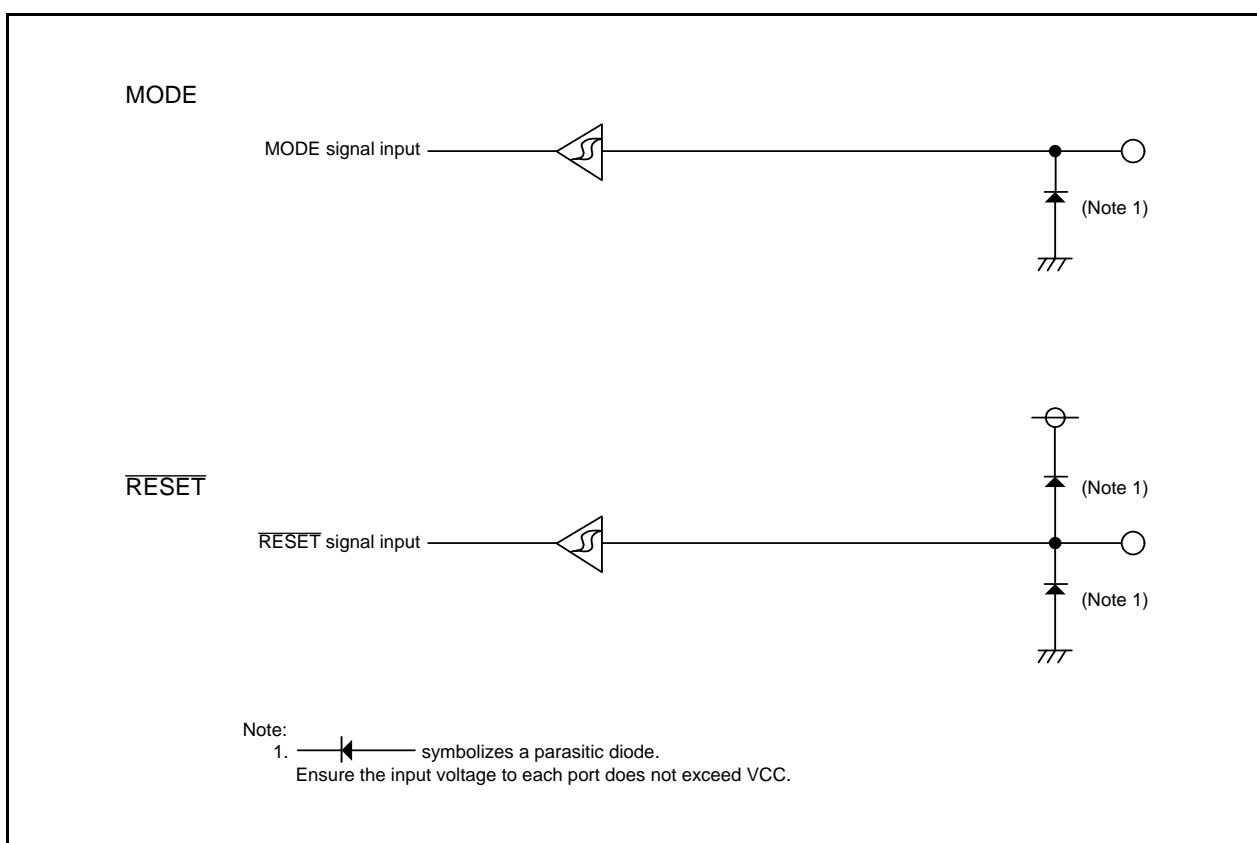

Figure 7.9 Configuration of I/O Ports (9)

**Figure 7.10 Configuration of I/O Ports (10)**

## 7.4 Registers

### 7.4.1 Port Pi Direction Register (PDi) (i = 0 to 4)

Address 00E2h (PD0 <sup>(1)</sup>), 00E3h (PD1), 00E6h (PD2 <sup>(2)</sup>), 00E7h (PD3 <sup>(3)</sup>), 00EAh (PD4 <sup>(4)</sup>)

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	PDi_7	PDi_6	PDi_5	PDi_4	PDi_3	PDi_2	PDi_1	PDi_0
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	PDi_0	Port Pi_0 direction bit	0: Input mode (functions as an input port) 1: Output mode (functions as an output port)	R/W
b1	PDi_1	Port Pi_1 direction bit		R/W
b2	PDi_2	Port Pi_2 direction bit		R/W
b3	PDi_3	Port Pi_3 direction bit		R/W
b4	PDi_4	Port Pi_4 direction bit		R/W
b5	PDi_5	Port Pi_5 direction bit		R/W
b6	PDi_6	Port Pi_6 direction bit		R/W
b7	PDi_7	Port Pi_7 direction bit		R/W

**Notes:**

1. Write to the PD0 register with the next instruction after that used to set the PRC2 bit in the PRCR register to 1 (write enabled).
2. Bits PD2\_3 to PD2\_7 in the PD2 register are reserved bits. If it is necessary to set bits PD2\_3 and PD2\_7, set to 0. When read, the content is 0.
3. Bits PD3\_0, PD3\_2, and PD3\_6 in the PD3 register are reserved bits. If it is necessary to set bits PD3\_0, PD3\_2 and PD3\_6, set to 0. When read, the content is 0.
4. Bits PD4\_0 to PD4\_2 in the PD4 register are unavailable on this MCU. If it is necessary to set bits PD4\_0 to PD4\_2 set to 0. When read, the content is 0. Bits PD4\_3 and PD4\_4 are reserved bits. If it is necessary to set bits PD4\_3 and PD4\_4, set to 0. When read, the content is 0.

The PDi register selects whether I/O ports are used for input or output. Each bit in the PDi register corresponds to one port.

### 7.4.2 Port Pi Register (Pi) (i = 0 to 4)

Address 00E0h (P0), 00E1h (P1), 00E4h (P2 <sup>(1)</sup>), 00E5h (P3 <sup>(2)</sup>), 00E8h (P4 <sup>(3)</sup>)

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	Pi_7	Pi_6	Pi_5	Pi_4	Pi_3	Pi_2	Pi_1	Pi_0
After Reset	X	X	X	X	X	X	X	X

Bit	Symbol	Bit Name	Function	R/W
b0	Pi_0	Port Pi_0 bit	0: "L" level 1: "H" level	R/W
b1	Pi_1	Port Pi_1 bit		R/W
b2	Pi_2	Port Pi_2 bit		R/W
b3	Pi_3	Port Pi_3 bit		R/W
b4	Pi_4	Port Pi_4 bit		R/W
b5	Pi_5	Port Pi_5 bit		R/W
b6	Pi_6	Port Pi_6 bit		R/W
b7	Pi_7	Port Pi_7 bit		R/W

Notes:

1. Bits P2\_3 to P2\_7 in the P2 register are reserved bits. If it is necessary to set bits P2\_3 and P2\_7, set to 0. When read, the content is 0.
2. Bits P3\_0, P3\_2, and P3\_6 in the P3 register are reserved bits. If it is necessary to set bits P3\_0, P3\_2 and P3\_6, set to 0. When read, the content is 0.
3. Bits P4\_0 to P4\_1 in the P4 register are unavailable on this MCU. If it is necessary to set bits P4\_0 to P4\_1 set to 0. When read, the content is 0. Bits P4\_3 and P4\_4 are reserved bits. If it is necessary to set bits P4\_3 and P4\_4, set to 0. When read, the content is 0.

Data input and output to and from external devices are accomplished by reading and writing to the Pi register. The Pi register consists of a port latch to retain output data and a circuit to read the pin status. The value written in the port latch is output from the pin. Each bit in the Pi register corresponds to one port.

#### Pi\_j Bit (i = 0 to 4, j = 0 to 7) (Port Pi\_j Bit)

The pin level of any I/O port which is set to input mode can be read by reading the corresponding bit in this register. The pin level of any I/O port which is set to output mode can be controlled by writing to the corresponding bit in this register.

### 7.4.3 Timer RA Pin Select Register (TRASR)

Address 0180h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	—	TRAIOSEL2	TRAIOSEL1	TRAIOSEL0
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	TRAIOSEL0	TRAIO pin select bit	b2 b1 b0 0 0 0: TRATIO pin not used 0 0 1: P1_7 assigned 0 1 0: P1_5 assigned 0 1 1: Do not set. 1 0 0: Do not set. 1 0 1: P3_5 assigned Other than above: Do not set.	R/W
b1	TRAIOSEL1			R/W
b2	TRAIOSEL2			R/W
b3	—	Reserved bits	Set to 0.	R/W
b4	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b5	—			
b6	—			
b7	—			

The TRASR register selects which pin is assigned to the timer RA I/O. To use the I/O pin for timer RA, set this register.

Set the TRASR register before setting the timer RA associated registers. Also, do not change the setting value in this register during timer RA operation.

### 7.4.4 Timer RB/RC Pin Select Register (TRBRCR)

Address 0181h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	TRCCLKSEL1	TRCCLKSEL0	—	—	TRBOSEL1	TRBOSEL0
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	TRBOSEL0	TRBO pin select bit	b1 b0 0 0: P1_3 assigned 0 1: P3_1 assigned 1 0: Do not set. 1 1: P3_3 assigned	R/W
b1	TRBOSEL1			R/W
b2	—	Reserved bit	Set to 0.	R/W
b3	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b4	TRCCLKSEL0	TRCCLK pin select bit	b5 b4 0 0: TRCCLK pin not used 0 1: P1_4 assigned 1 0: P3_3 assigned 1 1: P3_7 assigned	R/W
b5	TRCCLKSEL1			R/W
b6	—	Reserved bit	Set to 0.	R/W
b7	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—

The TRBRCR register selects which pin is assigned to the timer RB and timer RC I/O. To use the I/O pin for timer RB and timer RC, set this register.

Set bits TRBOSEL0 and TRBOSEL1 before setting the timer RB associated registers. Set bits TRCCLKSEL0 and TRCCLKSEL1 before setting the timer RC associated registers. Also, do not change the setting values of bits TRBOSEL0 and TRBOSEL1 during timer RB operation. Do not change the setting values of bits TRCCLKSEL0 and TRCCLKSEL1 during timer RC operation.

### 7.4.5 Timer RC Pin Select Register 0 (TRCPSR0)

Address 0182h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	TRCIOBSEL2	TRCIOBSEL1	TRCIOBSEL0	—	TRCIOASEL2	TRCIOASEL1	TRCIOASEL0
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	TRCIOASEL0	TRCIOA/TRCTRG pin select bit	b2 b1 b0 0 0 0: TRCIOA/TRCTRG pin not used	R/W
b1	TRCIOASEL1		0 0 1: P1_1 assigned	R/W
b2	TRCIOASEL2		0 1 0: P0_0 assigned	R/W
			0 1 1: P0_1 assigned	
		1 0 0: P0_2 assigned		
		1 0 1: Do not set.		
		1 1 0: P3_1 assigned		
		1 1 1: Do not set.		
b3	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b4	TRCIOBSEL0	TRCIOB pin select bit	b6 b5 b4 0 0 0: TRCIOB pin not used	R/W
b5	TRCIOBSEL1		0 0 1: P1_2 assigned	R/W
b6	TRCIOBSEL2		0 1 0: P0_3 assigned	R/W
			0 1 1: P0_4 assigned	
		1 0 0: P0_5 assigned		
		1 0 1: P2_0 assigned		
		Other than above: Do not set.		
b7	—	Reserved bit	Set to 0.	R/W

The TRCPSR0 register selects which pin is assigned to the timer RC I/O. To use the I/O pin for timer RC, set this register.

Set the TRCPSR0 register before setting the timer RC associated registers. Also, do not change the setting value in this register during timer RC operation.

### 7.4.6 Timer RC Pin Select Register 1 (TRCPSR1)

Address 0183h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	TRCIODSEL2	TRCIODSEL1	TRCIODSEL0	—	TRCIOCEL2	TRCIOCEL1	TRCIOCEL0
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	TRCIOSEL0	TRCIO pin select bit	b2 b1 b0 0 0 0: TRCIO pin not used 0 0 1: P1_3 assigned 0 1 0: P3_4 assigned 0 1 1: P0_7 assigned 1 0 0: P2_1 assigned Other than above: Do not set.	R/W
b1	TRCIOSEL1			R/W
b2	TRCIOSEL2			R/W
b3	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b4	TRCIODSEL0	TRCIOD pin select bit	b6 b5 b4 0 0 0: TRCIOD pin not used 0 0 1: P1_0 assigned 0 1 0: P3_5 assigned 0 1 1: P0_6 assigned 1 0 0: P2_2 assigned Other than above: Do not set.	R/W
b5	TRCIODSEL1			R/W
b6	TRCIODSEL2			R/W
b7	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—

The TRCPSR1 register selects which pin is assigned to the timer RC I/O. To use the I/O pin for timer RC, set this register.

Set the TRCPSR1 register before setting the timer RC associated registers. Also, do not change the setting value in this register during timer RC operation.

### 7.4.7 UART0 Pin Select Register (U0SR)

Address 0188h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	CLK0SEL0	—	RXD0SEL0	—	TXD0SEL0
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	TXD0SEL0	TXD0 pin select bit	0: TXD0 pin not used 1: P1_4 assigned	R/W
b1	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b2	RXD0SEL0	RXD0 pin select bit	0: RXD0 pin not used 1: P1_5 assigned	R/W
b3	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b4	CLK0SEL0	CLK0 pin select bit	0: CLK0 pin not used 1: P1_6 assigned	R/W
b5	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b6	—			
b7	—			

The U0SR register selects which pin is assigned to the UART0 I/O. To use the I/O pin for UART0, set this register.

Set the U0SR register before setting the UART0 associated registers. Also, do not change the setting value in this register during UART0 operation.

### 7.4.8 UART1 Pin Select Register (U1SR)

Address 0189h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	CLK1SEL0	—	RXD1SEL0	—	TXD1SEL0
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	TXD1SEL0	TXD1 pin select bit	0: TXD1 pin not used 1: P0_1 assigned	R/W
b1	—	Reserved bit	Set to 0.	R/W
b2	RXD1SEL0	RXD1 pin select bit	0: RXD1 pin not used 1: P0_2 assigned	R/W
b3	—	Reserved bit	Set to 0.	R/W
b4	CLK1SEL0	CLK1 pin select bit	0: CLK1 pin not used 1: P0_3 assigned	R/W
b5	—	Reserved bit	Set to 0.	R/W
b6	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b7	—			

The U1SR register selects which pin is assigned to the UART1 I/O. To use the I/O pin for UART1, set this register.

Set the U1SR register before setting the UART1 associated registers. Also, do not change the setting value in this register during UART1 operation.

### 7.4.9 UART2 Pin Select Register 0 (U2SR0)

Address 018Ah

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	RXD2SEL2	RXD2SEL1	RXD2SEL0	—	TXD2SEL2	TXD2SEL1	TXD2SEL0
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	TXD2SEL0	TXD2/SDA2 pin select bit	b2 b1 b0 0 0 0: TXD2/SDA2 pin not used 0 0 1: P3_7 assigned 0 1 0: P3_4 assigned 0 1 1: P0_0 assigned 1 0 0: P2_0 assigned 1 0 1: Do not set. 1 1 0: Do not set. 1 1 1: P2_2 assigned	R/W
b1	TXD2SEL1			R/W
b2	TXD2SEL2			R/W
b3	—	Reserved bit	Set to 0.	R/W
b4	RXD2SEL0	RXD2/SCL2 pin select bit	b6 b5 b4 0 0 0: RXD2/SCL2 pin not used 0 0 1: P3_4 assigned 0 1 0: P3_7 assigned 0 1 1: P4_5 assigned 1 0 0: P2_0 assigned 1 0 1: Do not set. 1 1 0: Do not set. 1 1 1: P2_2 assigned	R/W
b5	RXD2SEL1			R/W
b6	RXD2SEL2			R/W
b7	—	Reserved bit	Set to 0.	R/W

The U2SR0 register selects which pin is assigned to the UART2 I/O. To use the I/O pin for UART2, set this register.

Set the U2SR0 register before setting the UART2 associated registers. Also, do not change the setting value in this register during UART2 operation.

### 7.4.10 UART2 Pin Select Register 1 (U2SR1)

Address 018Bh

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	CTS2SEL1	CTS2SEL0	—	CLK2SEL2	CLK2SEL1	CLK2SEL0
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	CLK2SEL0	CLK2 pin select bit	b2 b1 b0 0 0 0: CLK2 pin not used 0 0 1: P3_5 assigned 0 1 0: P0_5 assigned 0 1 1: Do not set. 1 0 0: P2_1 assigned Other than above: Do not set.	R/W
b1	CLK2SEL1			R/W
b2	CLK2SEL2			R/W
b3	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b4	CTS2SEL0	CTS2/RTS2 pin select bit	b5 b4 0 0: CTS2/RTS2 pin not used 0 1: P3_3 assigned 1 0: P3_1 assigned 1 1: Do not set.	R/W
b5	CTS2SEL1			R/W
b6	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b7	—			

The U2SR1 register selects which pin is assigned to the UART2 I/O. To use the I/O pin for UART2, set this register.

Set the U2SR1 register before setting the UART2 associated registers. Also, do not change the setting value in this register during UART2 operation.

### 7.4.11 INT Interrupt Input Pin Select Register (INTSR)

Address 018Eh

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	INT3SEL0	—	—	INT1SEL2	INT1SEL1	INT1SEL0	—
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b1	INT1SEL0	$\overline{\text{INT1}}$ pin select bit	b3 b2 b1 0 0 0: P1_7 assigned 0 0 1: P1_5 assigned 0 1 0: P2_0 assigned 0 1 1: Do not set. 1 0 0: Do not set. 1 0 1: P3_5 assigned Other than above: Do not set.	R/W
b2	INT1SEL1			R/W
b3	INT1SEL2			R/W
b4	—	Reserved bit	Set to 0.	R/W
b5	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b6	INT3SEL0	$\overline{\text{INT3}}$ pin select bit	0: P3_3 assigned 1: P3_7 assigned	R/W
b7	—	Reserved bit	Set to 0.	R/W

The INTSR register selects which pin is assigned to the  $\overline{\text{INT}}_i$  ( $i = 1$  or  $3$ ) input. To use  $\overline{\text{INT}}_i$ , set this register.

Set the INTSR register before setting the  $\overline{\text{INT}}_i$  associated registers. Also, do not change the setting values in this register during  $\overline{\text{INT}}_i$  operation.

### 7.4.12 I/O Function Pin Select Register (PINSR)

Address 018Fh

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	IOINSEL	—	—	—
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b1	—	Reserved bit	Set to 0.	R/W
b2	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b3	IOINSEL	I/O port input function select bit	0: The I/O port input function depends on the PDi (i = 0 to 4) register. When the PDi_j (j = 0 to 7) bit in the PDi register is set to 0 (input mode), the pin input level is read. When the PDi_j bit in the PDi register is set to 1 (output mode), the port latch is read. 1: The I/O port input function reads the pin input level regardless of the PDi register.	R/W
b4	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b5	—			
b6	—			
b7	—			

#### IOINSEL Bit (I/O port input function select bit)

The IOINSEL bit is used to select the pin level of an I/O port when the PDi\_j (j = 0 to 7) bit in the PDi (i = 0 to 4) register is set to 1 (output mode). When this bit is set to 1, the I/O port input function reads the pin input level regardless of the PDi register.

Table 7.4 lists I/O Port Values Read by Using IOINSEL Bit. The IOINSEL bit can be used to change the input function of all I/O ports except P4\_2.

**Table 7.4 I/O Port Values Read by Using IOINSEL Bit**

PDi_j bit in PDi register	0 (input mode)		1 (output mode)	
IOINSEL bit	0	1	0	1
I/O port values read	Pin input level		Port latch value	Pin input level

### 7.4.13 Low-Voltage Signal Mode Control Register (TSMR)

Address 0190h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	I3LVM	I2LVM	I1LVM	I0LVM	U2LVM	U1LVM	U0LVM	LVMPR
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	LVMPR	Low-voltage signal mode protect bit	0: Write disabled 1: Write enabled <sup>(1)</sup>	R/W
b1	U0LVM	UART0 low-voltage signal mode control bit <sup>(1)</sup>	0: Low-voltage signal mode disabled 1: Low-voltage signal mode enabled <sup>(2)</sup>	R/W
b2	U1LVM	UART1 low-voltage signal mode control bit <sup>(1)</sup>		R/W
b3	U2LVM	UART2 low-voltage signal mode control bit <sup>(1)</sup>		R/W
b4	I0LVM	$\overline{\text{INT0}}$ low-voltage signal mode control bit <sup>(1)</sup>	0: Low-voltage signal mode disabled 1: Low-voltage signal mode enabled	R/W
b5	I1LVM	$\overline{\text{INT1}}$ low-voltage signal mode control bit <sup>(1)</sup>		R/W
b6	I2LVM	$\overline{\text{INT2}}$ low-voltage signal mode control bit <sup>(1)</sup>		R/W
b7	I3LVM	$\overline{\text{INT3}}$ low-voltage signal mode control bit <sup>(1)</sup>		R/W

Notes:

1. When the LVMPR bit is set to 1 (write enabled), writing to bits UiLVM (i = 0 to 2) and IjLVM (j = 0 to 3) is enabled. Rewrite bits UiLVM (i = 0 to 2) and IjLVM (j = 0 to 3) after setting the LVMPR bit to 1. When writing 1 to the LVMPR bit, write 0 and then 1 continuously.
2. When the UiLVM (i = 0 to 2) bit is set to 1, the TxDi pin is set to N-channel open-drain output regardless of the setting of the NCH bit in the UiC0 (i = 0 to 2) register.

### 7.4.14 Pull-Up Control Register 0 (PUR0)

Address 01E0h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	PU07	PU06	—	PU04	PU03	PU02	PU01	PU00
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	PU00	P0_0 to P0_3 pull-up	0: Not pulled up 1: Pulled up <sup>(1)</sup>	R/W
b1	PU01	P0_4 to P0_7 pull-up		R/W
b2	PU02	P1_0 to P1_3 pull-up		R/W
b3	PU03	P1_4 to P1_7 pull-up		R/W
b4	PU04	P2_0 to P2_2 pull-up		R/W
b5	—	Reserved bit	Set to 0.	R/W
b6	PU06	P3_1, P3_3 pull-up	0: Not pulled up 1: Pulled up <sup>(1)</sup>	R/W
b7	PU07	P3_4, P3_5, P3_7 pull-up		R/W

Note:

1. When this bit is set to 1 (pulled up), the pin whose port direction bit is set to 0 (input mode) is pulled up.

For pins used as input, the setting values in the PUR0 register are valid.

### 7.4.15 Pull-Up Control Register 1 (PUR1)

Address 01E1h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	—	—	PU11	—
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	—	Nothing is assigned. If necessary, set to 0. When read, the content is undefined.		—
b1	PU11	P4_5 to P4_7 pull-up	0: Not pulled up 1: Pulled up <sup>(1)</sup>	R/W
b2	—	Nothing is assigned. If necessary, set to 0. When read, the content is undefined.		—
b3	—			
b4	—			
b5	—			
b6	—			
b7	—			

Note:

1. When this bit is set to 1 (pulled up), the pin whose port direction bit is set to 0 (input mode) is pulled up.

For pins used as input, the setting values in the PUR1 register are valid.

### 7.4.16 Port P1 Drive Capacity Control Register (P1DDR)

Address 01F0h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	P1DDR7	P1DDR6	P1DDR5	P1DDR4	P1DDR3	P1DDR2	P1DDR1	P1DDR0
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	P1DDR0	P1_0 drive capacity	0: Low 1: High <sup>(1)</sup>	R/W
b1	P1DDR1	P1_1 drive capacity		R/W
b2	P1DDR2	P1_2 drive capacity		R/W
b3	P1DDR3	P1_3 drive capacity		R/W
b4	P1DDR4	P1_4 drive capacity		R/W
b5	P1DDR5	P1_5 drive capacity		R/W
b6	P1DDR6	P1_6 drive capacity		R/W
b7	P1DDR7	P1_7 drive capacity		R/W

Note:

- Both "H" and "L" output are set to high drive capacity.

The P1DDR register selects whether the drive capacity of the P1 output transistor is set to low or high.

The P1DDRRi bit (i = 0 to 7) is used to select whether the drive capacity of the output transistor is set to low or high for each pin.

For pins used as output, the setting values in the P1DDR register are valid.

### 7.4.17 Port P2 Drive Capacity Control Register (P2DDR)

Address 01F1h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	—	P2DDR2	P2DDR1	P2DDR0
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	P2DRR0	P2_0 drive capacity	0: Low 1: High <sup>(1)</sup>	R/W
b1	P2DRR1	P2_1 drive capacity		R/W
b2	P2DRR2	P2_2 drive capacity		R/W
b3	—	Reserved bits	Set to 0.	R/W
b4	—			
b5	—			
b6	—			
b7	—	Nothing is assigned. If necessary, set to 0. When read, the content is undefined.		—

Note:

- Both "H" and "L" output are set to high drive capacity.

The P2DDR register selects whether the drive capacity of the P2\_0 to P2\_2 output transistor is set to low or high. The P2DDRRi bit (i = 0 to 2) is used to select whether the drive capacity of the output transistor is set to low or high for each pin.

For pins used as output, the setting values in the P2DDR register are valid.

### 7.4.18 Drive Capacity Control Register 0 (DRR0)

Address 01F2h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	DRR07	DRR06	—	—	—	—	DRR01	DRR00
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	DRR00	P0_0 to P0_3 drive capacity	0: Low	R/W
b1	DRR01	P0_4 to P0_7 drive capacity	1: High <sup>(1)</sup>	R/W
b2	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b3	—			
b4	—			
b5	—			
b6	DRR06	P3_1, P3_3 drive capacity	0: Low	R/W
b7	DRR07	P3_4, P3_5, P3_7 drive capacity	1: High <sup>(1)</sup>	R/W

Note:

- Both “H” and “L” output are set to high drive capacity.

For pins used as output, the setting values in the DRR0 register are valid.

#### DRR00 Bit (P0\_0 to P0\_3 drive capacity)

The DRR00 bit selects whether the drive capacity of the P0\_0 to P0\_3 output transistors is set to low or high. This bit is used to select whether the drive capacity of the output transistors is set to low or high for four pins.

#### DRR01 Bit (P0\_4 to P0\_7 drive capacity)

The DRR01 bit selects whether the drive capacity of the P0\_4 to P0\_7 output transistors is set to low or high. This bit is used to select whether the drive capacity of the output transistors is set to low or high for four pins.

#### DRR06 Bit (P3\_1, P3\_3 drive capacity)

The DRR06 bit selects whether the drive capacity of the P3\_1, P3\_3 output transistors is set to low or high. This bit is used to select whether the drive capacity of the output transistors is set to low or high for two pins.

#### DRR07 Bit (P3\_4, P3\_5, P3\_7 drive capacity)

The DRR07 bit selects whether the drive capacity of the P3\_4, P3\_5, P3\_7 output transistors is set to low or high. This bit is used to select whether the drive capacity of the output transistors is set to low or high for three pins.

### 7.4.19 Drive Capacity Control Register 1 (DRR1)

Address 01F3h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	—	—	DRR11	—
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	—	Nothing is assigned. If necessary, set to 0. When read, the content is undefined.		—
b1	DRR11	P4_5 to P4_7 drive capacity	0: Low 1: High <sup>(1)</sup>	R/W
b2	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b3	—	Reserved bits	Set to 0.	R/W
b4	—			
b5	—			
b6	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b7	—			

Note:

- Both “H” and “L” output are set to high drive capacity.

For pins used as output, the setting values in the DRR1 register are valid.

#### DRR11 Bit (P4\_5 to P4\_7 drive capacity)

The DRR11 bit selects whether the drive capacity of the P4\_5 to P4\_7 output transistors is set to low or high. This bit is used to select whether the drive capacity of the output transistors is set to low or high for three pins.

### 7.4.20 Input Threshold Control Register 0 (VLT0)

Address 01F5h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	VLT07	VLT06	VLT05	VLT04	VLT03	VLT02	VLT01	VLT00
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	VLT00	P0 input level select bit	b1 b0 0 0: $0.50 \times VCC$ 0 1: $0.35 \times VCC$ 1 0: $0.70 \times VCC$ 1 1: Do not set.	R/W
b1	VLT01			R/W
b2	VLT02	P1 input level select bit	b3 b2 0 0: $0.50 \times VCC$ 0 1: $0.35 \times VCC$ 1 0: $0.70 \times VCC$ 1 1: Do not set.	R/W
b3	VLT03			R/W
b4	VLT04	P2_0 to P2_2 input level select bit	b5 b4 0 0: $0.50 \times VCC$ 0 1: $0.35 \times VCC$ 1 0: $0.70 \times VCC$ 1 1: Do not set.	R/W
b5	VLT05			R/W
b6	VLT06	P3_1, P3_3 to P3_5, P3_7 input level select bit	b7 b6 0 0: $0.50 \times VCC$ 0 1: $0.35 \times VCC$ 1 0: $0.70 \times VCC$ 1 1: Do not set.	R/W
b7	VLT07			R/W

The VLT0 register selects the voltage level of the input threshold values for ports P0, P1, P2\_0 to P2\_2, P3\_1, P3\_3 to P3\_5, P3\_7. Bits VLT00 to VLT07 are used to select the input threshold values among three voltage levels (0.35 VCC, 0.50 VCC, and 0.70 VCC).

### 7.4.21 Input Threshold Control Register 1 (VLT1)

Address 01F6h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	—	—	VLT11	VLT10
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	VLT10	P4_2, P4_5 to P4_7 input level select bit	b1 b0 0 0: $0.50 \times VCC$ 0 1: $0.35 \times VCC$ 1 0: $0.70 \times VCC$ 1 1: Do not set.	R/W
b1	VLT11			R/W
b2	—	Nothing is assigned. If necessary, set to 0. When read, the content is undefined.		—
b3	—			
b4	—			
b5	—			
b6	—			
b7	—			

The VLT1 register selects the voltage level of the input threshold values for ports P4\_2 and P4\_5 to P4\_7. Bits VLT10 and VLT11 are used to select the input threshold values among three voltage levels (0.35 VCC, 0.50 VCC, and 0.70 VCC).

## 7.5 Port Settings

Tables 7.5 to 7.37 list the port settings.

**Table 7.5 Port P0\_0/AN7/CHxC/TXD2/SDA2/TRCIOA/TRCTR**

Register	PD0	ADINSEL					SCUCR0		TSMR	U2SR0			U2MR			U2SMR	TRCPSR0			Timer RC Setting	Function

	0	X	X	X	X	X	0	X	1	0	1	1	0	1	0	1	0	X	X	X	X	SDA2 CMOS input, N-channel open-drain output (6, 7)
	0	X	X	X	X	X	0	X	X	Other than 011b			X	X	X	X	0	1	0	Refer to Table 7.34 TRCIOA Pin Setting	TRCIOA input <sup>(1)</sup>	
	X	X	X	X	X	X	0	X	X	Other than 011b			X	X	X	X	0	1	0	Refer to Table 7.34 TRCIOA Pin Setting	TRCIOA output <sup>(2)</sup>	

X: 0 or 1

Notes:

1. Pulled up by setting the PU00 bit in the PUR0 register to 1.
2. Output drive capacity high by setting the DRR00 bit in the DRR0 register to 1.
3. N-channel open-drain output by setting the NCH bit in the U2C0 register to 1. However, when the U2LVM bit in the TSMR register is set to 1 (low-voltage signal mode enabled), the setting of the NCH bit is disabled. Refer to **7.6 Low-Voltage Signal Mode** for details.
4. After the sensor control unit operates, "H" is forcibly output from CHxC in Status 2.
5. After the sensor control unit operates, CHxC is set to input in Status 6 to 10 and 15 to 20.
6. SDA2 N-channel open-drain output is set.
7. Schmitt input is switched to CMOS input.

**Table 7.6 Port P0\_1/AN6/CHxB/TXD1/TRCIOA/TRCTRG**

X: 0 or 1

Notes:

1. Pulled up by setting the PU04 bit in the PUR0 register to 1.
2. Output drive capacity high by setting the P2DRR0 bit in the P2DRR register to 1.
3. N-channel open-drain output by setting the NCH bit in the U2C0 register to 1. However, when the U2LVM bit in the TSMR register is set to 1 (low-voltage signal mode enabled), the setting of the NCH bit is disabled. Refer to **7.6 Low-Voltage Signal Mode** for details.
4. Schmitt input is switched to CMOS input.
5. SDA2/SCL2 N-channel open-drain output is set.

Setting Value	0	0	X	X	X	X	X	X	X	0	X	Other than 011b			X	X	X	X	X	X	Input port (1)	
	1	0	X	X	X	X	X	X	X	X	X	Other than 011b			X	X	X	X	X	X	Output port (2)	
	X	1	1	0	1	1	0	1	X	X	X	Other than 011b			X	X	X	X	X	X	CH13 input	
	X	1	1	Other than 01101b					X	X	X	X	X	X	X	X	X	X	X	CH13 forced "H" output (2)		
	0	0	X	X	X	X	X	X	X	0	1	Other than 011b			X	X	X	X	X	X	INT0 input (1)	
	0	0	X	X	X	X	X	X	X	1	1	Other than 011b			X	X	X	X	X	X	INT0 CMOS input (1, 4)	
	0	0	X	X	X	X	X	X	0	0	X	0	1	1	X	X	X	X	X	X	RXD2 input (1)	
	0	0	X	X	X	X	X	X	1	0	X	0	1	1	X	X	X	X	X	X	RXD2 CMOS input (1, 4)	
	0	0	X	X	X	X	X	X	0	0	X	0	1	1	0	1	0	1	X	X	SCL2 input/output (2, 3)	
	0	0	X	X	X	X	X	X	1	0	X	0	1	1	0	1	0	1	X	X	SCL2 CMOS input, N-channel open-drain output (4, 5)	
	0	0	X	X	X	X	X	X	X	0	1	Other than 011b			X	X	X	X	1	1	ADTRG input (1)	

X: 0 or 1

Notes:

1. Pulled up by setting the PU11 bit in the PUR1 register to 1.
2. Output drive capacity high by setting the DRR11 bit in the DRR1 register to 1.
3. N-channel open-drain output by setting the NCH bit in the U2C0 register to 1. However, when the U2LVM bit in the TSMR register is set to 1 (low-voltage signal mode enabled), the setting of the NCH bit is disabled. Refer to **7.6 Low-Voltage Signal Mode** for details.
4. Schmitt input is switched to CMOS input.
5. SCL2 N-channel open-drain output is set.

**Table 7.31 Port P4\_6/XIN**

Register	PD4	CM0	CM1			Circuit specifications		Function

## 7.6 Low-Voltage Signal Mode

Serial interface (UART0 to UART2) communication and the  $\overline{\text{INT}}$  input for the  $\overline{\text{INT}}$  interrupt can be performed using a low-voltage signal. Table 7.38 lists the Pins Usable for Inputting and Outputting Low-Voltage Signal.

Depending on the setting of the TSMR register, the pins enabled for low-voltage signal mode is switched from schmitt input to CMOS input when they are used as input.

Set the input threshold values for CMOS input using registers VLT0 and VLT1.

When low-voltage signal mode is used, all inputs are set to CMOS input. Since schmitt input is disabled, always take countermeasures against noise.

**Table 7.38 Pins Usable for Inputting and Outputting Low-Voltage Signal**

Peripheral Function Name		Pin
Serial interface	UART0 Clock synchronous serial I/O Clock asynchronous serial I/O	CLK0, RXD0, TXD0
	UART1 Clock synchronous serial I/O Clock asynchronous serial I/O	CLK1, RXD1, TXD1
	UART2 Clock synchronous serial I/O Clock asynchronous serial I/O Special mode 1 (I <sup>2</sup> C mode) Special mode 2 (SSU mode) Multiprocessor communication function	CLK2, RXD2, TXD2, CTS2, RTS2, SCL2, SDA2
$\overline{\text{INT}}$	$\overline{\text{INT0}}$ to $\overline{\text{INT3}}$	$\overline{\text{INT0}}$ to $\overline{\text{INT3}}$

## 7.7 Unassigned Pin Handling

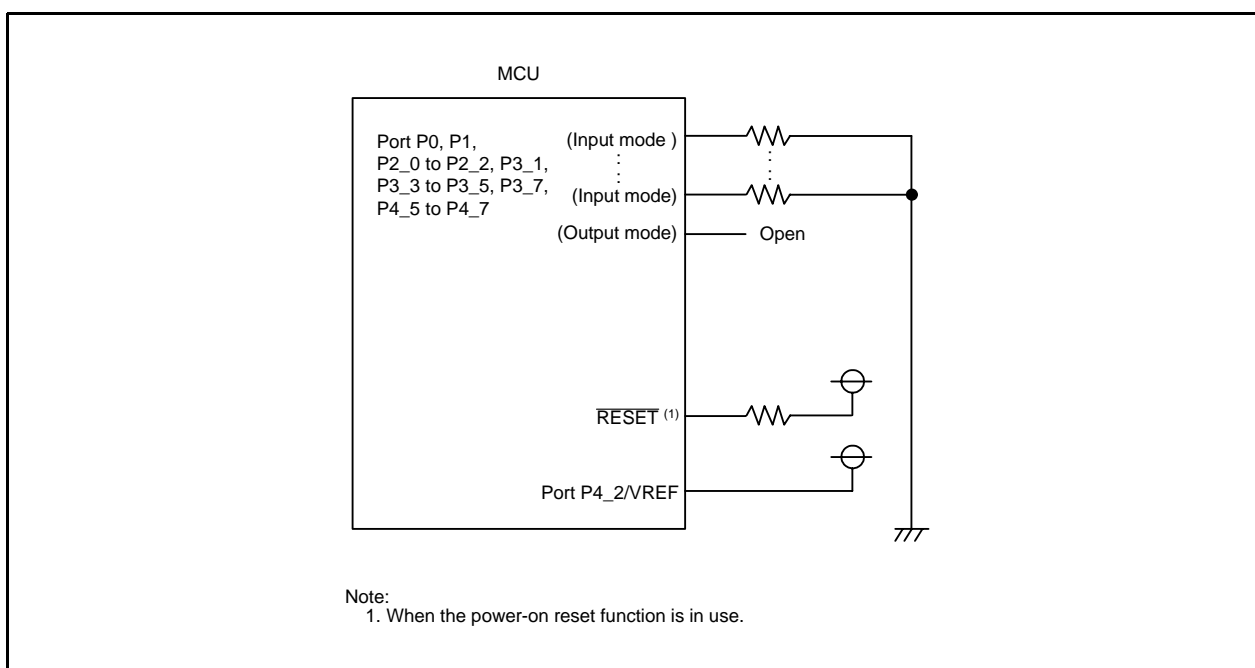

Table 7.39 lists Unassigned Pin Handling. Figure 7.12 shows the Unassigned Pin Handling.

**Table 7.39 Unassigned Pin Handling**

Pin Name	Connection
Ports P0, P1, P2_0 to P2_2, P3_1, P3_3 to P3_5, P3_7, P4_5 to P4_7	<ul style="list-style-type: none"> <li>• After setting to input mode, connect each pin to VSS via a resistor (pull-down) or connect each pin to VCC via a resistor (pull-up). <sup>(2)</sup></li> <li>• After setting to output mode, leave these pins open. <sup>(1, 2)</sup></li> </ul>
Port P4_2/VREF	Connect to VCC
RESET <sup>(3)</sup>	Connect to VCC via a pull-up resistor <sup>(2)</sup>

Notes:

1. If these ports are set to output mode and left open, they remain in input mode until they are switched to output mode by a program. The voltage level of these pins may be undefined and the power current may increase while the ports remain in input mode. The content of the direction registers may change due to noise or program runaway caused by noise. In order to enhance program reliability, the program should periodically repeat the setting of the direction registers.
2. Connect these unassigned pins to the MCU using the shortest wire length (2 cm or less) possible.
3. When the power-on reset function is in use.

**Figure 7.12 Unassigned Pin Handling**

## 8. Bus

The bus cycles differ when accessing ROM, RAM, DTC vector area, DTC control data and when accessing SFR. Table 8.1 lists Bus Cycles by Access Area of R8C/33T Group.

ROM, RAM, DTC vector area, DTC control data and SFR are connected to the CPU by an 8-bit bus. When accessing in word (16-bit) units, these areas are accessed twice in 8-bit units.

Table 8.2 lists Access Units and Bus Operations.

**Table 8.1 Bus Cycles by Access Area of R8C/33T Group**

Access Area	Bus Cycle
SFR, Data flash	2 cycles of CPU clock
Program ROM, RAM	1 cycle of CPU clock

**Table 8.2 Access Units and Bus Operations**

Area	SFR, Data flash	ROM (program ROM), RAM, DTC vector area, DTC control data
Even address Byte access	CPU clock  Address  Data 	CPU clock  Address  Data 
Odd address Byte access	CPU clock  Address  Data 	CPU clock  Address  Data 
Even address Word access	CPU clock  Address  Data 	CPU clock  Address  Data 
Odd address Word access	CPU clock  Address  Data 	CPU clock  Address  Data 

However, only the following SFRs are connected with the 16-bit bus:

Interrupts: Each interrupt control register

Timer RC: Registers TRC, TRCGRA, TRCGRB, TRCGRC, and TRCGRD

UART2: Registers U2MR, U2BRG, U2TB, U2C0, U2C1, U2RB, U2SMR5, U2SMR4, U2SMR3, U2SMR2, and U2SMR

A/D converter: Registers AD0, AD1, AD2, AD3, AD4, AD5, AD6, AD7, ADMOD, ADINSEL, ADCON0, and ADCON1

Address match interrupt: Registers RMAD0, AIER0, RMAD1, and AIER1

Therefore, they are accessed once in 16-bit units. The bus operation is the same as “Area: SFR, Data flash, Even address Byte access” in Table 8.2 Access Units and Bus Operations, and 16-bit data is accessed at a time.

## 9. Clock Generation Circuit

The following four circuits are incorporated in the clock generation circuit:

- XIN clock oscillation circuit
- Low-speed on-chip oscillator
- High-speed on-chip oscillator
- Low-speed on-chip oscillator for watchdog timer

### 9.1 Overview

Table 9.1 lists the Specification Overview of Clock Generation Circuit. Figure 9.1 shows a Clock Generation Circuit. Figure 9.2 shows a Peripheral Function Clock and Figure 9.3 shows a Procedure for Reducing Internal Power Consumption Using VCA20 bit.

**Table 9.1 Specification Overview of Clock Generation Circuit**

Item	XIN Clock Oscillation Circuit	On-Chip Oscillator		Low-Speed On-Chip Oscillator for Watchdog Timer
		High-Speed On-Chip Oscillator	Low-Speed On-Chip Oscillator	
Applications	<ul style="list-style-type: none"> <li>• CPU clock source</li> <li>• Peripheral function clock source</li> </ul>	<ul style="list-style-type: none"> <li>• CPU clock source</li> <li>• Peripheral function clock source</li> <li>• CPU and peripheral function clock source when XIN clock stops oscillating</li> </ul>	<ul style="list-style-type: none"> <li>• CPU clock source</li> <li>• Peripheral function clock source</li> <li>• CPU and peripheral function clock source when XIN clock stops oscillating</li> </ul>	<ul style="list-style-type: none"> <li>• Watchdog timer clock source</li> </ul>
Clock frequency	0 to 20 MHz	Approx. 40 MHz <sup>(3)</sup>	Approx. 125 kHz	Approx. 125 kHz
Connectable oscillator	<ul style="list-style-type: none"> <li>• Ceramic resonator</li> <li>• Crystal oscillator</li> </ul>	—	—	—
Oscillator connect pins	XIN, XOUT <sup>(1)</sup>	— <sup>(1)</sup>	— <sup>(1)</sup>	—
Oscillation stop, restart function	Usable	Usable	Usable	Usable
Oscillator status after reset	Stop	Stop	Oscillate	Stop <sup>(4)</sup> Oscillate <sup>(5)</sup>
Others	Externally generated clock can be input <sup>(2)</sup>	—	—	—

Notes:

1. These pins can be used as P4\_6 or P4\_7 when using the on-chip oscillator clock as the CPU clock while the XIN clock oscillation circuit is not used.
2. To input an external clock, set the CM05 bit in the CM0 register to 1 (XIN clock stops), the CM11 bit in the CM1 register to 1 (internal feedback resistor disabled), and the CM13 bit to 1 (XIN-XOUT pin).
3. The clock frequency is automatically set to up to 20 MHz by a divider when using the high-speed on-chip oscillator as the CPU clock source.
4. This applies when the CSPROINI bit in the OFS register is set to 1 (count source protection mode disabled after reset).
5. This applies when the CSPROINI bit in the OFS register is set to 0 (count source protection mode enabled after reset).

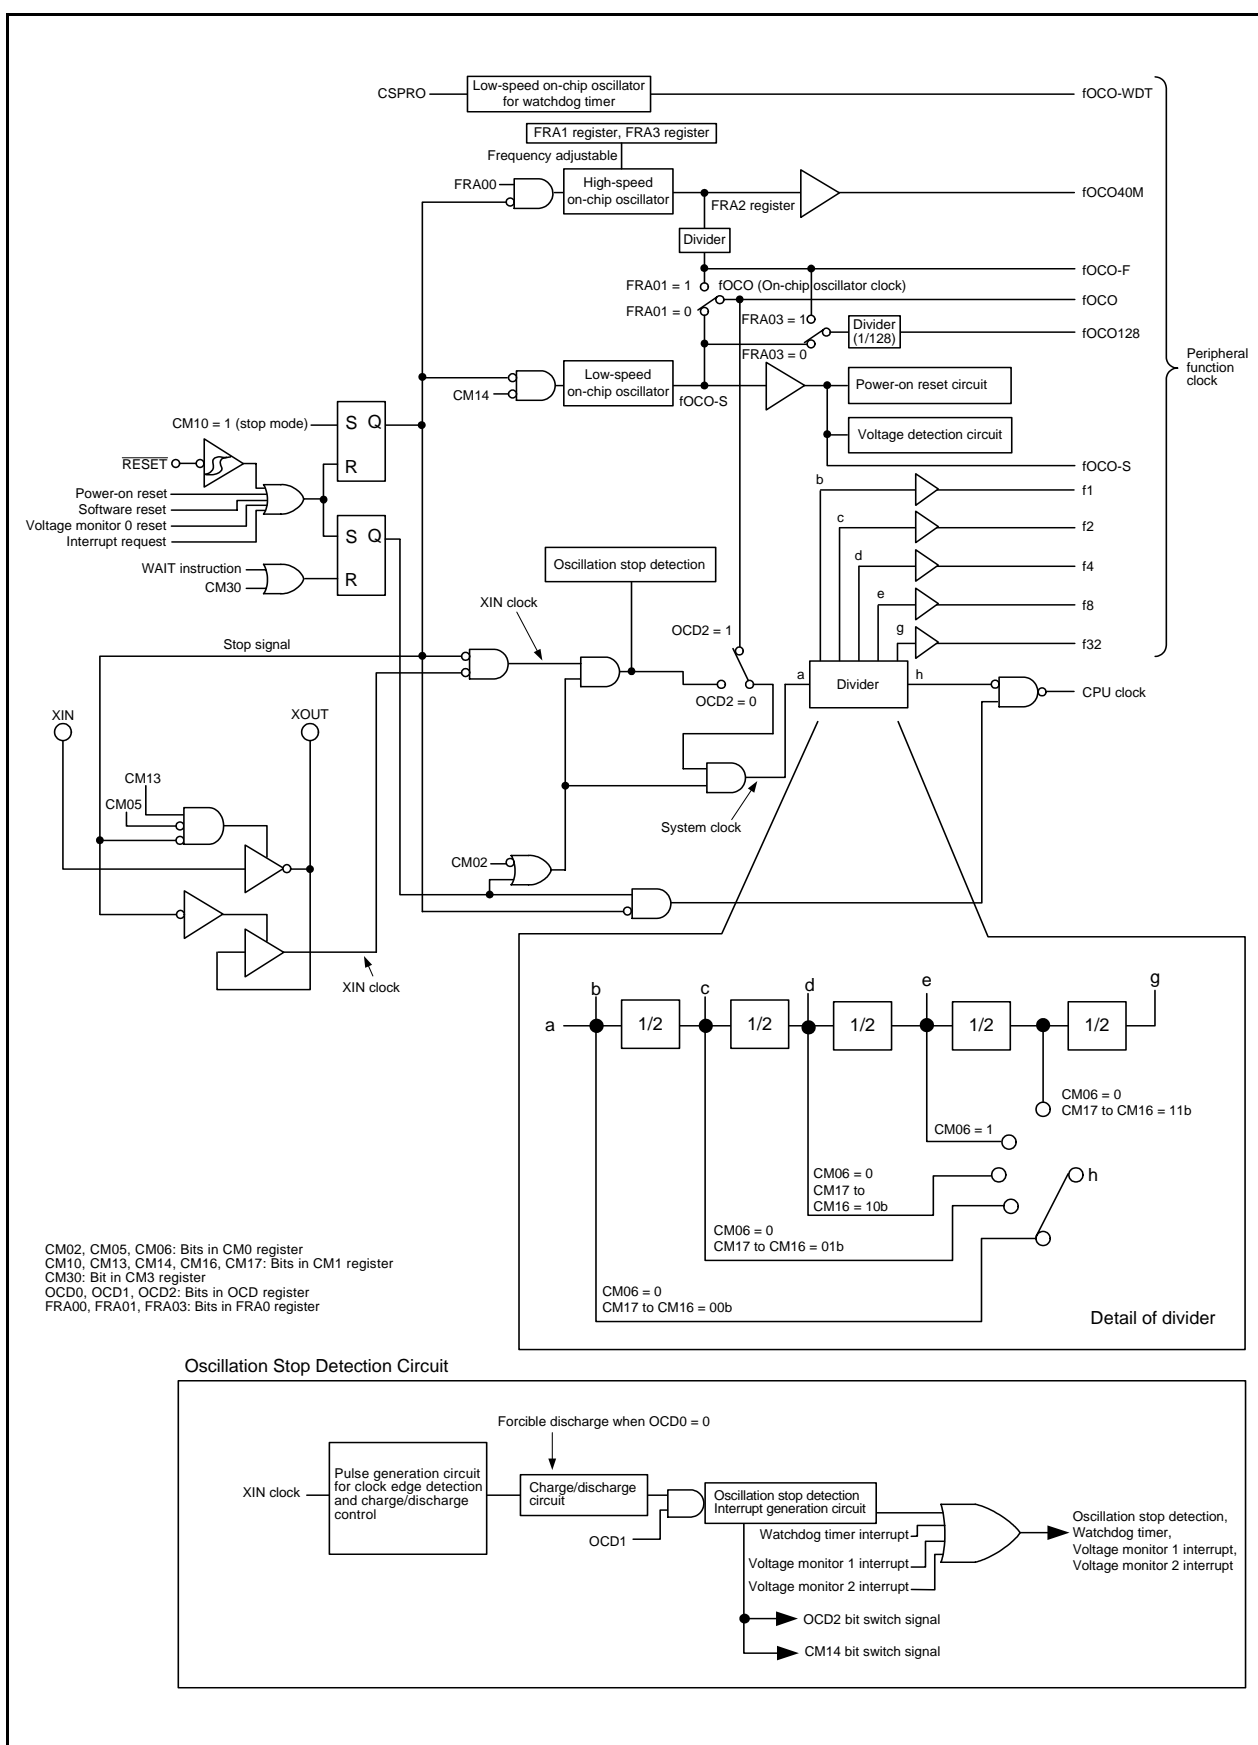

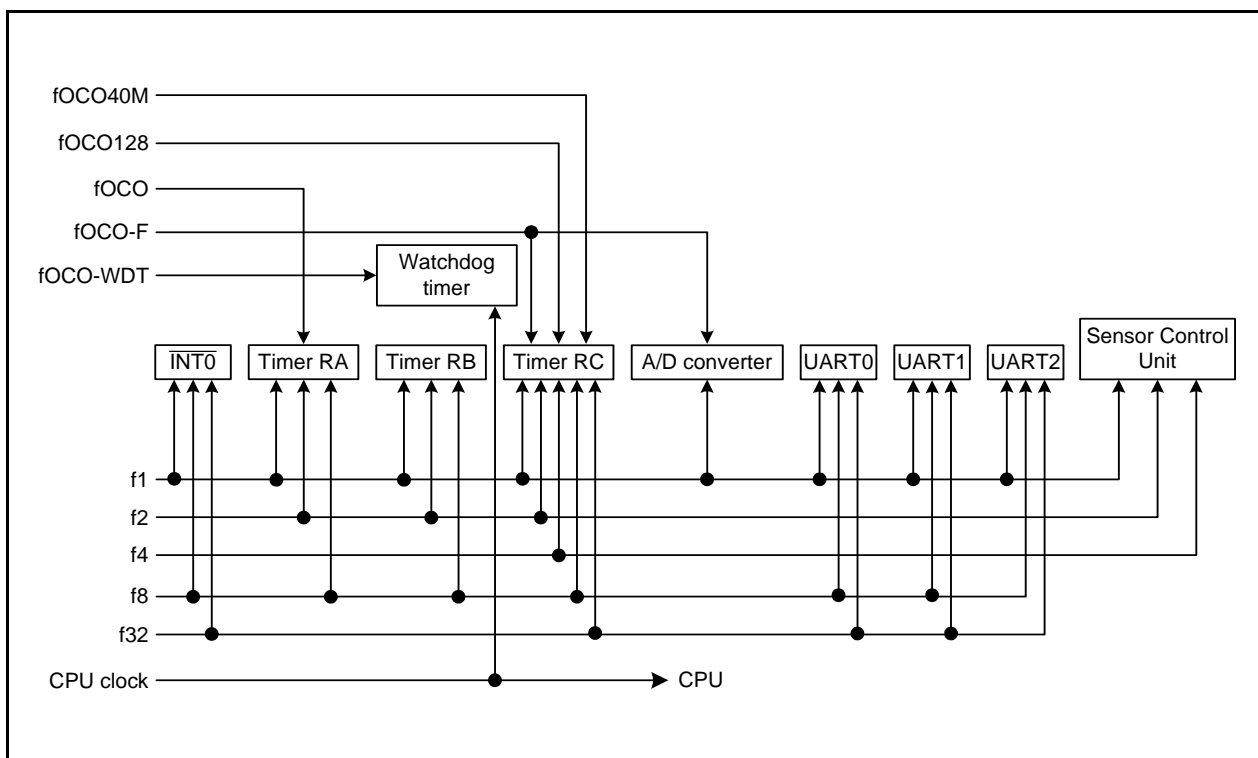

Figure 9.1 Clock Generation Circuit

**Figure 9.2** Peripheral Function Clock

## 9.2 Registers

### 9.2.1 System Clock Control Register 0 (CM0)

Address 0006h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	CM06	CM05	—	—	CM02	—	—
After Reset	0	0	1	0	1	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	—	Reserved bits	Set to 0.	R/W
b1	—			
b2	CM02	Wait mode peripheral function clock stop bit	0: Peripheral function clock does not stop in wait mode 1: Peripheral function clock stops in wait mode	R/W
b3	—	Reserved bits	Set to 0.	R/W
b4	—			
b5	CM05	XIN clock (XIN-XOUT) stop bit (1, 3)	0: XIN clock oscillates 1: XIN clock stops (2)	R/W
b6	CM06	CPU clock division select bit 0 (4)	0: Bits CM16 and CM17 in CM1 register enabled 1: Divide-by-8 mode	R/W
b7	—	Reserved bit	Set to 0.	R/W

Notes:

- The CM05 bit stops the XIN clock when the high-speed on-chip oscillator mode or low-speed on-chip oscillator mode is selected. This bit cannot be used to detect whether the XIN clock has stopped. To stop the XIN clock, set the bits in the following order:  
(1) Set bits OCD1 to OCD0 in the OCD register to 00b.  
(2) Set the OCD2 bit to 1 (on-chip oscillator clock selected).
- During external clock input, only the clock oscillation buffer stops and clock input is acknowledged.
- Only when the CM05 bit is set to 1 (XIN clock stops) and the CM13 bit in the CM1 register is set to 0 (P4\_6 and P4\_7), P4\_6 and P4\_7 can be used as I/O ports.
- When the MCU enters stop mode, the CM06 bit is set to 1 (divide-by-8 mode).

Set the PRC0 bit in the PRCR register to 1 (write enabled) before rewriting the CM0 register.

### 9.2.2 System Clock Control Register 1 (CM1)

Address 0007h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	CM17	CM16	—	CM14	CM13	—	CM11	CM10
After Reset	0	0	1	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	CM10	All clock stop control bit <sup>(2, 6)</sup>	0: Clock oscillates 1: All clocks stop (stop mode)	R/W
b1	CM11	XIN-XOUT on-chip feedback resistor select bit	0: On-chip feedback resistor enabled 1: On-chip feedback resistor disabled	R/W
b2	—	Reserved bit	Set to 0.	R/W
b3	CM13	Port/XIN-XOUT switch bit <sup>(5)</sup>	0: I/O ports P4_6 and P4_7 1: XIN-XOUT pin	R/W
b4	CM14	Low-speed on-chip oscillator stop bit <sup>(3, 4)</sup>	0: Low-speed on-chip oscillator on 1: Low-speed on-chip oscillator off	R/W
b5	—	Reserved bit	Set to 1.	R/W
b6	CM16	CPU clock division select bit <sup>(1)</sup>	b7 b6 0 0: No division mode 0 1: Divide-by-2 mode 1 0: Divide-by-4 mode 1 1: Divide-by-16 mode	R/W
b7	CM17			R/W

Notes:

- When the CM06 bit is set to 0 (bits CM16 and CM17 enabled), bits CM16 and CM17 are enabled.
- If the CM10 bit is set to 1 (stop mode), the on-chip feedback resistor is disabled.
- When the OCD2 bit is set to 0 (XIN clock selected), the CM14 bit can be set to 1 (low-speed on-chip oscillator off). When the OCD2 bit is set to 1 (on-chip oscillator clock selected), the CM14 bit is set to 0 (low-speed on-chip oscillator on). It remains unchanged even if 1 is written to it.
- To use the voltage monitor 1 interrupt or voltage monitor 2 interrupt (when the digital filter is used), set the CM14 bit to 0 (low-speed on-chip oscillator on).
- Once the CM13 bit is set to 1 by a program, it cannot be set to 0.
- Do not set the CM10 bit to 1 (stop mode) when the VCA20 bit in the VCA2 register to 1 (low consumption enabled).

Set the PRC0 bit in the PRCR register to 1 (write enabled) before rewriting the CM1 register.

### 9.2.3 System Clock Control Register 3 (CM3)

Address 0009h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	CM37	CM36	CM35	—	—	—	—	CM30
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	CM30	Wait control bit <sup>(1)</sup>	0: Other than wait mode 1: MCU enters wait mode	R/W
b1	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b2	—			
b3	—	Reserved bits	Set to 0.	R/W
b4	—			
b5	CM35	CPU clock division when exiting wait mode select bit <sup>(2)</sup>	0: Following settings are enabled: CM06 bit in CM0 register Bits CM16 and CM17 in CM1 register 1: No division	R/W
b6	CM36	System clock when exiting wait mode or stop mode select bit	<sup>b7 b6</sup> 0 0: MCU exits with the CPU clock immediately before entering wait or stop mode. 0 1: Do not set. 1 0: High-speed on-chip oscillator clock selected <sup>(3)</sup> 1 1: XIN clock selected <sup>(4)</sup>	R/W
b7	CM37			R/W

Notes:

- When the MCU exits wait mode by a peripheral function interrupt, the CM30 bit is set to 0 (other than wait mode).
- Set the CM35 bit to 0 in stop mode. When the MCU enters wait mode, if the CM35 bit is set to 1 (no division), the CM06 bit in the CM0 register is set to 0 (bits CM16 and CM17 enabled) and bits CM17 and CM16 in the CM1 register is set to 00b (no division mode).
- When bits CM37 and CM36 are set to 10b (high-speed on-chip oscillator clock selected), the following will be set when the MCU exits wait mode or stop mode.
  - OCD2 bit in OCD register = 1 (on-chip oscillator selected)
  - FRA00 bit in FRA0 register = 1 (high-speed on-chip oscillator on)
  - FRA01 bit in FRA0 register = 1 (high-speed on-chip oscillator selected)
- When bits CM37 and CM36 are set to 11b (XIN clock selected), the following will be set when the MCU exits wait mode or stop mode.
  - OM05 bit in OM0 register = 1 (XIN clock oscillates)
  - OM13 bit in OM1 register = 1 (XIN-XOUT pin)
  - OCD2 bit in OCD register = 0 (XIN clock selected)

When the MCU enters wait mode while the CM05 bit in the CM0 register is 1 (XIN clock stops), if the XIN clock is selected as the CPU clock when exiting wait mode, set the CM06 bit to 1 (divide-by-8 mode) and the CM35 bit to 0.

However, if an externally generated clock is used as the XIN clock, do not set bits CM37 to CM36 to 11b (XIN clock selected).

Set the PRC0 bit in the PRCR register to 1 (write enabled) before rewriting the CM3 register.

#### CM30 bit (Wait Control Bit)

When the CM30 bit is set to 1 (MCU enters wait mode), the CPU clock stops (wait mode). Since the XIN clock and the on-chip oscillator clock do not stop, the peripheral functions using these clocks continue operating. To set the CM30 bit to 1, set the I flag to 0 (maskable interrupt disabled).

The MCU exits wait mode by a reset or peripheral function interrupt. When the MCU exits wait mode by a peripheral function interrupt, it resumes executing the instruction immediately after the instruction to set the CM30 bit to 1.

When the MCU enters wait mode with the WAIT instruction, make sure to set the I flag to 1 (maskable interrupt enabled). With this setting, interrupt handling is performed by the CPU when the MCU exits wait mode.

### 9.2.4 Oscillation Stop Detection Register (OCD)

Address 000Ch

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	OCD3	OCD2	OCD1	OCD0
After Reset	0	0	0	0	0	1	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	OCD0	Oscillation stop detection enable bit <sup>(6)</sup>	0: Oscillation stop detection function disabled <sup>(1)</sup> 1: Oscillation stop detection function enabled	R/W
b1	OCD1	Oscillation stop detection interrupt enable bit	0: Disabled <sup>(1)</sup> 1: Enabled	R/W
b2	OCD2	System clock select bit <sup>(3)</sup>	0: XIN clock selected <sup>(6)</sup> 1: On-chip oscillator clock selected <sup>(2)</sup>	R/W
b3	OCD3	Clock monitor bit <sup>(4, 5)</sup>	0: XIN clock oscillates 1: XIN clock stops	R
b4	—	Reserved bits	Set to 0.	R/W
b5	—			
b6	—			
b7	—			

Notes:

- Set bits OCD1 to OCD0 to 00b before the MCU enters stop mode, high-speed on-chip oscillator mode, or low-speed on-chip oscillator mode (XIN clock stops).
- If the OCD2 bit is set to 1 (on-chip oscillator clock selected), the CM14 bit is set to 0 (low-speed on-chip oscillator on).
- The OCD2 bit is automatically set to 1 (on-chip oscillator clock selected) if XIN clock oscillation stop is detected while bits OCD1 to OCD0 are set to 11b. If the OCD3 bit is set to 1 (XIN clock stops), the OCD2 bit remains unchanged even when set to 0 (XIN clock selected).
- The OCD3 bit is enabled when the OCD0 bit is set to 1 (oscillation stop detection function enabled).
- The OCD3 bit remains 0 (XIN clock oscillates) if bits OCD1 to OCD0 are set to 00b.
- Refer to **Figure 9.9 Procedure for Switching Clock Source from Low-Speed On-Chip Oscillator to XIN Clock** for the switching procedure when the XIN clock re-oscillates after detecting oscillation stop.

Set the PRC0 bit in the PRCR register to 1 (write enabled) before rewriting the OCD register.

### 9.2.5 High-Speed On-Chip Oscillator Control Register 7 (FRA7)

Address 0015h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	—	—	—	—
After Reset	When shipping							

Bit	Function	R/W
b7-b0	32 MHz frequency correction data is stored. The frequency can be adjusted by transferring this value to the FRA3 register and by transferring the correction value in the FRA6 register to the FRA1 register.	R

### 9.2.6 High-Speed On-Chip Oscillator Control Register 0 (FRA0)

Address 0023h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	FRA03	—	FRA01	FRA00
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	FRA00	High-speed on-chip oscillator enable bit	0: High-speed on-chip oscillator off 1: High-speed on-chip oscillator on	R/W
b1	FRA01	High-speed on-chip oscillator select bit <sup>(1)</sup>	0: Low-speed on-chip oscillator selected <sup>(2)</sup> 1: High-speed on-chip oscillator selected	R/W
b2	—	Reserved bit	Set to 0.	R/W
b3	FRA03	fOCO128 clock select bit	0: fOCO-S divided by 128 selected 1: fOCO-F divided by 128 selected	R/W
b4	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b5	—			
b6	—			
b7	—			

Notes:

- Change the FRA01 bit in the following conditions.
  - FRA00 = 1 (high-speed on-chip oscillator on)
  - The CM14 bit in the CM1 register = 0 (low-speed on-chip oscillator on)
  - Bits FRA22 to FRA20 in the FRA2 register:
    - All division mode can be set when VCC = 2.7 V to 5.5 V 000b to 111b
    - Divide ratio of 8 or more when VCC = 1.8 V to 5.5 V 110b to 111b (divide-by-8 or more)
- When setting the FRA01 bit to 0 (low-speed on-chip oscillator selected), do not set the FRA00 bit to 0 (high-speed on-chip oscillator off) at the same time. Set the FRA00 bit to 0 after setting the FRA01 bit to 0.

Set the PRC0 bit in the PRCR register to 1 (write enabled) before rewriting the FRA0 register.

### 9.2.7 High-Speed On-Chip Oscillator Control Register 1 (FRA1)

Address 0024h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	—	—	—	—
After Reset	When shipping							

Bit	Function	R/W
b7-b0	The frequency of the high-speed on-chip oscillator can be adjusted by setting as follows: 40 MHz: FRA1 = value after reset, FRA3 = value after reset 36.864 MHz: Transfer the value in the FRA4 register to the FRA1 register and the value in the FRA5 register to the FRA3 register. 32 MHz: Transfer the value in the FRA6 register to the FRA1 register and the value in the FRA7 register to the FRA3 register.	R/W

Set the PRC0 bit in the PRCR register to 1 (write enabled) before rewriting the FRA1 register.

Also, rewrite the FRA1 register when the FRA00 bit in the FRA0 register is set 0 (high-speed on-chip oscillator off).

### 9.2.8 High-Speed On-Chip Oscillator Control Register 2 (FRA2)

Address 0025h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	—	FRA22	FRA21	FRA20
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	FRA20	High-speed on-chip oscillator frequency switching bit	Division selection	R/W
b1	FRA21		These bits select the division ratio for the high-speed on-chip oscillator clock.	R/W
b2	FRA22		b2 b1 b0 0 0 0: Divide-by-2 mode 0 0 1: Divide-by-3 mode 0 1 0: Divide-by-4 mode 0 1 1: Divide-by-5 mode 1 0 0: Divide-by-6 mode 1 0 1: Divide-by-7 mode 1 1 0: Divide-by-8 mode 1 1 1: Divide-by-9 mode	R/W
b3	—	Reserved bits	Set to 0.	R/W
b4	—			
b5	—			
b6	—			
b7	—			

Set the PRC0 bit in the PRCR register to 1 (write enabled) before rewriting the FRA2 register.

### 9.2.9 Clock Prescaler Reset Flag (CPSRF)

Address 0028h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	CPSR	—	—	—	—	—	—	—

b4	—			
b5	—			
b6	—			
b7	CPSR	Clock prescaler reset flag	Setting this bit to 1 initializes the clock prescaler. (When read, the content is 0)	R/W

**9.2.10 High-Speed On-Chip Oscillator Control Register 4 (FRA4)**

Address 0029h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	—	—	—	—
After Reset	When shipping							

Bit	Function	R/W
b7-b0	36.864 MHz frequency correction data is stored. The frequency can be adjusted by transferring this value to the FRA1 register and by transferring the correction value in the FRA5 register to the FRA3 register.	R

**9.2.11 High-Speed On-Chip Oscillator Control Register 5 (FRA5)**

Address 002Ah

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	—	—	—	—
After Reset	When shipping							

Bit	Function	R/W
b7-b0	36.864 MHz frequency correction data is stored. The frequency can be adjusted by transferring this value to the FRA3 register and by transferring the correction value in the FRA4 register to the FRA1 register.	R

**9.2.12 High-Speed On-Chip Oscillator Control Register 6 (FRA6)**

Address 002Bh

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	—	—	—	—
After Reset	When shipping							

Bit	Function	R/W
b7-b0	32 MHz frequency correction data is stored. The frequency can be adjusted by transferring this value to the FRA1 register and by transferring the correction value in the FRA7 register to the FRA3 register.	R

**9.2.13 High-Speed On-Chip Oscillator Control Register 3 (FRA3)**

Address 002Fh

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	—	—	—	—
After Reset	When shipping							

Bit	Function	R/W
b7-b0	The frequency of the high-speed on-chip oscillator can be adjusted by setting as follows: 40 MHz: FRA1 = value after reset, FRA3 = value after reset 36.864 MHz: Transfer the value in the FRA4 register to the FRA1 register and the value in the FRA5 register to the FRA3 register. 32 MHz: Transfer the value in the FRA6 register to the FRA1 register and the value in the FRA7 register to the FRA3 register.	R/W

Set the PRC0 bit in the PRCR register to 1 (write enabled) before rewriting the FRA3 register.

Also, rewrite the FRA3 register when the FRA00 bit in the FRA0 register is set 0 (high-speed on-chip oscillator off).

### 9.2.14 Voltage Detect Register 2 (VCA2)

Address 0034h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	VCA27	VCA26	VCA25	—	—	—	—	VCA20
After Reset	0	0	0	0	0	0	0	0

The above applies when the LVDAS bit in the OFS register is set to 1.

After Reset	0	0	1	0	0	0	0	0
-------------	---	---	---	---	---	---	---	---

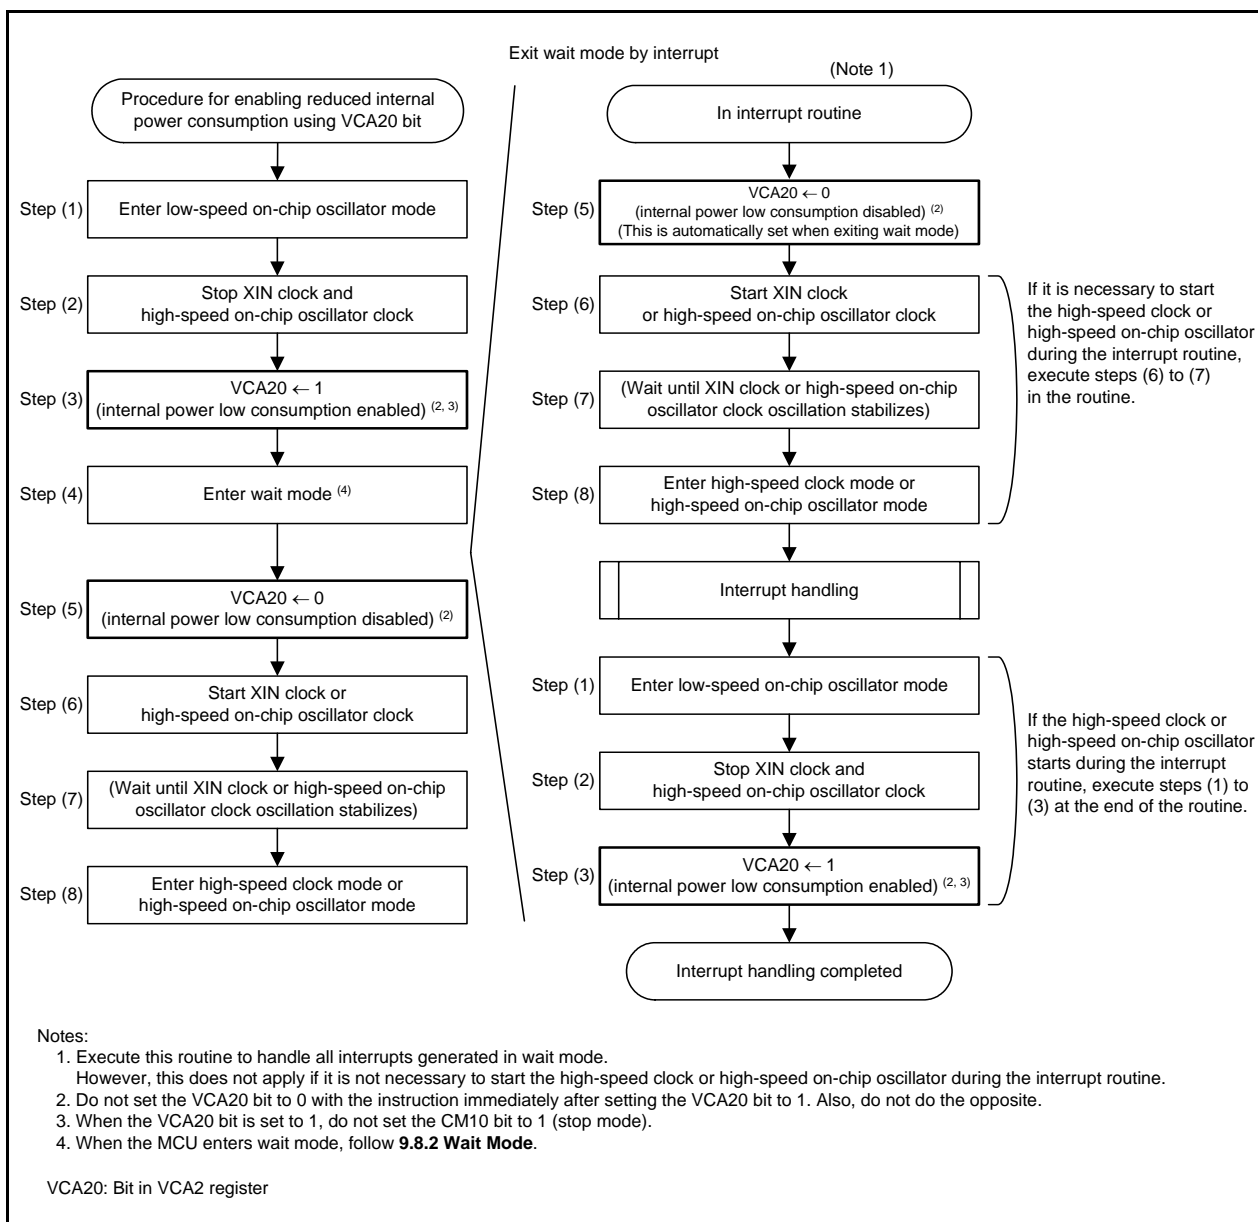

The above applies when the LVDAS bit in the OFS register is set to 0.

Bit	Symbol	Bit Name	Function	R/W
b0	VCA20	Internal power low consumption enable bit <sup>(1)</sup>	0: Low consumption disabled 1: Low consumption enabled <sup>(2)</sup>	R/W
b1	—	Reserved bits	Set to 0.	R/W
b2	—			
b3	—			
b4	—			
b5	VCA25	Voltage detection 0 enable bit <sup>(3)</sup>	0: Voltage detection 0 circuit disabled 1: Voltage detection 0 circuit enabled	R/W
b6	VCA26	Voltage detection 1 enable bit <sup>(4)</sup>	0: Voltage detection 1 circuit disabled 1: Voltage detection 1 circuit enabled	R/W
b7	VCA27	Voltage detection 2 enable bit <sup>(5)</sup>	0: Voltage detection 2 circuit disabled 1: Voltage detection 2 circuit enabled	R/W

Notes:

1. Use the VCA20 bit only when the MCU enters wait mode. To set the VCA20 bit, follow the procedure shown in **Figure 9.3 Procedure for Reducing Internal Power Consumption Using VCA20 bit.**
2. When the VCA20 bit is set to 1 (low consumption enabled), do not set the CM10 bit in the CM1 register to 1 (stop mode).
3. When writing to the VCA25 bit, set a value after reset.
4. To use the voltage detection 1 interrupt or the VW1C3 bit in the VW1C register, set the VCA26 bit to 1. After the VCA26 bit is set to 1 from 0, allow  $t_d(E-A)$  to elapse before the voltage detection 1 circuit starts operation.
5. To use the voltage detection 2 interrupt or the VCA13 bit in the VCA1 register, set the VCA27 bit to 1. After the VCA27 bit is set to 1 from 0, allow  $t_d(E-A)$  to elapse before the voltage detection 2 circuit starts operation.

Set the PRC3 bit in the PRCR register to 1 (write enabled) before rewriting the VCA2 register.

**Figure 9.3 Procedure for Reducing Internal Power Consumption Using VCA20 bit**

The clocks generated by the clock generation circuits are described below.

### 9.3 XIN Clock

The XIN clock is supplied by the XIN clock oscillation circuit. This clock is used as the clock source for the CPU and peripheral function clocks. The XIN clock oscillation circuit is configured by connecting a resonator between pins XIN and XOUT. The XIN clock oscillation circuit includes an on-chip feedback resistor, which is disconnected from the oscillation circuit in stop mode in order to reduce the amount of power consumed by the chip. The XIN clock oscillation circuit may also be configured by feeding an externally generated clock to the XOUT pin.

Figure 9.4 shows Examples of XIN Clock Connection Circuit.

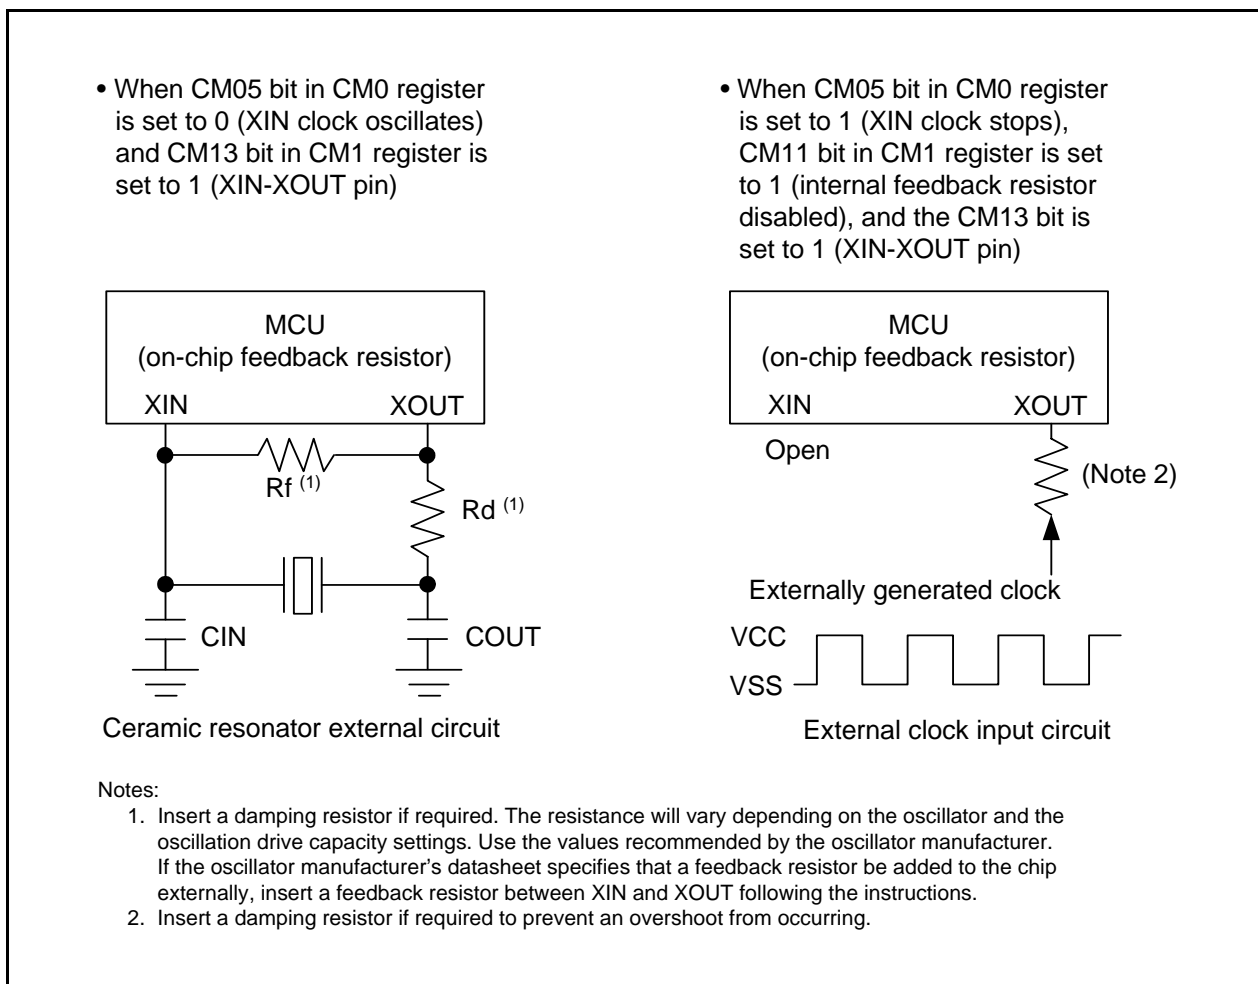

During and after a reset, the XIN clock stops.

After setting the CM13 bit in the CM1 register to 1 (XIN-XOUT pin), the XIN clock starts oscillating when the CM05 bit in the CM0 register is set to 0 (XIN clock oscillates). After the XIN clock oscillation stabilizes, the XIN clock is used as the CPU clock source when the OCD2 bit in the OCD register is set to 0 (XIN clock selected).

The power consumption can be reduced by setting the CM05 bit in the CM0 register to 1 (XIN clock stops) if the OCD2 bit is set to 1 (on-chip oscillator clock selected).

When an externally generated clock is input to the XOUT pin, the XIN clock does not stop even if the CM05 bit is set to 1. If necessary, use an external circuit to stop the clock.

In stop mode, all clocks including the XIN clock stop. Refer to **9.6 Power Control** for details.

**Figure 9.4 Examples of XIN Clock Connection Circuit**

## 9.4 On-Chip Oscillator Clock

The on-chip oscillator clock is supplied by the on-chip oscillator (high-speed on-chip oscillator or low-speed on-chip oscillator). This clock is selected by the FRA01 bit in the FRA0 register.

### 9.4.1 Low-Speed On-Chip Oscillator Clock

The clock generated by the low-speed on-chip oscillator is used as the clock source for the CPU clock, peripheral function clock, fOCO, fOCO-S, and fOCO128.

After a reset, the on-chip oscillator clock generated by the low-speed on-chip oscillator divided by 1 (no division) is selected as the CPU clock.

If the XIN clock stops oscillating when bits OCD1 to OCD0 in the OCD register are set to 11b, the low-speed on-chip oscillator automatically starts operating and supplies the necessary clock for the MCU.

The frequency of the low-speed on-chip oscillator varies depending on the supply voltage and the operating ambient temperature. Application products must be designed with sufficient margin to allow for frequency changes.

### 9.4.2 High-Speed On-Chip Oscillator Clock

The clock generated by the high-speed on-chip oscillator is used as the clock source for the CPU clock, peripheral function clock, fOCO, fOCO-F, fOCO40M, and fOCO128.

To use the high-speed on-chip oscillator clock as the clock source for the CPU clock, peripheral clock, fOCO, and fOCO-F, set bits FRA20 to FRA22 in the FRA2 register as follows:

- All division mode can be set when VCC = 2.7 V to 5.5 V      000b to 111b
- Divide ratio of 8 or more when VCC = 1.8 V to 5.5 V      110b to 111b (divide by 8 or more)

After a reset, the on-chip oscillator clock generated by the high-speed on-chip oscillator stops. Oscillation is started by setting the FRA00 bit in the FRA0 register to 1 (high-speed on-chip oscillator on).

Frequency correction data is stored in registers FRA4 to FRA7.

To adjust the frequency of the high-speed on-chip oscillator clock to 36.864 MHz, first transfer the correction value in the FRA4 register to the FRA1 register and the correction value in the FRA5 register to the FRA3 register before using the values. This enables the setting errors of bit rates such as 9600 bps and 38400 bps to be 0% when the serial interface is used in UART mode (refer to **Tables 20.8 and 21.8 Bit Rate Setting Example in UART Mode (Internal Clock Selected)**).

To adjust the frequency of the high-speed on-chip oscillator clock to 32 MHz, first transfer the correction value in the FRA6 register to the FRA1 register and the correction value in the FRA7 register to the FRA3 register before using the values.

## 9.5 CPU Clock and Peripheral Function Clock

There are a CPU clock to operate the CPU and a peripheral function clock to operate the peripheral functions. Refer to **Figure 9.1 Clock Generation Circuit**.

### 9.5.1 System Clock

The system clock is the clock source for the CPU and peripheral function clocks. The XIN clock or the on-chip oscillator clock can be selected.

### 9.5.2 CPU Clock

The CPU clock is an operating clock for the CPU and the watchdog timer.

The system clock divided by 1 (no division), 2, 4, 8, or 16 is used as the CPU clock. Use the CM06 bit in the CM0 register and bits CM16 and CM17 in the CM1 register to select the value of the division.

After a reset, the low-speed on-chip oscillator clock divided by 1 (no division) is used as the CPU clock.

When the MCU enters stop mode, the CM06 bit is set to 1 (divide-by-8 mode). To enter stop mode, set the CM35 bit in the CM3 register to 0 (settings of CM06 in CM0 register and bits CM16 and CM17 in CM1 register enabled).

### 9.5.3 Peripheral Function Clock (f1, f2, f4, f8, and f32)

The peripheral function clock is an operating clock for the peripheral functions.

The  $f_i$  ( $i = 1, 2, 4, 8$ , and  $32$ ) clock is generated by the system clock divided by  $i$ . It is used for timers RA, RB, RC, the serial interface, and the A/D converter.

If the MCU enters wait mode after the CM02 bit in the CM0 register is set to 1 (peripheral function clock stops in wait mode), the  $f_i$  clock stops.

### 9.5.4 fOCO

fOCO is an operating clock for the peripheral functions.

This clock runs at the same frequency as the on-chip oscillator clock and can be used as the source for timer RA.

In wait mode, the fOCO clock does not stop.

### 9.5.5 fOCO40M

fOCO40M is used as the count source for timer RC.

This clock is generated by the high-speed on-chip oscillator and supplied by setting the FRA00 bit to 1.

In wait mode, the fOCO40M clock does not stop.

This clock can be used with supply voltage  $VCC = 2.7\text{ V}$  to  $5.5\text{ V}$ .

### 9.5.6 fOCO-F

fOCO-F is used as the count source for timer RC and the A/D converter.

fOCO-F is a clock generated by the high-speed on-chip oscillator and divided by  $i$  ( $i = 2, 3, 4, 5, 6, 7, 8$ , and  $9$ ; divide ratio selected by the FRA2 register). This clock is supplied by setting the FRA00 bit to 1.

In wait mode, the fOCO-F clock does not stop.

### 9.5.7 fOCO-S

fOCO-S is an operating clock for the voltage detection circuit.

This clock is generated by the low-speed on-chip oscillator and supplied by setting the CM14 bit to 0 (low-speed on-chip oscillator on).

In wait mode, the fOCO-S clock does not stop.

### 9.5.8 fOCO128

fOCO128 is a clock generated by dividing fOCO-S or fOCO-F by 128. When the FRA03 bit is set to 0, fOCO-S divided by 128 is selected. When this bit is set to 1, fOCO-F divided by 128 is selected.

fOCO128 is configured as the capture signal used in the TRCGRA register for timer RC.

### 9.5.9 fOCO-WDT

fOCO-WDT is an operating clock for the watchdog timer.

This clock is generated by the low-speed on-chip oscillator for the watchdog timer and supplied by setting the CSPRO bit in the CSPR register to 1 (count source protect mode enabled).

In count source protection mode for the watchdog timer, the fOCO-WDT clock does not stop.

## 9.6 Power Control

There are three power control modes. All modes other than wait mode and stop mode are referred to as standard operating mode.

### 9.6.1 Standard Operating Mode

Standard operating mode is further separated into four modes.

In standard operating mode, the CPU and peripheral function clocks are supplied to operate the CPU and the peripheral functions. Power consumption control is enabled by controlling the CPU clock frequency. The higher the CPU clock frequency, the more processing power increases. The lower the CPU clock frequency, the more power consumption decreases. If unnecessary oscillator circuits stop, power consumption is further reduced.

Before the clock sources for the CPU clock can be switched over, the new clock source needs to be oscillating and stable. Allow sufficient wait time in a program until oscillation stabilizes before switching the clock.

**Table 9.2 Settings and Modes of Clock Associated Bits**

Modes		OCD Register	CM1 Register			CM0 Register		FRA0 Register	
		OCD2	CM17, CM16	CM14	CM13	CM06	CM05	FRA01	FRA00
High-speed clock mode	No division	0	00b	—	1	0	0	—	—
	Divide-by-2	0	01b	—	1	0	0	—	—
	Divide-by-4	0	10b	—	1	0	0	—	—
	Divide-by-8	0	—	—	1	1	0	—	—
	Divide-by-16	0	11b	—	1	0	0	—	—
High-speed on-chip oscillator mode	No division	1	00b	—	—	0	—	1	1
	Divide-by-2	1	01b	—	—	0	—	1	1
	Divide-by-4	1	10b	—	—	0	—	1	1
	Divide-by-8	1	—	—	—	1	—	1	1
	Divide-by-16	1	11b	—	—	0	—	1	1
Low-speed on-chip oscillator mode	No division	1	00b	0	—	0	—	0	—
	Divide-by-2	1	01b	0	—	0	—	0	—
	Divide-by-4	1	10b	0	—	0	—	0	—
	Divide-by-8	1	—	0	—	1	—	0	—
	Divide-by-16	1	11b	0	—	0	—	0	—

—: Indicates that either 0 or 1 can be set.

### 9.6.1.1 High-Speed Clock Mode

The XIN clock divided by 1 (no division), 2, 4, 8, or 16 is used as the CPU clock. If the CM14 bit is set to 0 (low-speed on-chip oscillator on) or the FRA00 bit in the FRA0 register is set to 1 (high-speed on-chip oscillator on), fOCO can be used for timer RA.

Also, if the FRA00 bit is set to 1, fOCO40M can be used for timer RC.

If the CM14 bit is set to 0 (low-speed on-chip oscillator on), fOCO-S can be used for the voltage detection circuit.

### 9.6.1.2 High-Speed On-Chip Oscillator Mode

The high-speed on-chip oscillator is used as the on-chip oscillator clock when the FRA00 bit in the FRA0 register is set to 1 (high-speed on-chip oscillator on) and the FRA01 bit in the FRA0 register is set to 1. The on-chip oscillator divided by 1 (no division), 2, 4, 8, or 16 is used as the CPU clock. If the FRA00 bit is set to 1, fOCO40M can be used for timer RC.

Also, if the CM14 bit is set to 0 (low-speed on-chip oscillator on), fOCO-S can be used for the voltage detection circuit.

### 9.6.1.3 Low-Speed On-Chip Oscillator Mode

If the CM14 bit in the CM1 register is set to 0 (low-speed on-chip oscillator on) and the FRA01 bit in the FRA0 register is set to 0, the low-speed on-chip oscillator is used as the on-chip oscillator clock. At this time, the on-chip oscillator clock divided by 1 (no division), 2, 4, 8 or 16 is used as the CPU clock. The on-chip oscillator clock is also the clock source for the peripheral function clocks. If the FRA00 bit is set to 1, fOCO40M can be used for timer RC.

Also, if the CM14 bit is set to 0 (low-speed on-chip oscillator on), fOCO-S can be used for the voltage detection circuit.

In this mode, low consumption operation is enabled by stopping the XIN clock and the high-speed on-chip oscillator, and by setting the FMR27 bit in the FMR2 register to 1 (low-consumption-current read mode enabled). When the CPU clock is set to the low-speed on-chip oscillator clock divided by 4, 8, or 16, low-consumption-current read mode can be used. When divided by 1 (no division) or divided by 2 is set, do not use low-consumption-current read mode. After setting the divide ratio of the CPU clock, set the FMR27 bit to 1.

To enter wait mode from low-speed on-chip oscillator mode, lower consumption current in wait mode is enabled by setting the VCA20 bit in the VCA2 register to 1 (internal power low consumption enabled).

To reduce the power consumption, refer to **26. Reducing Power Consumption**.

## 9.6.2 Wait Mode

Since the CPU clock stops in wait mode, the CPU operating with the CPU clock and the watchdog timer when count source protection mode is disabled stop. Since the XIN clock and on-chip oscillator clock do not stop, the peripheral functions using these clocks continue operating.

### 9.6.2.1 Peripheral Function Clock Stop Function

If the CM02 bit is set to 1 (peripheral function clock stops in wait mode), the f1, f2, f4, f8, and f32 clocks stop in wait mode. This reduces power consumption.

### 9.6.2.2 Entering Wait Mode

The MCU enters wait mode by executing the WAIT instruction or setting the CM30 bit in the CM3 register to 1 (MCU enters wait mode).

When the OCD2 bit in the OCD register is set to 1 (on-chip oscillator selected as system clock), set the OCD1 bit in the OCD register to 0 (oscillation stop detection interrupt disabled) before executing the WAIT instruction or setting the CM30 bit in the CM3 register to 1 (MCU enters wait mode).

If the MCU enters wait mode while the OCD1 bit is set to 1 (oscillation stop detection interrupt enabled), current consumption is not reduced because the CPU clock does not stop.

Enter wait mode after setting the FMR27 bit in the FMR2 register to 0 (low-current-consumption read mode disabled). Do not enter wait mode while the FMR27 bit is 1 (low-current-consumption read mode enabled).

### 9.6.2.3 Pin Status in Wait Mode

The I/O port retains the status immediately before the MCU enters wait mode.

### 9.6.2.4 Exiting Wait Mode

The MCU exits wait mode by a reset or peripheral function interrupt.

The peripheral function interrupts are affected by the CM02 bit. When the CM02 bit is set to 0 (peripheral function clock does not stop in wait mode), the peripheral function interrupts other than A/D conversion interrupts can be used to exit wait mode. When the CM02 bit is set to 1 (peripheral function clock stops in wait mode), the peripheral functions using the peripheral function clock stop and the peripheral functions operating with external signals or the on-chip oscillator clock can be used to exit wait mode.

Table 9.3 lists Interrupts to Exit Wait Mode and Usage Conditions.

**Table 9.3 Interrupts to Exit Wait Mode and Usage Conditions**

Interrupt	CM02 = 0	CM02 = 1
Serial interface interrupt	Usable when operating with internal or external clock	Usable when operating with external clock
Key input interrupt	Usable	Usable
A/D conversion interrupt	(Do not use)	(Do not use)
Timer RA interrupt	Usable in all modes	Usable if there is no filter in event counter mode. Usable by selecting fOCO as count source.
Timer RB interrupt	Usable in all modes	(Do not use)
Timer RC interrupt	Usable in all modes	(Do not use)
$\overline{\text{INT}}$ interrupt	Usable	Usable ( $\overline{\text{INT0}}$ to $\overline{\text{INT3}}$ can be used if there is no filter.)
Voltage monitor 1 interrupt	Usable	Usable
Voltage monitor 2 interrupt	Usable	Usable
Oscillation stop detection interrupt	Usable	(Do not use)

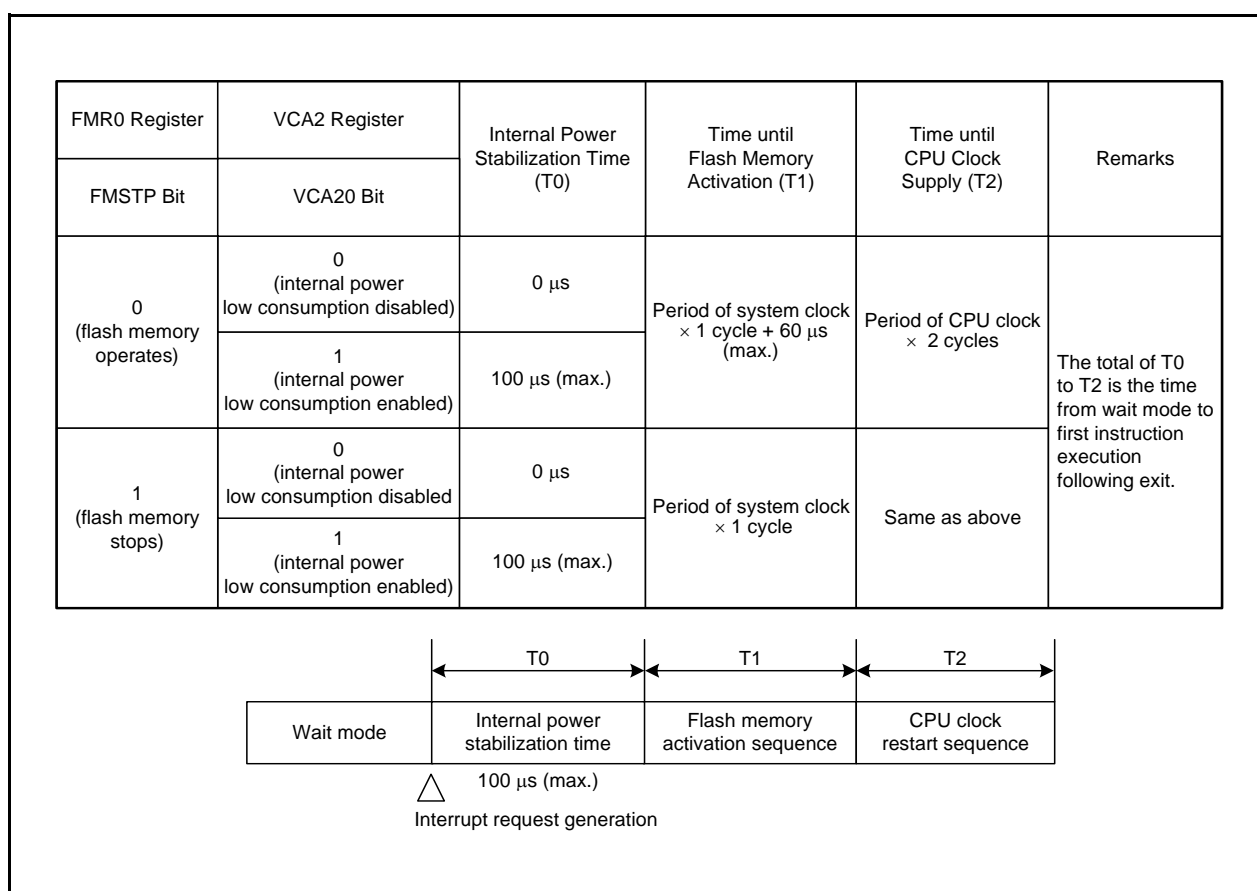

Figure 9.5 shows the Time from Wait Mode to First Instruction Execution following Exit after CM30 Bit in CM3 Register is Set to 1 (MCU Enters Wait Mode).

To use a peripheral function interrupt to exit wait mode, set up the following before setting the CM30 bit to 1.

- (1) Set the I flag to 0 (maskable interrupt disabled)
- (2) Set the interrupt priority level in bits ILVL2 to ILVL0 in the interrupt control registers of the peripheral function interrupts to be used for exiting wait mode. Set bits ILVL2 to ILVL0 of the peripheral function interrupts that are not to be used for exiting wait mode to 000b (interrupt disabled).
- (3) Operate the peripheral function to be used for exiting wait mode.

When the MCU exits by a peripheral function interrupt, the time (number of cycles) between interrupt request generation and interrupt routine execution is determined by the settings of the FMSTP bit in the FMR0 register and the VCA20 bit in the VCA2 register, as shown in Figure 9.5.

The clock set by bits CM35, CM36, and CM37 in the CM3 register is used as the CPU clock when the MCU exits wait mode by a peripheral function interrupt. At this time, the CM06 bit in the CM0 register and bits CM16 and CM17 in the CM1 register automatically change.

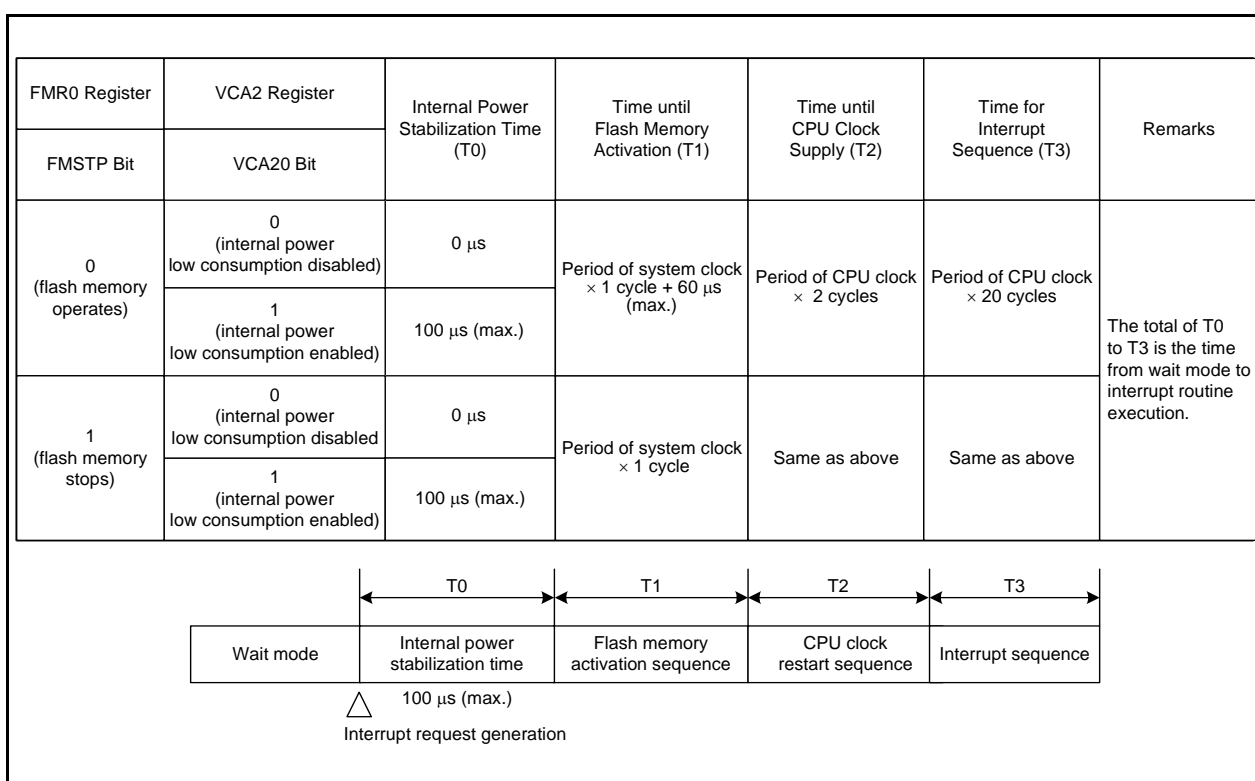

**Figure 9.5 Time from Wait Mode to First Instruction Execution following Exit after CM30 Bit in CM3 Register is Set to 1 (MCU Enters Wait Mode)**

Figure 9.6 shows the Time from Wait Mode to Interrupt Routine Execution after WAIT instruction is Executed. To use a peripheral function interrupt to exit wait mode, set up the following before executing the WAIT instruction.

- (1) Set the interrupt priority level in bits ILVL2 to ILVL0 of the peripheral function interrupts to be used for exiting stop mode. Set bits ILVL2 to ILVL0 of the peripheral function interrupts that are not to be used for exiting stop mode to 000b (interrupt disabled).
- (2) Set the I flag to 1.
- (3) Operate the peripheral function to be used for exiting stop mode.

When the MCU exits by a peripheral function interrupt, the time (number of cycles) between interrupt request generation and interrupt routine execution is determined by the settings of the FMSTP bit in the FMR0 register and the VCA20 bit in the VCA2 register, as shown in Figure 9.6.

The clock set by bits CM35, CM36, and CM37 in the CM3 register is used as the CPU clock when the MCU exits wait mode by a peripheral function interrupt. At this time, the CM06 bit in the CM0 register and bits CM16 and CM17 in the CM1 register automatically change.

**Figure 9.6 Time from Wait Mode to Interrupt Routine Execution after WAIT instruction is Executed**

### 9.6.3 Stop Mode

Since all oscillator circuits except fOCO-WDT stop in stop mode, the CPU and peripheral function clocks stop and the CPU and the peripheral functions operating with these clocks also stop. The least power required to operate the MCU is in stop mode. If the voltage applied to the VCC pin is VRAM or more, the contents of internal RAM is retained.

The peripheral functions clocked by external signals continue operating.

Table 9.4 lists Interrupts to Exit Stop Mode and Usage Conditions.

**Table 9.4 Interrupts to Exit Stop Mode and Usage Conditions**

Interrupt	Usage Conditions
Key input interrupt	Usable
$\overline{\text{INT0}}$ to $\overline{\text{INT3}}$ interrupt	Usable if there is no filter
Timer RA interrupt	Usable if there is no filter when external pulse is counted in event counter mode
Serial interface interrupt	When external clock selected
Voltage monitor 1 interrupt	Usable in digital filter disabled mode (VW1C1 bit in VW1C register is set to 1)
Voltage monitor 2 interrupt	Usable in digital filter disabled mode (VW2C1 bit in VW2C register is set to 1)

#### 9.6.3.1 Entering Stop Mode

The MCU enters stop mode when the CM10 bit in the CM1 register is set to 1 (all clocks stop). At the same time, the CM06 bit in the CM0 register is set to 1 (divide-by-8 mode).

To use stop mode, set the following before the MCU enters stop mode:

- Bits OCD1 to OCD0 in the OCD register = 00b
- CM35 bit in CM3 register = 0 (settings of CM06 bit in CM0 register and bits CM16 and CM17 in CM1 register enabled)

Enter stop mode after setting the FMR27 bit in the FMR2 register to 0 (low-current-consumption read mode disabled). Do not enter stop mode while the FMR27 bit is 1 (low-current-consumption read mode enabled).

#### 9.6.3.2 Pin Status in Stop Mode

The I/O port retains the status before the MCU enters stop mode.

However, when the CM13 bit in the CM1 register is set to 1 (XIN-XOUT pin), the XOUT(P4\_7) pin is held "H". When the CM13 bit is set to 0 (input ports P4\_6 and P4\_7), the P4\_7(XOUT pin) is held in an input status.

### 9.6.3.3 Exiting Stop Mode

The MCU exits stop mode by a reset or peripheral function interrupt.

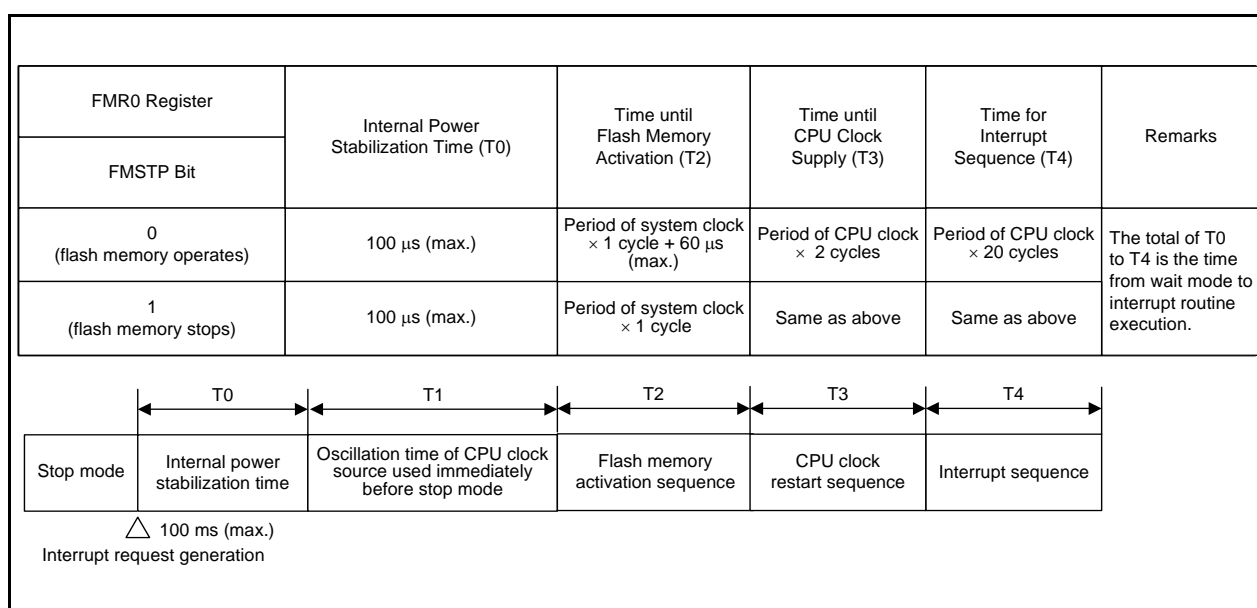

Figure 9.7 shows the Time from Stop Mode to Interrupt Routine Execution.

To use a peripheral function interrupt to exit stop mode, set up the following before setting the CM10 bit to 1.

- (1) Set the interrupt priority level in bits ILVL2 to ILVL0 of the peripheral function interrupts to be used for exiting stop mode. Set bits ILVL2 to ILVL0 of the peripheral function interrupts that are not to be used for exiting stop mode to 000b (interrupt disabled).
- (2) Set the I flag to 1.
- (3) Operate the peripheral function to be used for exiting stop mode.

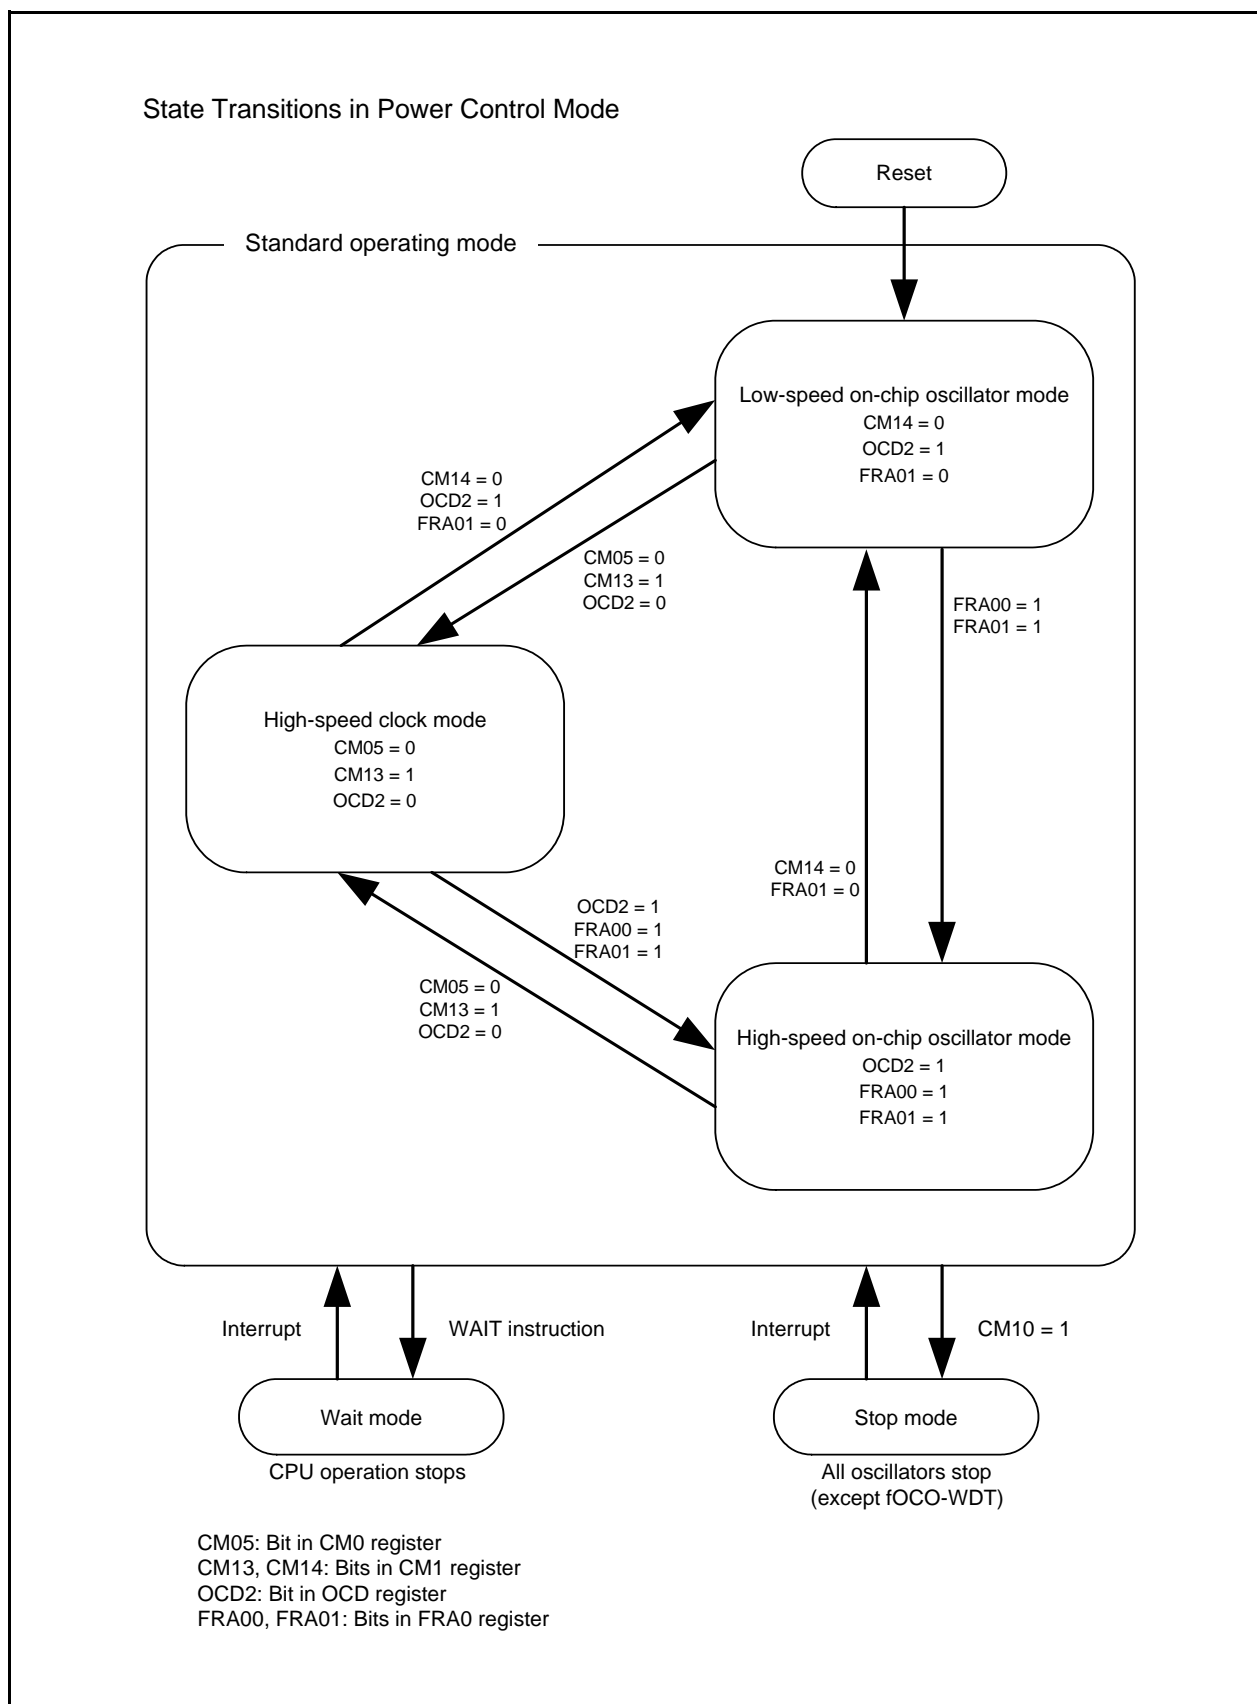

When the MCU exits stop mode by a peripheral function interrupt, the interrupt sequence is executed when an interrupt request is generated and the CPU clock supply starts.

The clock used immediately before stop mode divided by 8 is used as the CPU clock when the MCU exits stop mode by a peripheral function interrupt. To enter stop mode, set the CM35 bit in the CM3 register to 0 (settings of CM06 bit in CM0 register and bits CM16 and CM17 in CM1 register enabled)

**Figure 9.7 Time from Stop Mode to Interrupt Routine Execution**

Figure 9.8 shows the State Transitions in Power Control Mode.

**Figure 9.8 State Transitions in Power Control Mode**

## 9.7 Oscillation Stop Detection Function

The oscillation stop detection function detects the stop of the XIN clock oscillating circuit.

The oscillation stop detection function can be enabled and disabled by the OCD0 bit in the OCD register.

Table 9.5 lists the Specifications of Oscillation Stop Detection Function.

When the XIN clock is the CPU clock source and bits OCD1 to OCD0 are set to 11b, the MCU is placed in the following state if the XIN clock stops.

- OCD2 bit in OCD register = 1 (on-chip oscillator clock selected)
- OCD3 bit in OCD register = 1 (XIN clock stops)
- CM14 bit in CM1 register = 0 (low-speed on-chip oscillator oscillates)
- Oscillation stop detection interrupt request is generated

**Table 9.5 Specifications of Oscillation Stop Detection Function**

Item	Specification
Oscillation stop detection clock and frequency bandwidth	$f(\text{XIN}) \geq 2 \text{ MHz}$
Enabled condition for oscillation stop detection function	Bits OCD1 to OCD0 set to 11b
Operation at oscillation stop detection	Oscillation stop detection interrupt generated

### 9.7.1 How to Use Oscillation Stop Detection Function

- The oscillation stop detection interrupt shares a vector with the voltage monitor 1 interrupt, the voltage monitor 2 interrupt, and the watchdog timer interrupt. To use the oscillation stop detection interrupt and watchdog timer interrupt, the interrupt source needs to be determined.

Table 9.6 lists the Determination of Interrupt Sources for Oscillation Stop Detection, Watchdog Timer, Voltage Monitor 1, or Voltage Monitor 2 Interrupt. Figure 9.10 shows an Example of Determining Interrupt Sources for Oscillation Stop Detection, Watchdog Timer, Voltage Monitor 1, or Voltage Monitor 2 Interrupt.

- When the XIN clock restarts after oscillation stop, switch the XIN clock to the clock source for the CPU clock and the peripheral functions by a program.

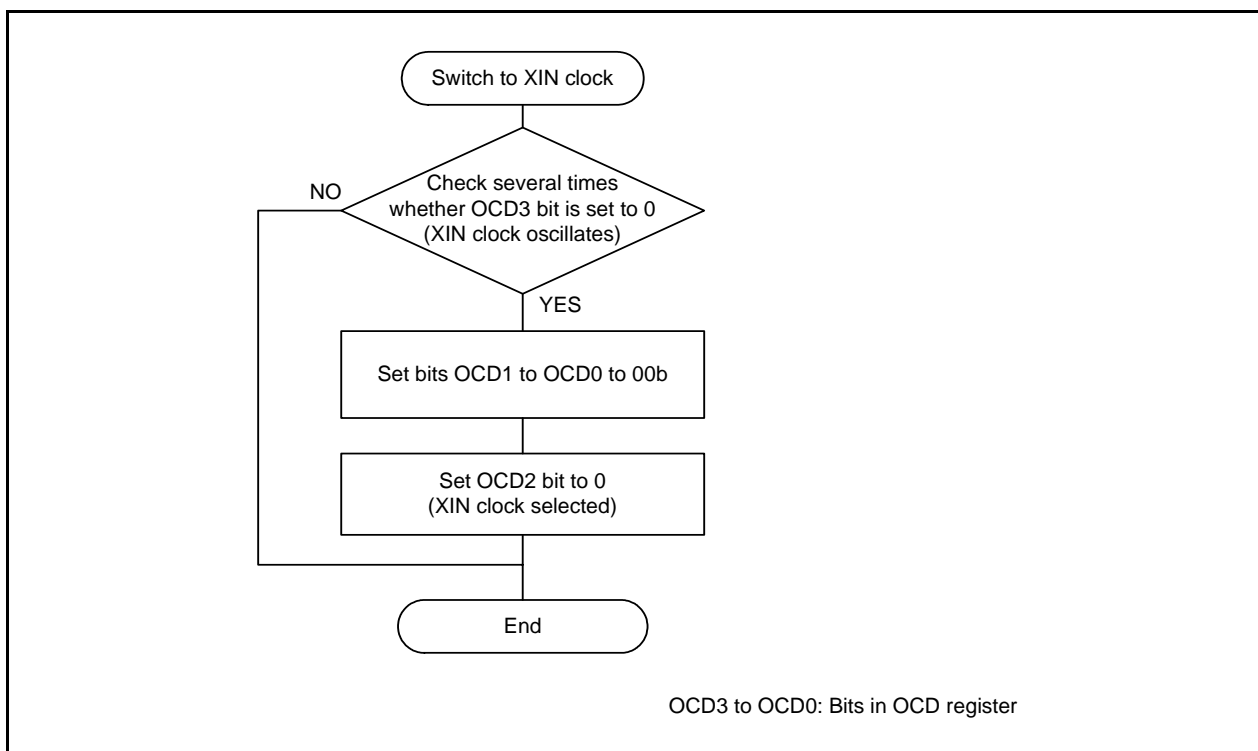

Figure 9.9 shows the Procedure for Switching Clock Source from Low-Speed On-Chip Oscillator to XIN Clock.

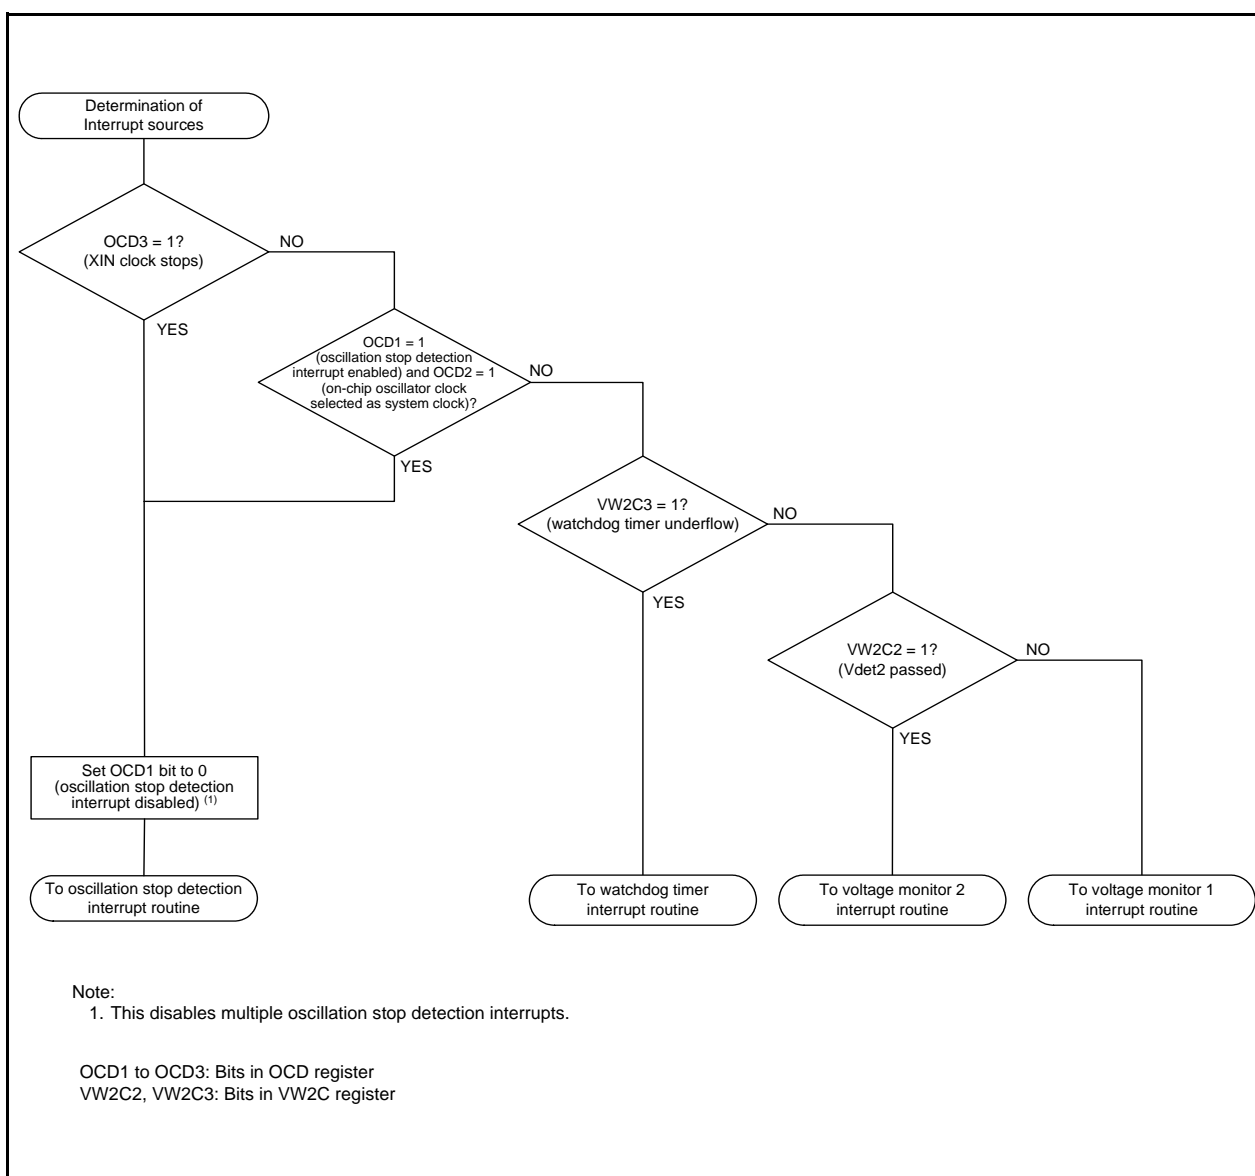

- To enter wait mode while the oscillation stop detection function is used, set the CM02 bit to 0 (peripheral function clock does not stop in wait mode).
- Since the oscillation stop detection function is a function for cases where the XIN clock is stopped by an external cause, set bits OCD1 to OCD0 to 00b to stop or start the XIN clock by a program (select stop mode or change the CM05 bit).
- This function cannot be used when the XIN clock frequency is below 2 MHz. In this case, set bits OCD1 to OCD0 to 00b.
- To use the low-speed on-chip oscillator clock as the clock source for the CPU clock and the peripheral functions after detecting the oscillation stop, set the FRA01 bit in the FRA0 register to 0 (low-speed on-chip oscillator selected) and bits OCD1 to OCD0 to 11b.

To use the high-speed on-chip oscillator clock as the clock source for the CPU clock and the peripheral functions after detecting the oscillation stop, first set the FRA00 bit to 1 (high-speed on-chip oscillator oscillates) and the FRA01 bit to 1 (high-speed on-chip oscillator selected). Then set bits OCD1 to OCD0 to 11b.

**Table 9.6** Determination of Interrupt Sources for Oscillation Stop Detection, Watchdog Timer, Voltage Monitor 1, or Voltage Monitor 2 Interrupt

Generated Interrupt Source	Bit Indicating Interrupt Source
Oscillation stop detection ((a) or (b))	(a) OCD3 bit in OCD register = 1
	(b) OCD1 to OCD0 bits in OCD register = 11b and OCD2 bit = 1
Watchdog timer	VW2C3 bit in VW2C register = 1
Voltage monitor 1	VW1C2 bit in VW1C register = 1
Voltage monitor 2	VW2C2 bit in VW2C register = 1

**Figure 9.9** Procedure for Switching Clock Source from Low-Speed On-Chip Oscillator to XIN Clock

**Figure 9.10** Example of Determining Interrupt Sources for Oscillation Stop Detection, Watchdog Timer, Voltage Monitor 1, or Voltage Monitor 2 Interrupt

## 9.8 Notes on Clock Generation Circuit

### 9.8.1 Stop Mode

To enter stop mode, set the FMR01 bit in the FMR0 register to 0 (CPU rewrite mode disabled) and then the CM10 bit in the CM1 register to 1 (stop mode). An instruction queue pre-reads 4 bytes from the instruction which sets the CM10 bit to 1 (stop mode) and the program stops.

Insert at least four NOP instructions following the JMP.B instruction after the instruction which sets the CM10 bit to 1.

- Program example to enter stop mode

```

BCLR    1, FMR0    ; CPU rewrite mode disabled
BCLR    7, FMR2    ; Low-current-consumption read mode disabled
BSET    0, PRCR    ; Writing to CM1 register enabled
FSET    I          ; Enable interrupt
BSET    0, CM1     ; Stop mode
JMP.B   LABEL_001
LABEL_001:
NOP
NOP
NOP
NOP

```

### 9.8.2 Wait Mode

To enter wait mode by setting the CM30 bit to 1, set the FMR01 bit in the FMR0 register to 0 (CPU rewrite mode disabled) before setting the CM30 bit to 1.

To enter wait mode with the WAIT instruction, set the FMR01 bit in the FMR0 register to 0 (CPU rewrite mode disabled) and then execute the WAIT instruction. An instruction queue pre-reads 4 bytes from the instruction to set the CM30 bit to 1 (MCU enters wait mode) or the WAIT instruction, and then the program stops. Insert at least four NOP instructions after the instruction to set the CM30 bit to 1 (MCU enters wait mode) or the WAIT instruction.

- Program example to execute the WAIT instruction

```

BCLR    1, FMR0    ; CPU rewrite mode disabled
BCLR    7, FMR2    ; Low-current-consumption read mode disabled
FSET    I          ; Enable interrupt
WAIT    ; Wait mode
NOP
NOP
NOP
NOP

```

- Program example to execute the instruction to set the CM30 bit to 1

```

BCLR    1, FMR0    ; CPU rewrite mode disabled
BCLR    7, FMR2    ; Low-current-consumption read mode disabled
BSET    0, PRCR    ; Writing to CM3 register enabled
FCLR    I          ; Interrupt disabled
BSET    0, CM3     ; Wait mode
NOP
NOP
NOP
NOP
BCLR    0, PRCR    ; Writing to CM3 register disabled
FSET    I          ; Interrupt enabled

```

### 9.8.3 Oscillation Stop Detection Function

Since the oscillation stop detection function cannot be used if the XIN clock frequency is below 2 MHz, set bits OCD1 to OCD0 to 00b.

### 9.8.4 Oscillation Circuit Constants

Consult the oscillator manufacturer to determine the optimal oscillation circuit constants for the user system. To use the MCU with supply voltage below  $VCC = 2.7\text{ V}$ , it is recommended to set the CM11 bit in the CM1 register to 1 (on-chip feedback resistor disabled) and connect the feedback resistor to the chip externally.

## 10. Protection

The protection function protects important registers from being easily overwritten if a program runs out of control.

The registers protected by the PRCR register are as follows:

- Registers protected by PRC0 bit: Registers CM0, CM1, CM3, OCD, FRA0, FRA1, FRA2, and FRA3
- Registers protected by PRC1 bit: Registers PM0 and PM1
- Registers protected by PRC2 bit: PD0 register
- Registers protected by PRC3 bit: Registers OCVREFCR, VCA2, VD1LS, VW0C, VW1C, and VW2C

### 10.1 Register

#### 10.1.1 Protect Register (PRCR)

Address 000Ah

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	PRC3	PRC2	PRC1	PRC0
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	PRC0	Protect bit 0	Enables writing to registers CM0, CM1, CM3, OCD, FRA0, FRA1, FRA2, and FRA3. 0: Write disabled 1: Write enabled <sup>(2)</sup>	R/W
b1	PRC1	Protect bit 1	Enables writing to registers PM0 and PM1. 0: Write disabled 1: Write enabled <sup>(2)</sup>	R/W
b2	PRC2	Protect bit 2	Enables writing to the PD0 register. 0: Write disabled 1: Write enabled <sup>(1)</sup>	R/W
b3	PRC3	Protect bit 3	Enables writing to registers OCVREFCR, VCA2, VD1LS, VW0C, VW1C, and VW2C. 0: Write disabled 1: Write enabled <sup>(2)</sup>	R/W
b4	—	Reserved bits	Set to 0.	R/W
b5	—			
b6	—			
b7	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—

Notes:

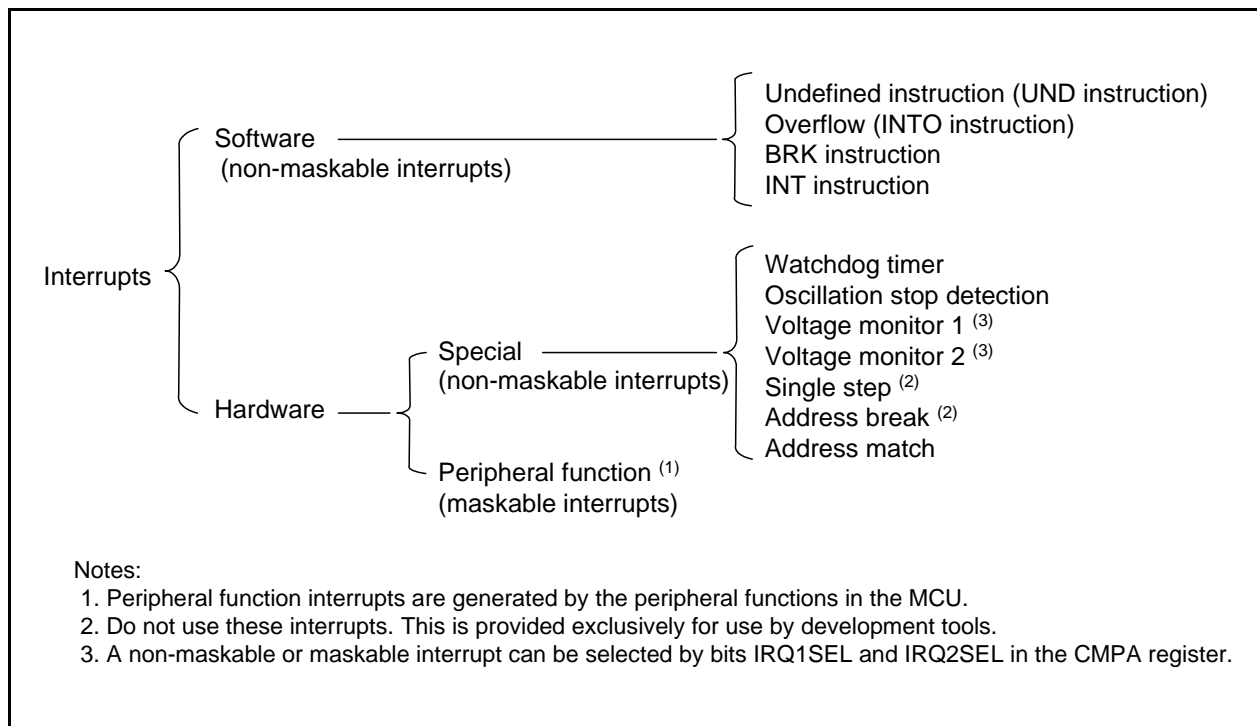

1. The PRC2 bit is set to 0 after setting it to 1 (write enabled) and writing to the SFR area. Change the register protected by the PRC2 bit with the next instruction after that used to set the PRC2 bit to 1. Do not allow interrupts or DTC activation between the instruction to set to the PRC2 bit to 1 and the next instruction.
2. Bits PRC0, PRC1, and PRC3 are not set to 0 even after setting them to 1 (write enabled) and writing to the SFR areas. Set these bits to 0 by a program.

## 11. Interrupts

### 11.1 Overview

#### 11.1.1 Types of Interrupts

Figure 11.1 shows the Types of Interrupts.

**Figure 11.1** Types of Interrupts

- Maskable interrupts: These interrupts are enabled or disabled by the interrupt enable flag (I flag). The interrupt priority **can be changed** based on the interrupt priority level.
- Non-maskable interrupts: These interrupts are not enabled or disabled by the interrupt enable flag (I flag). The interrupt priority **cannot be changed** based on the interrupt priority level.

### 11.1.2 Software Interrupts

A software interrupt is generated when an instruction is executed. Software interrupts are non-maskable.

#### 11.1.2.1 Undefined Instruction Interrupt

An undefined instruction interrupt is generated when the UND instruction is executed.

#### 11.1.2.2 Overflow Interrupt

An overflow interrupt is generated when the O flag is set to 1 (arithmetic operation overflow) and the INTO instruction is executed. Instructions that set the O flag are as follows:

ABS, ADC, ADCF, ADD, CMP, DIV, DIVU, DIVX, NEG, RMPA, SBB, SHA, and SUB.

#### 11.1.2.3 BRK Interrupt

A BRK interrupt is generated when the BRK instruction is executed.

#### 11.1.2.4 INT Instruction Interrupt

An INT instruction interrupt is generated when the INT instruction is executed. Software interrupt numbers 0 to 63 can be specified with the INT instruction. Because some software interrupt numbers are assigned to peripheral function interrupts, the same interrupt routine as for peripheral function interrupts can be executed by executing the INT instruction.

For software interrupt numbers 0 to 31, the U flag is saved on the stack during instruction execution and the U flag is set to 0 (ISP selected) before the interrupt sequence is executed. The U flag is restored from the stack when returning from the interrupt routine. For software interrupt numbers 32 to 63, the U flag does not change state during instruction execution, and the selected SP is used.

### 11.1.3 Special Interrupts

Special interrupts are non-maskable.

#### 11.1.3.1 Watchdog Timer Interrupt

A watchdog timer interrupt is generated by the watchdog timer. For details, refer to **14. Watchdog Timer**.

#### 11.1.3.2 Oscillation Stop Detection Interrupt

An oscillation stop detection interrupt is generated by the oscillation stop detection function. For details of the oscillation stop detection function, refer to **9. Clock Generation Circuit**.

#### 11.1.3.3 Voltage Monitor 1 Interrupt

A voltage monitor 1 interrupt is generated by the voltage detection circuit. A non-maskable or maskable interrupt can be selected by IRQ1SEL bit in the CMPA register. For details of the voltage detection circuit, refer to **6. Voltage Detection Circuit** and for details.

#### 11.1.3.4 Voltage Monitor 2 Interrupt

A voltage monitor 2 interrupt is generated by the voltage detection circuit. A non-maskable or maskable interrupt can be selected by IRQ2SEL bit in the CMPA register. For details of the voltage detection circuit, refer to **6. Voltage Detection Circuit** and for details.

#### 11.1.3.5 Single-Step Interrupt, and Address Break Interrupt

Do not use these interrupts. They are provided exclusively for use by development tools.

#### 11.1.3.6 Address Match Interrupt

An address match interrupt is generated immediately before executing an instruction that is stored at an address indicated by registers RMAD0 to RMAD1 if the AIER00 bit in the AIER0 register or the AIER10 bit in the AIER1 register is set to 1 (address match interrupt enabled).

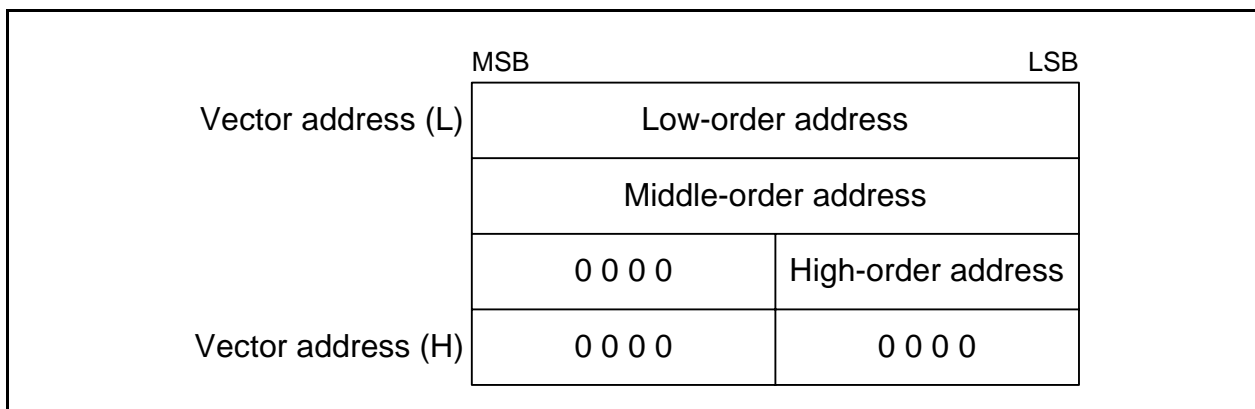

For details of the address match interrupt, refer to **11.7 Address Match Interrupt**.

### 11.1.4 Peripheral Function Interrupts

A peripheral function interrupt is generated by a peripheral function in the MCU. Peripheral function interrupts are maskable. Refer to **Table 11.2 Relocatable Vector Tables** for sources of the corresponding peripheral function interrupt. For details of peripheral functions, refer to the descriptions of individual peripheral functions.

### 11.1.5 Interrupts and Interrupt Vectors

There are 4 bytes in each vector. Set the starting address of an interrupt routine in each interrupt vector. When an interrupt request is acknowledged, the CPU branches to the address set in the corresponding interrupt vector. Figure 11.2 shows an Interrupt Vector.

**Figure 11.2 Interrupt Vector**

#### 11.1.5.1 Fixed Vector Tables

The fixed vector tables are allocated addresses 0FFDCh to 0FFFFh.

Table 11.1 lists the Fixed Vector Tables. The vector addresses (H) of fixed vectors are used by the ID code check function. For details, refer to **25.3 Functions to Prevent Flash Memory from being Rewritten**.

**Table 11.1 Fixed Vector Tables**

Interrupt Source	Vector Addresses Address (L) to (H)	Remarks	Reference
Undefined instruction	0FFDCh to 0FFDFh	Interrupt with UND instruction	R8C/Tiny Series Software Manual
Overflow	0FFE0h to 0FFE3h	Interrupt with INTO instruction	
BRK instruction	0FFE4h to 0FFE7h	If the content of address 0FFE6h is FFh, program execution starts from the address shown by the vector in the relocatable vector table.	
Address match	0FFE8h to 0FFEBh		11.7 Address Match Interrupt
Single step <sup>(1)</sup>	0FFEC h to 0FFEFh		
Watchdog timer, Oscillation stop detection, Voltage monitor 1, Voltage monitor 2	0FFF0h to 0FFF3h		14. Watchdog Timer 9. Clock Generation Circuit 6. Voltage Detection Circuit
Address break <sup>(1)</sup>	0FFF4h to 0FFF7h		
(Reserved)	0FFF8h to 0FFFBh		
Reset	0FFFC h to 0FFFFh		5. Resets

Note:

1. Do not use these interrupts. They are provided exclusively for use by development tools.

### 11.1.5.2 Relocatable Vector Tables

The relocatable vector tables occupy 256 bytes beginning from the starting address set in the INTB register. Table 11.2 lists the Relocatable Vector Tables.

**Table 11.2 Relocatable Vector Tables**

Interrupt Source	Vector Addresses <sup>(1)</sup> Address (L) to Address (H)	Software Interrupt Number	Interrupt Control Register	Reference
BRK instruction <sup>(2)</sup>	+0 to +3 (0000h to 0003h)	0	—	R8C/Tiny Series Software Manual
Flash memory ready	+4 to +7 (0004h to 0007h)	1	FMRDYIC	25. Flash Memory
(Reserved)		2 to 5	—	—
(Reserved)	+24 to +27 (0018h to 001Bh)	6	—	—
Timer RC	+28 to +31 (001Ch to 001Fh)	7	TRCIC	19. Timer RC
(Reserved)	+32 to +35 (0020h to 0023h)	8	—	—
(Reserved)	+36 to +39 (0024h to 0027h)	9	—	—
(Reserved)	+40 to +43 (0028h to 002Bh)	10	—	—
UART2 transmit/NACK2	+44 to +47 (002Ch to 002Fh)	11	S2TIC	21. Serial Interface (UART2)
UART2 receive/ACK2	+48 to +51 (0030h to 0033h)	12	S2RIC	
Key input	+52 to +55 (0034h to 0037h)	13	KUPIC	11.6 Key Input Interrupt
A/D conversion	+56 to +59 (0038h to 003Bh)	14	ADIC	23. A/D Converter
(Reserved)	+60 to +63 (003Ch to 003Fh)	15	—	—
(Reserved)		16	—	—
UART0 transmit	+68 to +71 (0044h to 0047h)	17	S0TIC	20. Serial Interface (UARTi (i = 0 or 1))
UART0 receive	+72 to +75 (0048h to 004Bh)	18	S0RIC	
UART1 transmit	+76 to +79 (004Ch to 004Fh)	19	S1TIC	
UART1 receive	+80 to +83 (0050h to 0053h)	20	S1RIC	
INT2	+84 to +87 (0054h to 0057h)	21	INT2IC	11.4 INT Interrupt
Timer RA	+88 to +91 (0058h to 005Bh)	22	TRAIC	17. Timer RA
(Reserved)		23	—	—

Sensor control unit	+168 to +171 (00A8h to 00ABh)	42	SCUIC	24. Sensor Control Unit
(Reserved)		43 to 49	—	—
Voltage monitor 1	+200 to +203 (00C8h to 00CBh)	50	VCMP1IC	6. Voltage Detection Circuit
Voltage monitor 2	+204 to +207 (00CCh to 00CFh)	51	VCMP2IC	
(Reserved)		52 to 55	—	—
Software <sup>(2)</sup>	+224 to +227 (00E0h to 00E3h) to +252 to +255 (00FCh to 00FFh)	56 to 63	—	R8C/Tiny Series Software Manual

Notes:

1. These addresses are relative to those in the INTB register.
2. These interrupts are not disabled by the I flag.

## 11.2 Registers

### 11.2.1 Interrupt Control Register

**(S2TIC, S2RIC, KUPIC, ADIC, S0TIC, S0RIC, S1TIC, S1RIC, TRAIC, TRBIC, U2BCNIC, SCUIC, VCMP1IC, VCMP2IC)**

Address 004Bh (S2TIC), 004Ch (S2RIC), 004Dh (KUPIC), 004Eh (ADIC),  
0051h (S0TIC), 0052h (S0RIC), 0053h (S1TIC), 0054h (S1RIC),  
0056h (TRAIC), 0058h (TRBIC), 005Eh (U2BCNIC), 006Ah (SCUIC),  
0072h (VCMP1IC), 0073h (VCMP2IC),

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	IR	ILVL2	ILVL1	ILVL0
After Reset	X	X	X	X	X	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	ILVL0	Interrupt priority level select bit	b2 b1 b0 0 0 0: Level 0 (interrupt disabled)	R/W
b1	ILVL1		0 0 1: Level 1	R/W
b2	ILVL2		0 1 0: Level 2	R/W
			0 1 1: Level 3 1 0 0: Level 4 1 0 1: Level 5 1 1 0: Level 6 1 1 1: Level 7	
b3	IR	Interrupt request bit	0: No interrupt requested 1: Interrupt requested	R/W (1)
b4	—	Nothing is assigned. If necessary, set to 0. When read, the content is undefined.		—
b5	—			
b6	—			
b7	—			

Note:

- Only 0 can be written to the IR bit. Do not write 1 to this bit.

Rewrite the interrupt control register when an interrupt request corresponding to the register is not generated.  
Refer to **11.9.5 Rewriting Interrupt Control Register**.

### 11.2.2 Interrupt Control Register (FMRDYIC, TRCIC)

Address 0041h (FMRDYIC), 0047h (TRCIC)

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	IR	ILVL2	ILVL1	ILVL0
After Reset	X	X	X	X	X	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	ILVL0	Interrupt priority level select bit	b2 b1 b0 0 0 0: Level 0 (interrupt disabled) 0 0 1: Level 1 0 1 0: Level 2 0 1 1: Level 3 1 0 0: Level 4 1 0 1: Level 5 1 1 0: Level 6 1 1 1: Level 7	R/W
b1	ILVL1			R/W
b2	ILVL2			R/W
b3	IR	Interrupt request bit	0: No interrupt requested 1: Interrupt requested	R
b4	—	Nothing is assigned. If necessary, set to 0. When read, the content is undefined.		—
b5	—			
b6	—			
b7	—			

Rewrite the interrupt control register when an interrupt request corresponding to the register is not generated.  
Refer to **11.9.5 Rewriting Interrupt Control Register**.

### 11.2.3 INTi Interrupt Control Register (INTiIC) (i = 0 to 3)

Address 0055h (INT2IC), 0059h (INT1IC), 005Ah (INT3IC), 005Dh (INT0IC)

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	POL	IR	ILVL2	ILVL1	ILVL0
After Reset	X	X	0	0	X	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	ILVL0	Interrupt priority level select bit	b2 b1 b0 0 0 0: Level 0 (interrupt disabled) 0 0 1: Level 1 0 1 0: Level 2 0 1 1: Level 3 1 0 0: Level 4 1 0 1: Level 5 1 1 0: Level 6 1 1 1: Level 7	R/W
b1	ILVL1			R/W
b2	ILVL2			R/W
b3	IR	Interrupt request bit	0: No interrupt requested 1: Interrupt requested	R/W (1)
b4	POL	Polarity switch bit <sup>(3)</sup>	0: Falling edge selected 1: Rising edge selected <sup>(2)</sup>	R/W
b5	—	Reserved bit	Set to 0.	R/W
b6	—	Nothing is assigned. If necessary, set to 0. When read, the content is undefined.		—
b7	—			

Notes:

- Only 0 can be written to the IR bit. Do not write 1 to this bit.
- If the INTiPL bit in the INTEN register is set to 1 (both edges), set the POL bit to 0 (falling edge selected).
- The IR bit may be set to 1 (interrupt requested) when the POL bit is rewritten. Refer to **11.9.4 Changing Interrupt Sources**.

Rewrite the interrupt control register when an interrupt request corresponding to the register is not generated. Refer to **11.9.5 Rewriting Interrupt Control Register**.

### 11.3 Interrupt Control

The following describes enabling and disabling maskable interrupts and setting the acknowledgement priority. This description does not apply to non-maskable interrupts.

Use the I flag in the FLG register, IPL, and bits ILVL2 to ILVL0 in the corresponding interrupt control register to enable or disable a maskable interrupt. Whether an interrupt is requested or not is indicated by the IR bit in the corresponding interrupt control register.

#### 11.3.1 I Flag

The I flag enables or disables maskable interrupts. Setting the I flag to 1 (enabled) enables maskable interrupts. Setting the I flag to 0 (disabled) disables all maskable interrupts.

#### 11.3.2 IR Bit

The IR bit is set to 1 (interrupt requested) when an interrupt request is generated. After the interrupt request is acknowledged and the CPU branches to the corresponding interrupt vector, the IR bit is set to 0 (no interrupt requested).

The IR bit can be set to 0 by a program. Do not write 1 to this bit.

However, the IR bit operations of the timer RC interrupt and the flash memory interrupt are different. Refer to **11.8 Timer RC Interrupt and Flash Memory Interrupt (Interrupts with Multiple Interrupt Request Sources)**.

#### 11.3.3 Bits ILVL2 to ILVL0, IPL

Interrupt priority levels can be set using bits ILVL2 to ILVL0.

Table 11.3 lists the Settings of Interrupt Priority Levels and Table 11.4 lists the Interrupt Priority Levels Enabled by IPL.

The following are the conditions when an interrupt is acknowledged:

- I flag = 1
- IR bit = 1
- Interrupt priority level > IPL

The I flag, IR bit, bits ILVL2 to ILVL0, and IPL are independent of each other. They do not affect one another.

**Table 11.3 Settings of Interrupt Priority Levels**

Bits ILVL2 to ILVL0	Interrupt Priority Level	Priority
000b	Level 0 (interrupt disabled)	—
001b	Level 1	<div style="text-align: center;"> Low  ↓  High </div>
010b	Level 2	
011b	Level 3	
100b	Level 4	
101b	Level 5	
110b	Level 6	
111b	Level 7	

**Table 11.4 Interrupt Priority Levels Enabled by IPL**

IPL	Enabled Interrupt Priority Level
000b	Interrupt level 1 and above
001b	Interrupt level 2 and above
010b	Interrupt level 3 and above
011b	Interrupt level 4 and above
100b	Interrupt level 5 and above
101b	Interrupt level 6 and above
110b	Interrupt level 7 and above
111b	All maskable interrupts are disabled

### 11.3.4 Interrupt Sequence

The following describes an interrupt sequence which is performed from when an interrupt request is acknowledged until the interrupt routine is executed.

When an interrupt request is generated while an instruction is being executed, the CPU determines its interrupt priority level after the instruction is completed. The CPU starts the interrupt sequence from the following cycle. However, for the SMOVB, SMOVF, SSTR, or RMPA instruction, if an interrupt request is generated while the instruction is being executed, the MCU suspends the instruction to start the interrupt sequence. The interrupt sequence is performed as indicated below.

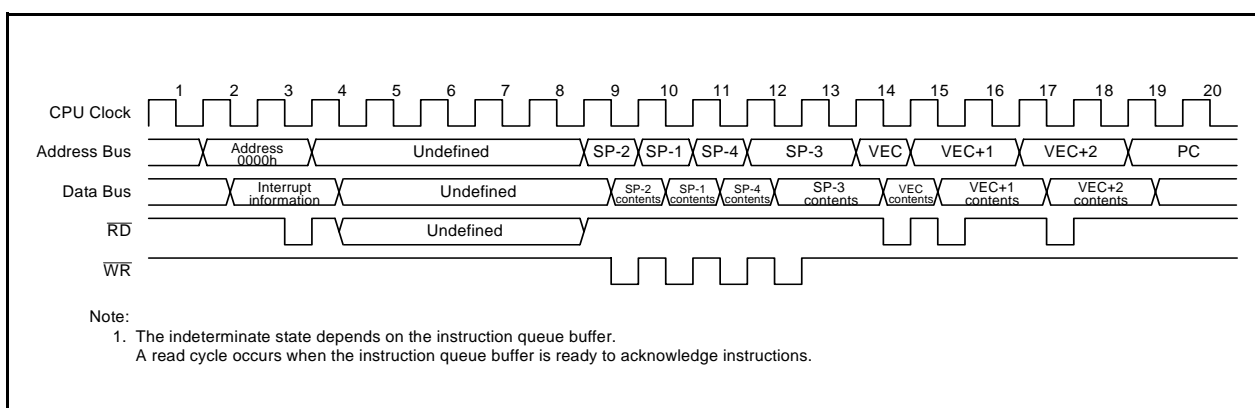

Figure 11.3 shows the Time Required for Executing Interrupt Sequence.

- (1) The CPU obtains interrupt information (interrupt number and interrupt request level) by reading address 00000h. The IR bit for the corresponding interrupt is set to 0 (no interrupt requested). <sup>(2)</sup>
- (2) The FLG register is saved to a temporary register <sup>(1)</sup> in the CPU immediately before entering the interrupt sequence.
- (3) The I, D and U flags in the FLG register are set as follows:  
 The I flag is set to 0 (interrupts disabled).  
 The D flag is set to 0 (single-step interrupt disabled).  
 The U flag is set to 0 (ISP selected).  
 However, the U flag does not change state if an INT instruction for software interrupt number 32 to 63 is executed.
- (4) The CPU internal temporary register <sup>(1)</sup> is saved on the stack.
- (5) The PC is saved on the stack.
- (6) The interrupt priority level of the acknowledged interrupt is set in the IPL.
- (7) The starting address of the interrupt routine set in the interrupt vector is stored in the PC.

After the interrupt sequence is completed, instructions are executed from the starting address of the interrupt routine.

Notes:

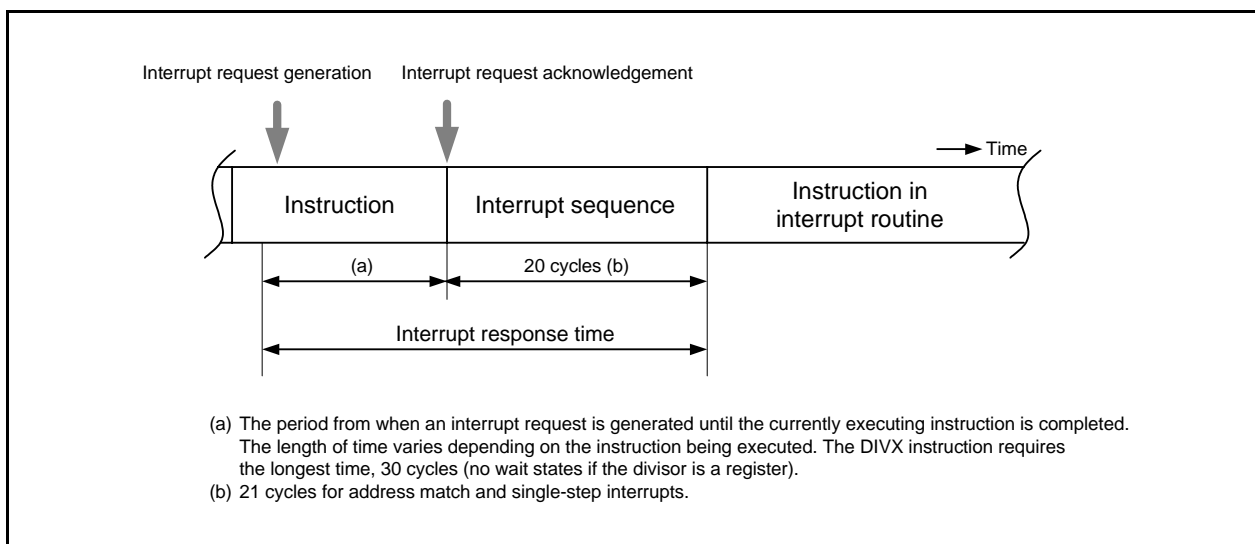

1. These registers cannot be accessed by the user.
2. Refer to **11.8 Timer RC Interrupt and Flash Memory Interrupt (Interrupts with Multiple Interrupt Request Sources)** for the IR bit operations of the timer RC Interrupt.

**Figure 11.3 Time Required for Executing Interrupt Sequence**

### 11.3.5 Interrupt Response Time

Figure 11.4 shows the Interrupt Response Time. The interrupt response time is the period from when an interrupt request is generated until the first instruction in the interrupt routine is executed. The interrupt response time includes the period from when an interrupt request is generated until the currently executing instruction is completed (refer to (a) in Figure 11.4) and the period required for executing the interrupt sequence (20 cycles, refer to (b) in Figure 11.4).

**Figure 11.4** Interrupt Response Time

### 11.3.6 IPL Change when Interrupt Request is Acknowledged

When a maskable interrupt request is acknowledged, the interrupt priority level of the acknowledged interrupt is set in the IPL.

When a software interrupt or special interrupt request is acknowledged, the level listed in Table 11.5 is set in the IPL.

Table 11.5 lists the IPL Value When Software or Special Interrupt is Acknowledged.

**Table 11.5** IPL Value When Software or Special Interrupt is Acknowledged

Interrupt Source without Interrupt Priority Level	Value Set in IPL
Watchdog timer, oscillation stop detection, voltage monitor 1, voltage monitor 2, address break	7
Software, address match, single-step	Not changed

### 11.3.7 Saving Registers

In the interrupt sequence, the FLG register and PC are saved on the stack.

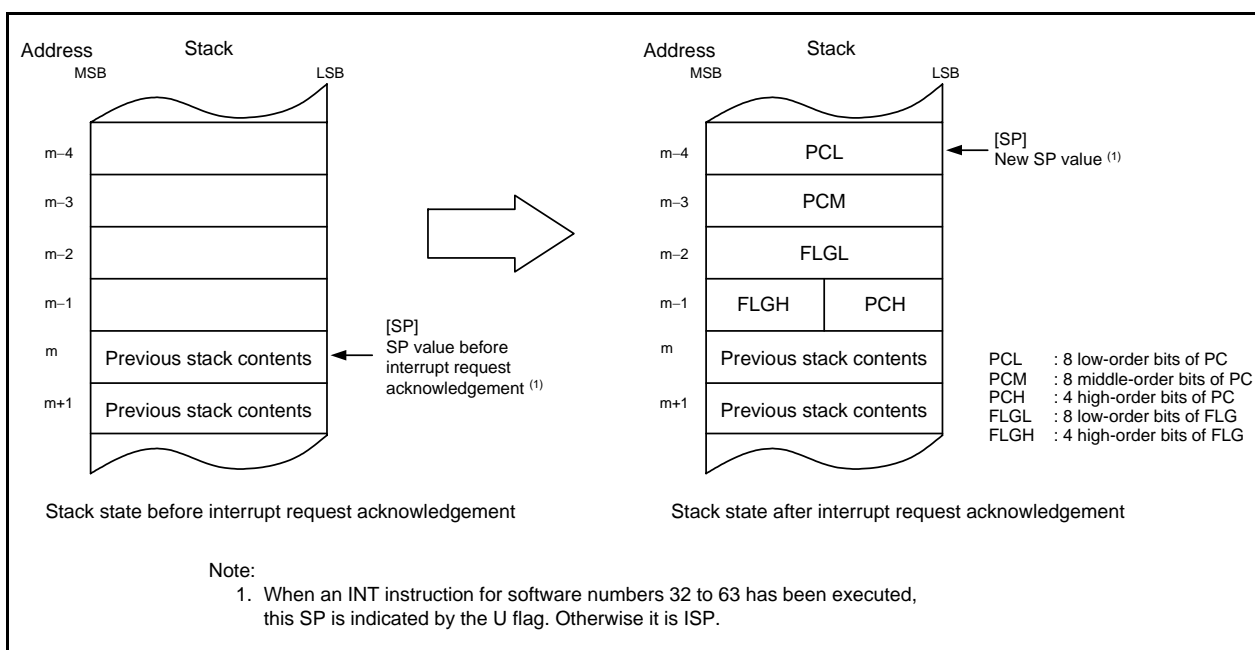

After an extended 16 bits, 4 high-order bits in the PC and 4 high-order (IPL) and 8 low-order bits in the FLG register, are saved on the stack, the 16 low-order bits in the PC are saved.

Figure 11.5 shows the Stack State Before and After Acknowledgement of Interrupt Request.

The other necessary registers should be saved by a program at the beginning of the interrupt routine. The PUSHM instruction can save several registers in the register bank being currently used <sup>(1)</sup> with a single instruction.

Note:

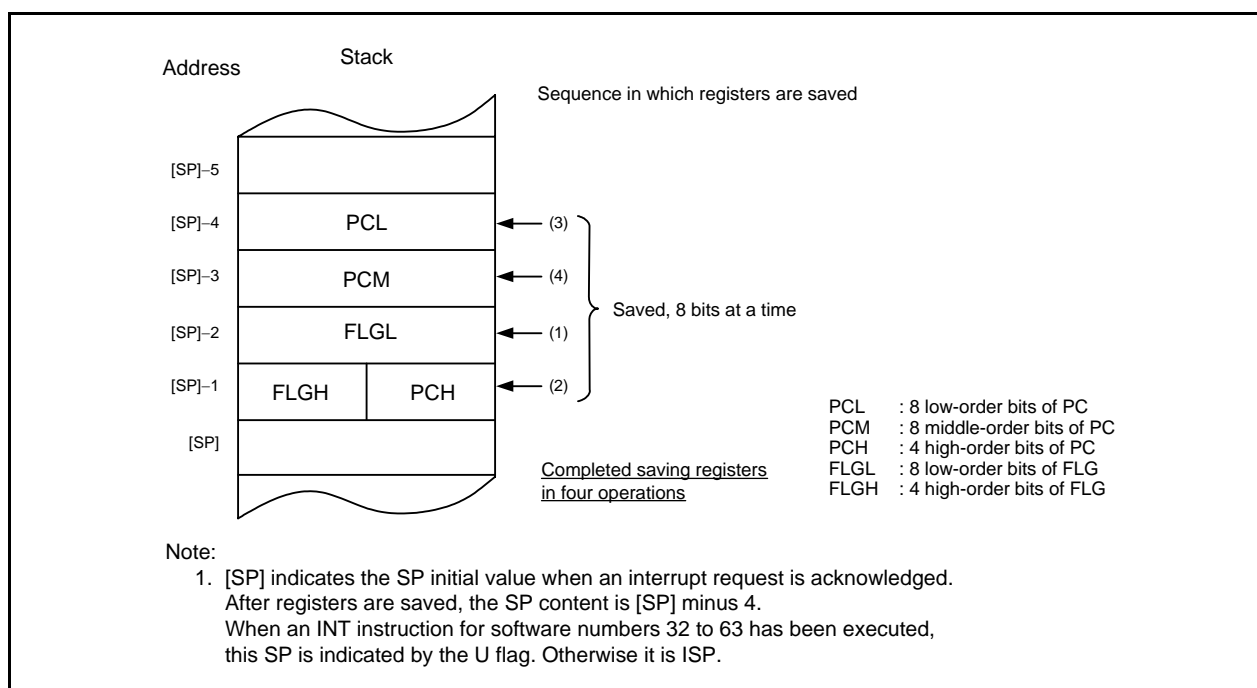

1. Selectable from registers R0, R1, R2, R3, A0, A1, SB, and FB.

**Figure 11.5 Stack State Before and After Acknowledgement of Interrupt Request**

The register saving operation, which is performed as part of the interrupt sequence, saved in 8 bits at a time in four steps.

Figure 11.6 shows the Register Saving Operation.

**Figure 11.6 Register Saving Operation**

### 11.3.8 Returning from Interrupt Routine

When the REIT instruction is executed at the end of an interrupt routine, the FLG register and PC, which have been saved on the stack, are automatically restored. The program, that was running before the interrupt request was acknowledged, starts running again.

Registers saved by a program in an interrupt routine should be saved using the POPM instruction or a similar instruction before executing the REIT instruction.

### 11.3.9 Interrupt Priority

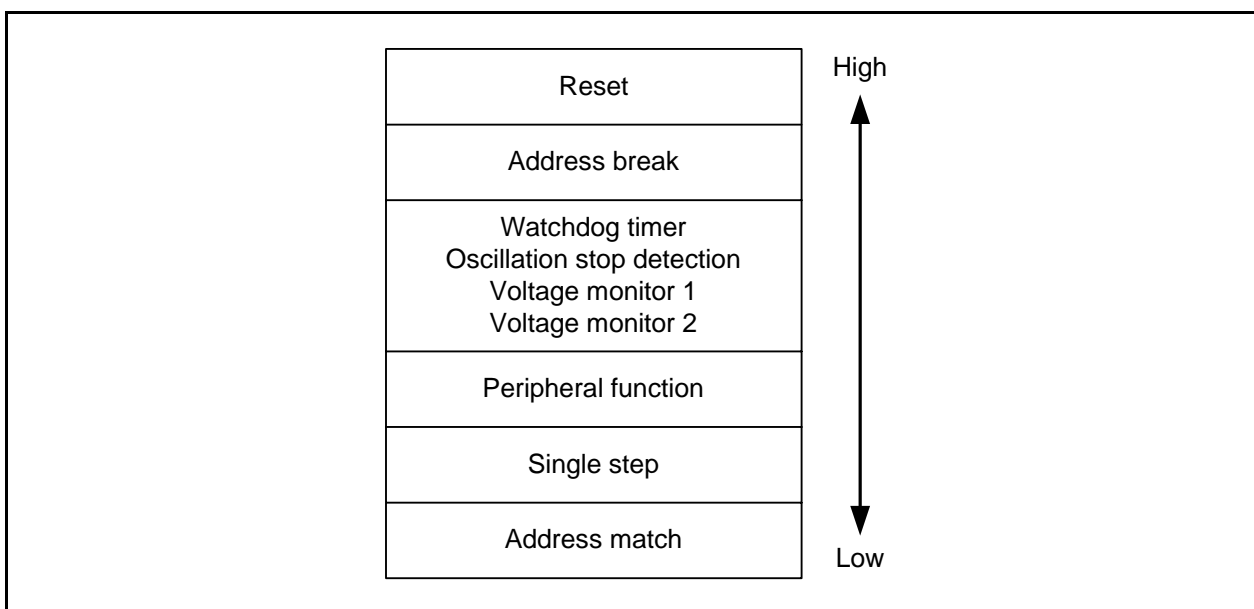

If two or more interrupt requests are generated while a single instruction is being executed, the interrupt with the higher priority is acknowledged.

Set bits ILVL2 to ILVL0 to select any priority level for maskable interrupts (peripheral function). However, if two or more maskable interrupts have the same priority level, their interrupt priority is resolved by hardware, with the higher priority interrupts acknowledged.

The priority of watchdog timer and other special interrupts is set by hardware.

Figure 11.7 shows the Hardware Interrupt Priority.

Software interrupts are not affected by the interrupt priority. If an instruction is executed, the MCU executes the interrupt routine.

**Figure 11.7** Hardware Interrupt Priority

### 11.3.10 Interrupt Priority Level Selection Circuit

The interrupt priority level selection circuit is used to select the highest priority interrupt.

Figure 11.8 shows the Interrupt Priority Level Selection Circuit.

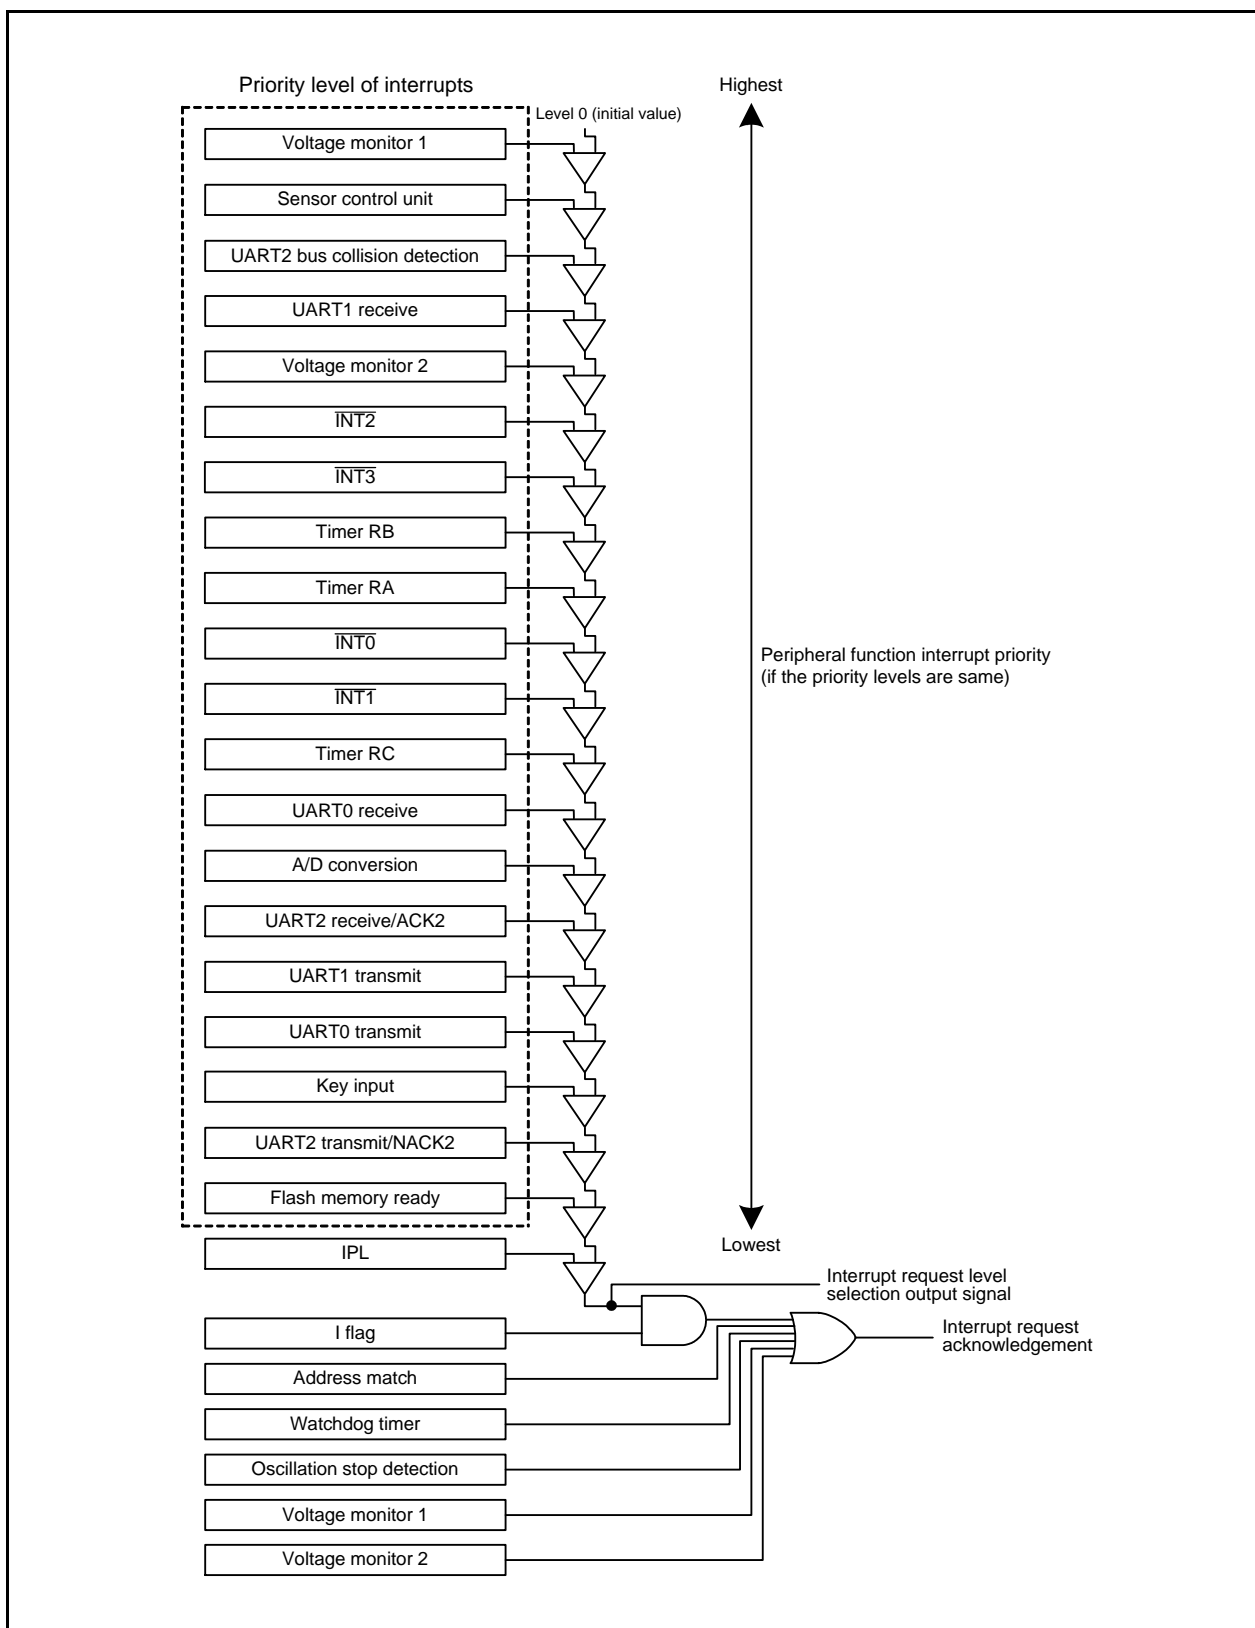

Figure 11.8 Interrupt Priority Level Selection Circuit

## 11.4 $\overline{\text{INT}}$ Interrupt

### 11.4.1 $\overline{\text{INT}}_i$ Interrupt ( $i = 0$ to $3$ )

The  $\overline{\text{INT}}_i$  interrupt is generated by an  $\overline{\text{INT}}_i$  input. To use the  $\overline{\text{INT}}_i$  interrupt, set the  $\text{INT}_i\text{EN}$  bit in the  $\text{INTEN}$  register is to 1 (enabled). The edge polarity is selected using the  $\text{INT}_i\text{PL}$  bit in the  $\text{INTEN}$  register and the  $\text{POL}$  bit in the  $\text{INT}_i\text{IC}$  register. The input pins used as the  $\overline{\text{INT}}_1$  and  $\overline{\text{INT}}_3$  input can be selected.

Also, inputs can be passed through a digital filter with three different sampling clocks.

The  $\overline{\text{INT}}_0$  pin is shared with the pulse output forced cutoff input of timer RC, and the external trigger input of timer RB. The  $\overline{\text{INT}}_2$  pin is shared with the event input enabled of timer RA.

Table 11.6 lists the Pin Configuration of  $\overline{\text{INT}}$  Interrupt.

**Table 11.6 Pin Configuration of  $\overline{\text{INT}}$  Interrupt**

Pin Name	Assigned Pin	I/O	Function
$\overline{\text{INT}}_0$	P4_5	Input	$\overline{\text{INT}}_0$ interrupt input, timer RB external trigger input, timer RC pulse output forced cutoff input
$\overline{\text{INT}}_1$	P1_5, P1_7, P2_0, or P3_5	Input	$\overline{\text{INT}}_1$ interrupt input
$\overline{\text{INT}}_2$	P3_4	Input	$\overline{\text{INT}}_2$ interrupt input, timer RA event input enabled
$\overline{\text{INT}}_3$	P3_3 or P3_7	Input	$\overline{\text{INT}}_3$ interrupt input

### 11.4.2 $\overline{\text{INT}}$ Interrupt Input Pin Select Register (INTSR)

Address 018Eh

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	$\text{INT3SEL0}$	—	—	$\text{INT1SEL2}$	$\text{INT1SEL1}$	$\text{INT1SEL0}$	—
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b1	$\text{INT1SEL0}$	$\overline{\text{INT}}_1$ pin select bit	b3 b2 b1 0 0 0: P1_7 assigned	R/W
b2	$\text{INT1SEL1}$		0 0 1: P1_5 assigned	R/W
b3	$\text{INT1SEL2}$		0 1 0: P2_0 assigned	R/W
			0 1 1: Do not set. 1 0 0: Do not set. 1 0 1: P3_5 assigned Other than above: Do not set.	
b4	—	Reserved bit	Set to 0.	R/W
b5	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b6	$\text{INT3SEL0}$	$\overline{\text{INT}}_3$ pin select bit	0: P3_3 assigned 1: P3_7 assigned	R/W
b7	—	Reserved bit	Set to 0.	R/W

The  $\text{INTSR}$  register selects which pin is assigned to the  $\overline{\text{INT}}_i$  ( $i = 1$  or  $3$ ) input. To use  $\overline{\text{INT}}_i$ , set this register.

Set the  $\text{INTSR}$  register before setting the  $\overline{\text{INT}}_i$  associated registers. Also, do not change the setting values in this register during  $\overline{\text{INT}}_i$  operation.

### 11.4.3 Low-Voltage Signal Mode Control Register (TSMR)

Address 0190h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	I3LVM	I2LVM	I1LVM	I0LVM	U2LVM	U1LVM	U0LVM	LVMPR
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	LVMPR	Low-voltage signal mode protect bit	0: Write disabled 1: Write enabled <sup>(1)</sup>	R/W
b1	U0LVM	UART0 low-voltage signal mode control bit <sup>(1)</sup>	0: Low-voltage signal mode disabled 1: Low-voltage signal mode enabled <sup>(2)</sup>	R/W
b2	U1LVM	UART1 low-voltage signal mode control bit <sup>(1)</sup>		R/W
b3	U2LVM	UART2 low-voltage signal mode control bit <sup>(1)</sup>		R/W
b4	I0LVM	$\overline{\text{INT0}}$ low-voltage signal mode control bit <sup>(1)</sup>	0: Low-voltage signal mode disabled 1: Low-voltage signal mode enabled	R/W
b5	I1LVM	$\overline{\text{INT1}}$ low-voltage signal mode control bit <sup>(1)</sup>		R/W
b6	I2LVM	$\overline{\text{INT2}}$ low-voltage signal mode control bit <sup>(1)</sup>		R/W
b7	I3LVM	$\overline{\text{INT3}}$ low-voltage signal mode control bit <sup>(1)</sup>		R/W

Notes:

1. When the LVMPR bit is set to 1 (write enabled), writing to bits UiLVM (i = 0 to 2) and IjLVM (j = 0 to 3) is enabled. Rewrite bits UiLVM (i = 0 to 2) and IjLVM (j = 0 to 3) after setting the LVMPR bit to 1. When writing 1 to the LVMPR bit, write 0 and then 1 continuously.
2. When the UiLVM (i = 0 to 2) bit is set to 1, the TxDi pin is set to N-channel open-drain output regardless of the setting of the NCH bit in the UiC0 (i = 0 to 2) register.

### 11.4.4 External Input Enable Register 0 (INTEN)

Address 01FAh

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	INT3PL	INT3EN	INT2PL	INT2EN	INT1PL	INT1EN	INT0PL	INT0EN
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	INT0EN	$\overline{\text{INT0}}$ input enable bit	0: Disabled 1: Enabled	R/W
b1	INT0PL	$\overline{\text{INT0}}$ input polarity select bit (1, 2)	0: One edge 1: Both edges	R/W
b2	INT1EN	$\overline{\text{INT1}}$ input enable bit	0: Disabled 1: Enabled	R/W
b3	INT1PL	$\overline{\text{INT1}}$ input polarity select bit (1, 2)	0: One edge 1: Both edges	R/W
b4	INT2EN	$\overline{\text{INT2}}$ input enable bit	0: Disabled 1: Enabled	R/W
b5	INT2PL	$\overline{\text{INT2}}$ input polarity select bit (1, 2)	0: One edge 1: Both edges	R/W
b6	INT3EN	$\overline{\text{INT3}}$ input enable bit	0: Disabled 1: Enabled	R/W
b7	INT3PL	$\overline{\text{INT3}}$ input polarity select bit (1, 2)	0: One edge 1: Both edges	R/W

Notes:

1. To set the INTiPL bit (i = 0 to 3) to 1 (both edges), set the POL bit in the INTiIC register to 0 (falling edge selected).
2. The IR bit in the INTiIC register may be set to 1 (interrupt requested) if the INTEN register is rewritten. Refer to **11.9.4 Changing Interrupt Sources**.

### 11.4.5 INT Input Filter Select Register 0 (INTF)

Address 01FCh

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	INT3F1	INT3F0	INT2F1	INT2F0	INT1F1	INT1F0	INT0F1	INT0F0
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	INT0F0	$\overline{\text{INT0}}$ input filter select bit	b1 b0 0 0: No filter 0 1: Filter with f1 sampling 1 0: Filter with f8 sampling 1 1: Filter with f32 sampling	R/W
b1	INT0F1			R/W
b2	INT1F0	$\overline{\text{INT1}}$ input filter select bit	b3 b2 0 0: No filter 0 1: Filter with f1 sampling 1 0: Filter with f8 sampling 1 1: Filter with f32 sampling	R/W
b3	INT1F1			R/W
b4	INT2F0	$\overline{\text{INT2}}$ input filter select bit	b5 b4 0 0: No filter 0 1: Filter with f1 sampling 1 0: Filter with f8 sampling 1 1: Filter with f32 sampling	R/W
b5	INT2F1			R/W
b6	INT3F0	$\overline{\text{INT3}}$ input filter select bit	b7 b6 0 0: No filter 0 1: Filter with f1 sampling 1 0: Filter with f8 sampling 1 1: Filter with f32 sampling	R/W
b7	INT3F1			R/W

### 11.4.6 $\overline{\text{INTi}}$ Input Filter (i = 0 to 3)

The  $\overline{\text{INTi}}$  input contains a digital filter. The sampling clock is selected using bits  $\text{INTiF1}$  and  $\text{INTiF0}$  in the  $\text{INTF}$  register. The  $\overline{\text{INTi}}$  level is sampled every sampling clock cycle and if the sampled input level matches three times, the IR bit in the  $\text{INTiC}$  register is set to 1 (interrupt requested).

Figure 11.9 shows the  $\overline{\text{INTi}}$  Input Filter Configuration. Figure 11.10 shows an Operating Example of  $\overline{\text{INTi}}$  Input Filter.

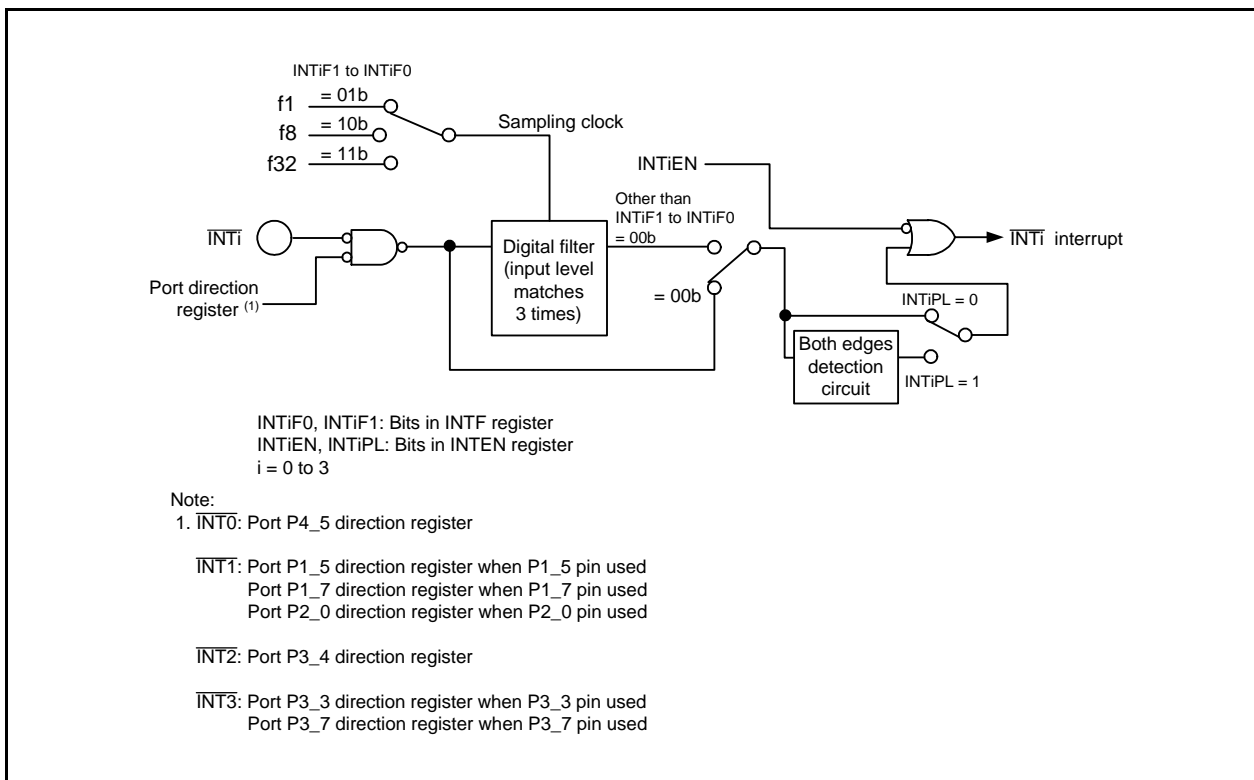

Figure 11.9  $\overline{\text{INTi}}$  Input Filter Configuration

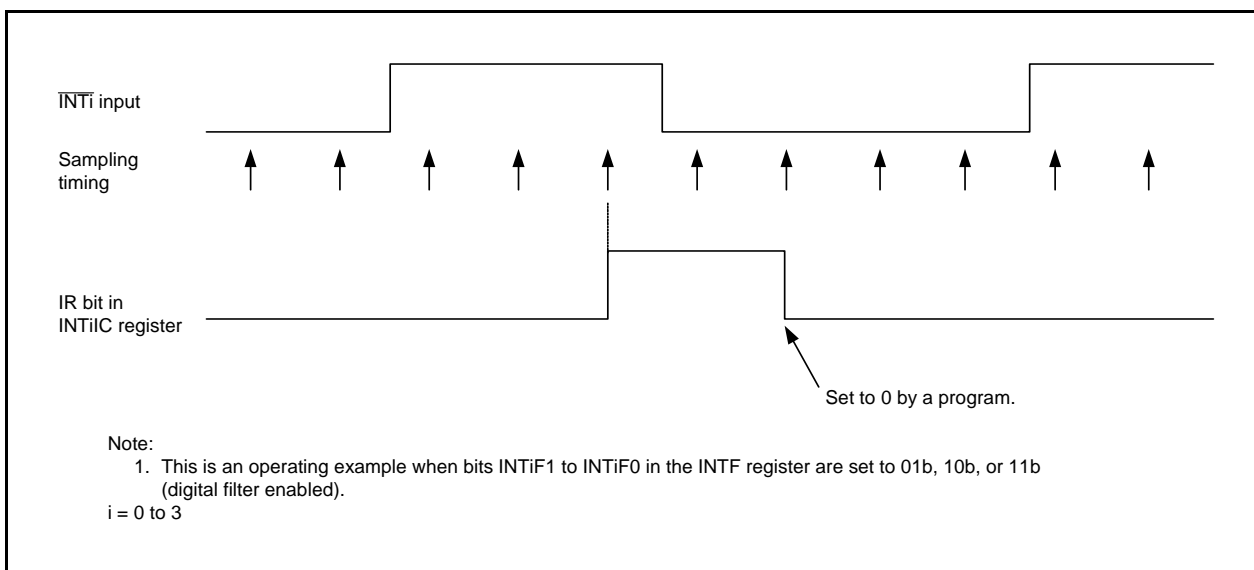

Figure 11.10 Operating Example of  $\overline{\text{INTi}}$  Input Filter

## 11.5 Low-Voltage Signal Mode

Serial interface (UART0 to UART2) communication and the  $\overline{\text{INT}}$  input for the  $\overline{\text{INT}}$  interrupt can be performed using a low-voltage signal. Table 11.7 lists the Pins Usable for Inputting and Outputting Low-Voltage Signal.

Depending on the setting of the TSMR register, the pins enabled for low-voltage signal mode is switched from schmitt input to CMOS input when they are used as input.

Set the input threshold values for CMOS input using registers VLT0 and VLT1.

When low-voltage signal mode is used, all inputs are set to CMOS input. Since schmitt input is disabled, always take countermeasures against noise.

**Table 11.7 Pins Usable for Inputting and Outputting Low-Voltage Signal**

Peripheral Function Name		Pin
Serial interface	UART0 Clock synchronous serial I/O Clock asynchronous serial I/O	CLK0, RXD0, TXD0
	UART1 Clock synchronous serial I/O Clock asynchronous serial I/O	CLK1, RXD1, TXD1
	UART2 Clock synchronous serial I/O Clock asynchronous serial I/O Special mode 1 (I <sup>2</sup> C mode) Special mode 2 (SSU mode) Multiprocessor communication function	CLK2, RXD2, TXD2, CTS2, RTS2, SCL2, SDA2
$\overline{\text{INT}}$	$\overline{\text{INT0}}$ to $\overline{\text{INT3}}$	$\overline{\text{INT0}}$ to $\overline{\text{INT3}}$

## 11.6 Key Input Interrupt

A key input interrupt request is generated by one of the input edges of pins  $\overline{KI0}$  to  $\overline{KI3}$ . The key input interrupt can be used as a key-on wake-up function to exit wait or stop mode.

The  $KIiEN$  ( $i = 0$  to  $3$ ) bit in the  $KIEN$  register is used to select whether or not the pins are used as the  $\overline{KIi}$  input. The  $KIiPL$  bit in the  $KIEN$  register is also used to select the input polarity.

When inputting “L” to the  $\overline{KIi}$  pin, which sets the  $KIiPL$  bit to 0 (falling edge), the input to the other pins  $\overline{KI0}$  to  $\overline{KI3}$  is not detected as interrupts. When inputting “H” to the  $\overline{KIi}$  pin, which sets the  $KIiPL$  bit to 1 (rising edge), the input to the other pins  $\overline{KI0}$  to  $\overline{KI3}$  is not also detected as interrupts.

Figure 11.11 shows a Block Diagram of Key Input Interrupt. Table 11.8 lists the Pin Configuration of Key Input Interrupt.

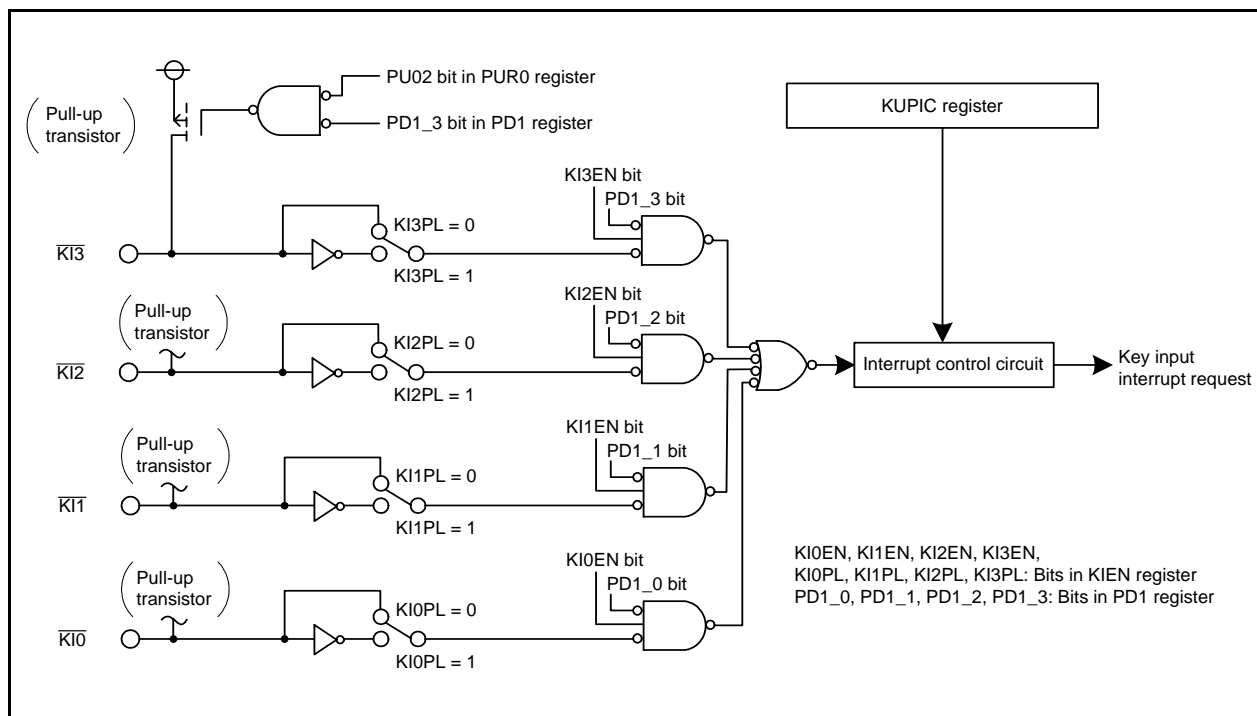

Figure 11.11 Block Diagram of Key Input Interrupt

Table 11.8 Pin Configuration of Key Input Interrupt

Pin Name	I/O	Function
$\overline{KI0}$	Input	$\overline{KI0}$ interrupt input
$\overline{KI1}$	Input	$\overline{KI1}$ interrupt input
$\overline{KI2}$	Input	$\overline{KI2}$ interrupt input
$\overline{KI3}$	Input	$\overline{KI3}$ interrupt input

### 11.6.1 Key Input Enable Register 0 (KIEN)

Address 01FEh

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	KI3PL	KI3EN	KI2PL	KI2EN	KI1PL	KI1EN	KI0PL	KI0EN
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	KI0EN	KI0 input enable bit	0: Disabled 1: Enabled	R/W
b1	KI0PL	KI0 input polarity select bit	0: Falling edge 1: Rising edge	R/W
b2	KI1EN	KI1 input enable bit	0: Disabled 1: Enabled	R/W
b3	KI1PL	KI1 input polarity select bit	0: Falling edge 1: Rising edge	R/W
b4	KI2EN	KI2 input enable bit	0: Disabled 1: Enabled	R/W
b5	KI2PL	KI2 input polarity select bit	0: Falling edge 1: Rising edge	R/W
b6	KI3EN	KI3 input enable bit	0: Disabled 1: Enabled	R/W
b7	KI3PL	KI3 input polarity select bit	0: Falling edge 1: Rising edge	R/W

The IR bit in the KUPIC register may be set to 1 (interrupt requested) when the KIEN register is rewritten.  
Refer to **11.9.4 Changing Interrupt Sources**.

## 11.7 Address Match Interrupt

An address match interrupt request is generated immediately before execution of the instruction at the address indicated by the RMADi register (i = 0 or 1). This interrupt is used as a break function by the debugger. When the on-chip debugger is used, do not set an address match interrupt (registers AIER0, AIER1, RMAD0, and RMAD1, and fixed vector tables) in the user system.

Set the starting address of any instruction in the RMADi register (i = 0 or 1). The AIERi0 bit in the AIERi register can be used to select enable or disable the interrupt. The address match interrupt is not affected by the I flag and IPL.

The PC value (refer to **11.3.7 Saving Registers**) which is saved on the stack when an address match interrupt request is acknowledged varies depending on the instruction at the address indicated by the RMADi register. (The appropriate return address is not saved on the stack.) When returning from the address match interrupt, follow one of the following means:

- Rewrite the contents of the stack and use the REIT instruction to return.
- Use an instruction such as POP to restore the stack to its previous state before the interrupt request was acknowledged. Then use a jump instruction to return.

Table 11.9 lists the PC Value Saved on Stack When Address Match Interrupt Request is Acknowledged and Table 11.10 lists the Correspondence Between Address Match Interrupt Sources and Associated Registers.

**Table 11.9 PC Value Saved on Stack When Address Match Interrupt Request is Acknowledged**

Address Indicated by RMADi Register (i = 0 or 1)	PC Value Saved (1)
<ul style="list-style-type: none"> <li>• Instruction with 2-byte operation code (2)</li> <li>• Instruction with 1-byte operation code (2)</li> </ul> <div> ADD.B:S    #IMM8,dest    SUB.B:S    #IMM8,dest    AND.B:S    #IMM8,dest  OR.B:S    #IMM8,dest    MOV.B:S    #IMM8,dest    STZ        #IMM8,dest  STNZ       #IMM8,dest    STZX       #IMM81,#IMM82,dest  CMP.B:S    #IMM8,dest    PUSHM    src            POPM       dest  JMPS       #IMM8       JSRS       #IMM8  MOV.B:S    #IMM,dest (however, dest = A0 or A1) </div>	Address indicated by RMADi register + 2
<ul style="list-style-type: none"> <li>• Instructions other than above</li> </ul>	Address indicated by RMADi register + 1

Notes:

1. Refer to the **11.3.7 Saving Registers**.
2. Operation code: Refer to the **R8C/Tiny Series Software Manual** (REJ09B0001).

**Chapter 4. Instruction Code/Number of Cycles** contains diagrams showing operation code below each syntax. Operation code is shown in the bold frame in the diagrams.

**Table 11.10 Correspondence Between Address Match Interrupt Sources and Associated Registers**

Address Match Interrupt Source	Address Match Interrupt Enable Bit	Address Match Interrupt Register

## 11.8 Timer RC Interrupt and Flash Memory Interrupt (Interrupts with Multiple Interrupt Request Sources)

The timer RC interrupt and flash memory interrupt each have multiple interrupt request sources. An interrupt request is generated by the logical OR of several interrupt request sources and is reflected in the IR bit in the corresponding interrupt control register. Therefore, each of these peripheral functions has its own interrupt request source status register (status register) and interrupt request source enable register (enable register) to control the generation of interrupt requests (change of the IR bit in the interrupt control register). Table 11.11 lists the Registers Associated with Timer RC Interrupt and Flash Memory Interrupt.

**Table 11.11 Registers Associated with Timer RC Interrupt and Flash Memory Interrupt**

Peripheral Function Name	Status Register of Interrupt Request Source	Enable Register of Interrupt Request Source	Interrupt Control Register
Timer RC	TRCSR	TRCIE	TRCIC
Flash memory	RDYSTI	RDYSTIE	FMRDYIC
	BSYAEI	BSYAEIE	
		CMDEIE	

As with other maskable interrupts, the timer RC interrupt and flash memory interrupt are controlled by the combination of the I flag, IR bit, bits ILVL0 to ILVL2, and IPL. However, since each interrupt source is generated by a combination of multiple interrupt request sources, the following differences from other maskable interrupts apply:

- When bits in the enable register are set to 1 and the corresponding bits in the status register are set to 1 (interrupt enabled), the IR bit in the interrupt control register is set to 1 (interrupt requested).
- When either bits in the status register or the corresponding bits in the enable register, or both are set to 0, the IR bit is set to 0 (no interrupt requested).

That is, even if the interrupt is not acknowledged after the IR bit is set to 1, the interrupt request will not be retained.

Also, the IR bit is not set to 0 even if 0 is written to this bit.

- Individual bits in the status register are not automatically set to 0 even if the interrupt is acknowledged.

The IR bit is also not automatically set to 0 when the interrupt is acknowledged.

Set individual bits in the status register to 0 in the interrupt routine. Refer to the status register figure for how to set individual bits in the status register to 0.

- When multiple bits in the enable register are set to 1 and other request sources are generated after the IR bit is set to 1, the IR bit remains 1.
- When multiple bits in the enable register are set to 1, use the status register to determine which request source causes an interrupt.

Refer to chapters of the individual peripheral functions (**19. Timer RC** and **25. Flash Memory**) for the status register and enable register.

For the interrupt control register, refer to **11.3 Interrupt Control**.

## 11.9 Notes on Interrupts

### 11.9.1 Reading Address 00000h

Do not read address 00000h by a program. When a maskable interrupt request is acknowledged, the CPU reads interrupt information (interrupt number and interrupt request level) from 00000h in the interrupt sequence. At this time, the IR bit for the acknowledged interrupt is set to 0.

If address 00000h is read by a program, the IR bit for the interrupt which has the highest priority among the enabled interrupts is set to 0. This may cause the interrupt to be canceled, or an unexpected interrupt to be generated.

### 11.9.2 SP Setting

Set a value in the SP before an interrupt is acknowledged. The SP is set to 0000h after a reset. If an interrupt is acknowledged before setting a value in the SP, the program may run out of control.

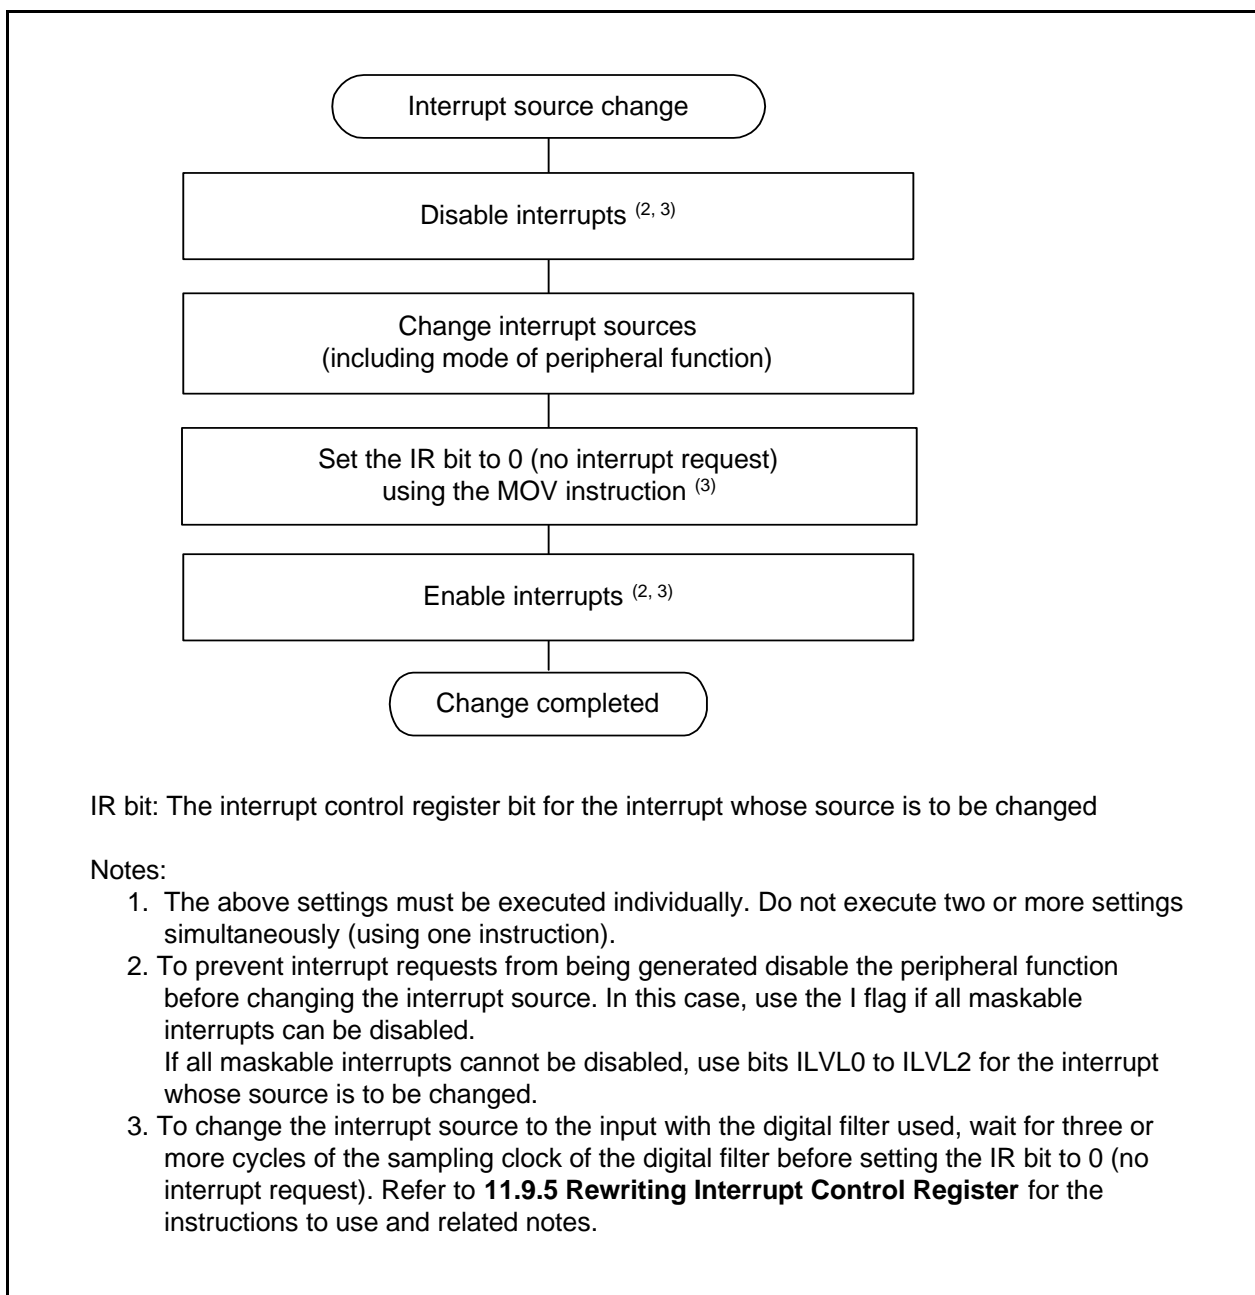

### 11.9.3 External Interrupt and Key Input Interrupt

Either the “L” level width or “H” level width shown in the Electrical Characteristics is required for the signal input to pins  $\overline{\text{INT0}}$  to  $\overline{\text{INT3}}$  and pins  $\overline{\text{KI0}}$  to  $\overline{\text{KI3}}$ , regardless of the CPU clock.

For details, refer to **Table 27.18** (VCC = 5 V), **Table 27.24** (VCC = 3 V), **Table 27.30** (VCC = 2.2 V) **External Interrupt INTi (i = 0 to 3) Input, Key Input Interrupt KIi (i = 0 to 3).**

### 11.9.4 Changing Interrupt Sources

The IR bit in the interrupt control register may be set to 1 (interrupt requested) when the interrupt source changes. To use an interrupt, set the IR bit to 0 (no interrupt requested) after changing interrupt sources. Changing interrupt sources as referred to here includes all factors that change the source, polarity, or timing of the interrupt assigned to a software interrupt number. Therefore, if a mode change of a peripheral function involves the source, polarity, or timing of an interrupt, set the IR bit to 0 (no interrupt requested) after making these changes. Refer to the descriptions of the individual peripheral functions for related interrupts. Figure 11.12 shows a Procedure Example for Changing Interrupt Sources.

**Figure 11.12 Procedure Example for Changing Interrupt Sources**

### 11.9.5 Rewriting Interrupt Control Register

- (a) The contents of the interrupt control register can be rewritten only while no interrupt requests corresponding to that register are generated. If an interrupt request may be generated, disable the interrupt before rewriting the contents of the interrupt control register.
- (b) When rewriting the contents of the interrupt control register after disabling the interrupt, be careful to choose appropriate instructions.

#### Changing any bit other than the IR bit

If an interrupt request corresponding to the register is generated while executing the instruction, the IR bit may not be set to 1 (interrupt requested), and the interrupt may be ignored. If this causes a problem, use one of the following instructions to rewrite the contents of the register: AND, OR, BCLR, and BSET.

#### Changing the IR bit

Depending on the instruction used, the IR bit may not be set to 0 (no interrupt requested).  
Use the MOV instruction to set the IR bit to 0.

- (c) When using the I flag to disable an interrupt, set the I flag as shown in the sample programs below. Refer to (b) regarding rewriting the contents of interrupt control registers using the sample programs.

Examples 1 to 3 shows how to prevent the I flag from being set to 1 (interrupts enabled) before the contents of the interrupt control register are rewritten for the effects of the internal bus and the instruction queue buffer.

#### Example 1: Use the NOP instructions to pause program until the interrupt control register is rewritten

```
INT_SWITCH1:
    FCLR    I                ; Disable interrupts
    AND.B   #00H, 0056H     ; Set the TRAIC register to 00h
    NOP
    NOP
    FSET    I                ; Enable interrupts
```

#### Example 2: Use a dummy read to delay the FSET instruction

```
INT_SWITCH2:
    FCLR    I                ; Disable interrupts
    AND.B   #00H, 0056H     ; Set the TRAIC register to 00h
    MOV.W   MEM,R0          ; Dummy read
    FSET    I                ; Enable interrupts
```

#### Example 3: Use the POPC instruction to change the I flag

```
INT_SWITCH3:
    PUSHC   FLG
    FCLR    I                ; Disable interrupts
    AND.B   #00H, 0056H     ; Set the TRAIC register to 00h
    POPC    FLG             ; Enable interrupts
```

## 12. ID Code Areas

The ID code areas are used to implement a function that prevents the flash memory from being rewritten in standard serial I/O mode. This function prevents the flash memory from being read, rewritten, or erased.

### 12.1 Overview

The ID code areas are assigned to 0FFDFh, 0FFE3h, 0FFEBh, 0FFEfH, 0FFF3h, 0FFF7h, and 0FFFBh of the respective vector highest-order addresses of the fixed vector table. Figure 12.1 shows the ID Code Areas.

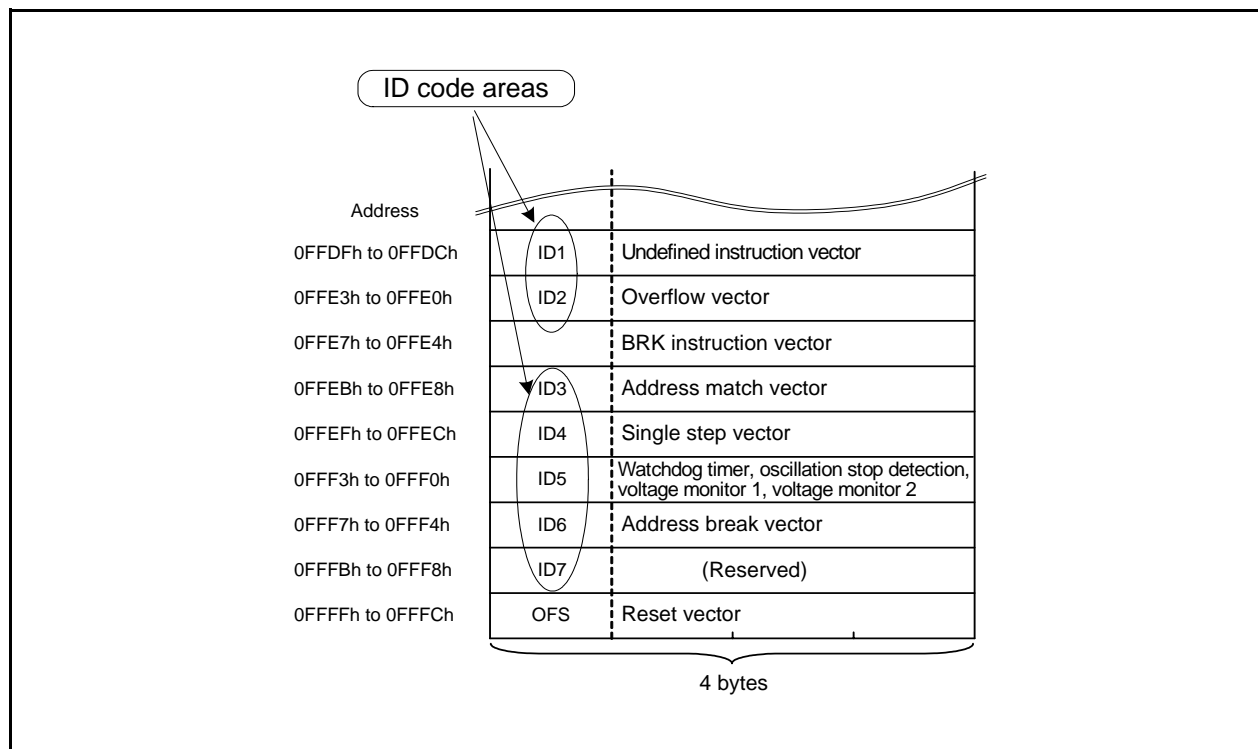

Figure 12.1 ID Code Areas

## 12.2 Functions

The ID code areas are used in standard serial I/O mode. Unless 3 bytes (addresses 0FFFCh to 0FFFEh) of the reset vector are set to FFFFFFFh, the ID codes stored in the ID code areas and the ID codes sent from the serial programmer or the on-chip debugging emulator are checked to see if they match. If the ID codes match, the commands sent from the serial programmer or the on-chip debugging emulator are acknowledged. If the ID codes do not match, the commands are not acknowledged. To use the serial programmer or the on-chip debugging emulator, first write predetermined ID codes to the ID code areas.

If 3 bytes (addresses 0FFFCh to 0FFFEh) of the reset vector are set to FFFFFFFh, the ID codes are not checked and all commands are accepted.

The ID code areas are allocated in the flash memory, not in the SFRs. Set appropriate values as ROM data by a program.

The character sequence of the ASCII codes "ALeRASE" is the reserved word used for the forced erase function. The character sequence of the ASCII codes "Protect" is the reserved word used for the standard serial I/O mode disabled function. Table 12.1 lists the ID Code Reserved Word. The reserved word is a set of reserved characters when all the addresses and data in the ID code storage addresses sequentially match Table 12.1. When the forced erase function or standard serial I/O mode disabled function is not used, use another character sequence of the ASCII codes.

**Table 12.1 ID Code Reserved Word**

ID Code Storage Address		ID Code Reserved Word (ASCII) <sup>(1)</sup>	
		ALeRASE	Protect
0FFDFh	ID1	41h (upper-case "A")	50h (upper-case "P")
0FFE3h	ID2	4Ch (upper-case "L")	72h (lower-case "r")
0FFEBh	ID3	65h (lower-case "e")	6Fh (lower-case "o")
0FFEfH	ID4	52h (upper-case "R")	74h (lower-case "t")
0FFF3h	ID5	41h (upper-case "A")	65h (lower-case "e")
0FFF7h	ID6	53h (upper-case "S")	63h (lower-case "c")
0FFFBh	ID7	45h (upper-case "E")	74h (lower-case "t")

Note:

1. Reserve word: A set of characters when all the addresses and data in the ID code storage addresses sequentially match Table 12.1.

### 12.3 Forced Erase Function

This function is used in standard serial I/O mode. When the ID codes sent from the serial programmer or the on-chip debugging emulator are “ALeRASE” in ASCII code, the content of the user ROM area will be erased at once. However, if the contents of the ID code addresses are set to other than “ALeRASE” (other than **Table 12.1 ID Code Reserved Word**) when the ROMCR bit in the OFS register is set to 1 and the ROMCP1 bit is set to 0 (ROM code protect enabled), forced erasure is not executed and the ID codes are checked with the ID code check function. Table 12.2 lists the Conditions and Operations of Forced Erase Function.

Also, when the contents of the ID code addresses are set to “ALeRASE” in ASCII code, if the ID codes sent from the serial programmer or the on-chip debugging emulator are “ALeRASE”, the content of the user ROM area will be erased. If the ID codes sent from the serial programmer are other than “ALeRASE”, the ID codes do not match and no command is acknowledged, thus the user ROM area remains protected.

**Table 12.2 Conditions and Operations of Forced Erase Function**

Condition			Operation
ID code from serial programmer or the on-chip debugging emulator	ID code in ID code storage address	Bits ROMCP1 and ROMCR in OFS register	
ALeRASE	ALeRASE	—	All erasure of user ROM area (forced erase function)
	Other than ALeRASE <sup>(1)</sup>	Other than 01b (ROM code protect disabled)	
		01b (ROM code protect enabled)	ID code check (ID code check function)
Other than ALeRASE	ALeRASE	—	ID code check (ID code check function. No ID code match.)
	Other than ALeRASE <sup>(1)</sup>	—	ID code check (ID code check function)

Note:

1. For “Protect”, refer to **12.4 Standard Serial I/O Mode Disabled Function**.

### 12.4 Standard Serial I/O Mode Disabled Function

This function is used in standard serial I/O mode. When the I/D codes in the ID code storage addresses are set to the reserved character sequence of the ASCII codes “Protect” (refer to **Table 12.1 ID Code Reserved Word**), communication with the serial programmer or the on-chip debugging emulator is not performed. This does not allow the flash memory to be read, rewritten, or erased using the serial programmer or the on-chip debugging emulator.

Also, if the ID codes are also set to the reserved character sequence of the ASCII codes “Protect” when the ROMCR bit in the OFS register is set to 1 and the ROMCP1 bit is set to 0 (ROM code protect enabled), ROM code protection cannot be disabled using the serial programmer or the on-chip debugging emulator. This prevents the flash memory from being read, rewritten, or erased using the serial programmer, the on-chip debugging emulator, or parallel programmer.

## 12.5 Notes on ID Code Areas

### 12.5.1 Setting Example of ID Code Areas

The ID code areas are allocated in the flash memory, not in the SFRs. Set appropriate values as ROM data by a program. The following shows a setting example.

- To set 55h in all of the ID code areas

```
.org 00FFDCH
.lword dummy | (55000000h) ; UND
.lword dummy | (55000000h) ; INTO
.lword dummy; BREAK
.lword dummy | (55000000h) ; ADDRESS MATCH
.lword dummy | (55000000h) ; SET SINGLE STEP
.lword dummy | (55000000h) ; WDT
.lword dummy | (55000000h) ; ADDRESS BREAK
.lword dummy | (55000000h) ; RESERVE
```

(Programming formats vary depending on the compiler. Check the compiler manual.)

## 13. Option Function Select Area

### 13.1 Overview

The option function select area is used to select the MCU state after a reset, the function to prevent rewriting in parallel I/O mode, or the watchdog timer operation. The reset vector highest-order-address, 0FFFFh and 0FFDBh, are assigned as the option function select area. Figure 13.1 shows the Option Function Select Area.

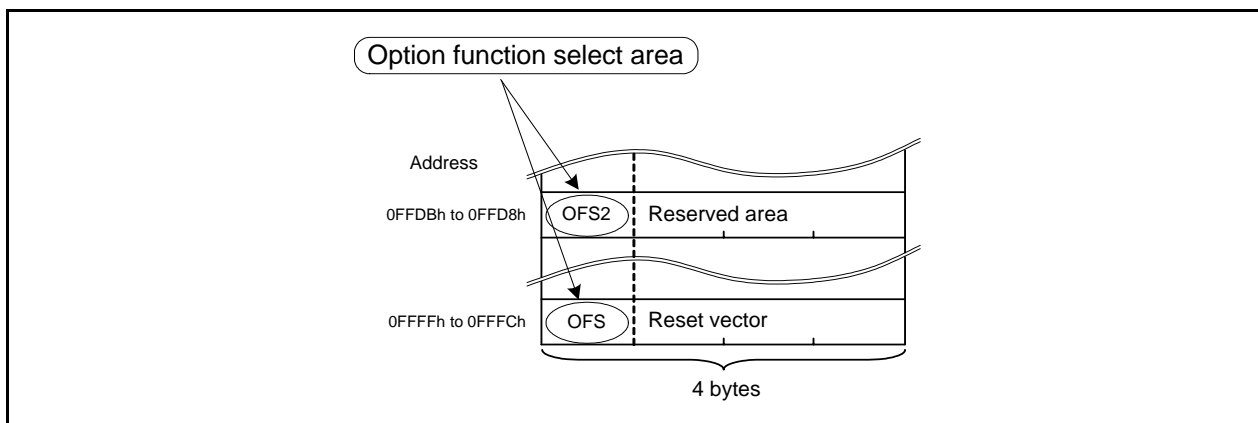

Figure 13.1 Option Function Select Area

## 13.2 Registers

Registers OFS and OFS2 are used to select the MCU state after a reset, the function to prevent rewriting in parallel I/O mode, or the watchdog timer operation.

### 13.2.1 Option Function Select Register (OFS)

Address 0FFFFh

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	CSPROINI	LVDAS	VDSEL1	VDSEL0	ROMCP1	ROMCR	—	WDTON
After Reset	User Setting Value <sup>(1)</sup>							

Bit	Symbol	Bit Name	Function	R/W
b0	WDTON	Watchdog timer start select bit	0: Watchdog timer automatically starts after reset. 1: Watchdog timer is stopped after reset.	R/W
b1	—	Reserved bit	Set to 1.	R/W
b2	ROMCR	ROM code protect disable bit	0: ROM code protect disabled 1: ROMCP1 bit enabled	R/W
b3	ROMCP1	ROM code protect bit	0: ROM code protect enabled 1: ROM code protect disabled	R/W
b4	VDSEL0	Voltage detection 0 level select bit <sup>(2)</sup>	b5 b4 0 0: 3.80 V selected (Vdet0_3) 0 1: 2.85 V selected (Vdet0_2) 1 0: 2.35 V selected (Vdet0_1) 1 1: 1.90 V selected (Vdet0_0)	R/W
b5	VDSEL1			R/W
b6	LVDAS	Voltage detection 0 circuit start bit <sup>(3)</sup>	0: Voltage monitor 0 reset enabled after reset 1: Voltage monitor 0 reset disabled after reset	R/W
b7	CSPROINI	Count source protection mode after reset select bit	0: Count source protect mode enabled after reset 1: Count source protect mode disabled after reset	R/W

Notes:

- The OFS register is allocated in the flash memory, not in the SFRs. Set appropriate values as ROM data by a program.  
Do not write additions to the OFS register. If the block including the OFS register is erased, the OFS register is set to FFh.  
When blank products are shipped, the OFS register is set to FFh. It is set to the written value after written by the user.  
When factory-programming products are shipped, the value of the OFS register is the value programmed by the user.
- The same level of the voltage detection 0 level selected by bits VDSEL0 and VDSEL1 is set in both functions of voltage monitor 0 reset and power-on reset.
- To use power-on reset and voltage monitor 0 reset, set the LVDAS bit to 0 (voltage monitor 0 reset enabled after reset).

For a setting example of the OFS register, refer to **13.3.1 Setting Example of Option Function Select Area**.

#### LVDAS Bit (Voltage Detection 0 Circuit Start Bit)

The Vdet0 voltage to be monitored by the voltage detection 0 circuit is selected by bits VDSEL0 and VDSEL1.

### 13.2.2 Option Function Select Register 2 (OFS2)

Address 0FFDBh

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	WDTRCS1	WDTRCS0	WDTUFS1	WDTUFS0
After Reset	User Setting Value <sup>(1)</sup>							

Bit	Symbol	Bit Name	Function	R/W
b0	WDTUFS0	Watchdog timer underflow period set bit	b1 b0 0 0: 03FFh 0 1: 0FFFh 1 0: 1FFFh 1 1: 3FFFh	R/W
b1	WDTUFS1			R/W
b2	WDTRCS0	Watchdog timer refresh acknowledgement period set bit	b3 b2 0 0: 25% 0 1: 50% 1 0: 75% 1 1: 100%	R/W
b3	WDTRCS1			R/W
b4	—	Reserved bits	Set to 1.	R/W
b5	—			
b6	—			
b7	—			

Note:

- The OFS2 register is allocated in the flash memory, not in the SFRs. Set appropriate values as ROM data by a program.  
Do not write additions to the OFS2 register. If the block including the OFS2 register is erased, the OFS2 register is set to FFh.  
When blank products are shipped, the OFS2 register is set to FFh. It is set to the written value after written by the user.  
When factory-programming products are shipped, the value of the OFS2 register is the value programmed by the user.

For a setting example of the OFS2 register, refer to **13.3.1 Setting Example of Option Function Select Area**.

#### Bits WDTRCS0 and WDTRCS1 (Watchdog Timer Refresh Acknowledgement Period Set Bit)

Assuming that the period from when the watchdog timer starts counting until it underflows is 100%, the refresh acknowledgement period for the watchdog timer can be selected.

For details, refer to **14.3.1.1 Refresh Acknowledgment Period**.

### 13.3 Notes on Option Function Select Area

#### 13.3.1 Setting Example of Option Function Select Area

The option function select area is allocated in the flash memory, not in the SFRs. Set appropriate values as ROM data by a program. The following shows a setting example.

- To set FFh in the OFS register

```
.org 00FFFCH
```

```
.lword reset | (0FF000000h) ; RESET
```

(Programming formats vary depending on the compiler. Check the compiler manual.)

- To set FFh in the OFS2 register

```
.org 00FFDBH
```

```
.byte 0FFh
```

(Programming formats vary depending on the compiler. Check the compiler manual.)

## 14. Watchdog Timer

The watchdog timer is a function that detects when a program is out of control. Use of the watchdog timer is recommended to improve the reliability of the system.

### 14.1 Overview

The watchdog timer contains a 14-bit counter and allows selection of count source protection mode enable or disable.

Table 14.1 lists the Watchdog Timer Specifications.

Refer to **5.5 Watchdog Timer Reset** for details of the watchdog timer reset.

Figure 14.1 shows a Watchdog Timer Block Diagram.

**Table 14.1 Watchdog Timer Specifications**

Item	Count Source Protection Mode Disabled	Count Source Protection Mode Enabled
Count source	CPU clock	Low-speed on-chip oscillator clock for the watchdog timer
Count operation	Decrement	
Count start condition	Either of the following can be selected: • After a reset, count starts automatically. • Count starts by writing to the WDTS register.	
Count stop condition	Stop mode, wait mode	None
Watchdog timer initialization conditions	<ul style="list-style-type: none"> <li>• Reset</li> <li>• Write 00h and then FFh to the WDTR register (with acknowledgement period setting). <sup>(1)</sup></li> <li>• Underflow</li> </ul>	
Operations at underflow	Watchdog timer interrupt or watchdog timer reset	Watchdog timer reset
Selectable functions	<ul style="list-style-type: none"> <li>• Division ratio of the prescaler Selected by the WDTC7 bit in the WDTC register.</li> <li>• Count source protection mode Whether count source protection mode is enabled or disabled after a reset can be selected by the CSPROINI bit in the OFS register (flash memory). If count source protection mode is disabled after a reset, it can be enabled or disabled by the CSPRO bit in the CSPR register (program).</li> <li>• Start or stop of the watchdog timer after a reset Selected by the WDTON bit in the OFS register (flash memory).</li> <li>• Initial value of the watchdog timer Selectable by bits WDTUFS0 and WDTUFS1 in the OFS2 register.</li> <li>• Refresh acknowledgement period for the watchdog timer Selectable by bits WDTRCS0 and WDTRCS1 in the OFS2 register.</li> </ul>	

Note:

1. Write the WDTR register during the count operation of the watchdog timer.

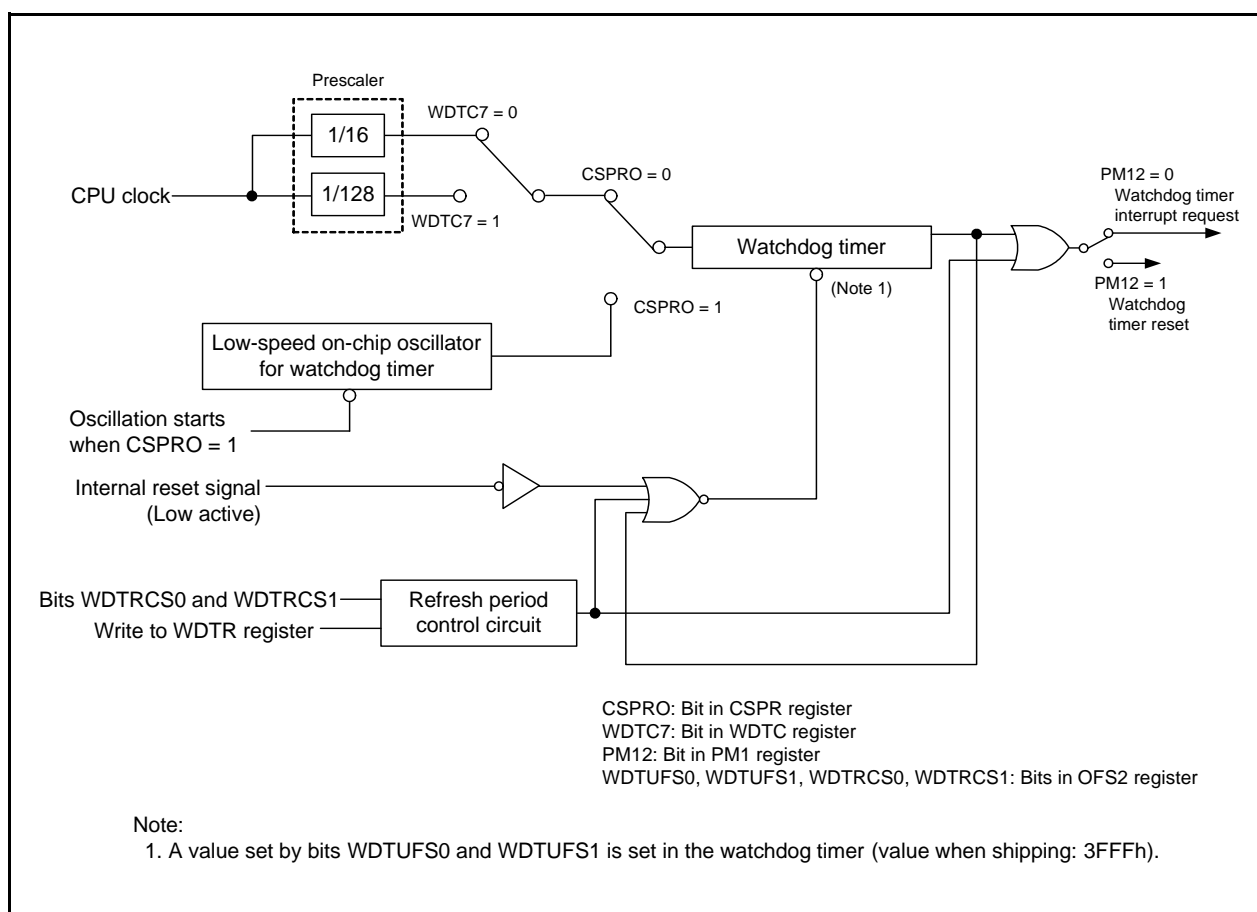

Figure 14.1 Watchdog Timer Block Diagram

## 14.2 Registers

### 14.2.1 Processor Mode Register 1 (PM1)

Address 0005h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	—	PM12	—	—
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	—	Reserved bits	Set to 0.	R/W
b1	—			
b2	PM12	WDT interrupt/reset switch bit	0: Watchdog timer interrupt 1: Watchdog timer reset <sup>(1)</sup>	R/W
b3	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b4	—			
b5	—			
b6	—			
b7	—	Reserved bit	Set to 0.	R/W

Note:

- The PM12 bit is set to 1 when 1 is written by a program (and remains unchanged even if 0 is written to it). This bit is automatically set to 1 when the CSPRO bit in the CSPR register is set to 1 (count source protection mode enabled).

Set the PRC1 bit in the PRCR register to 1 (write enabled) before rewriting the PM1 register.

### 14.2.2 Watchdog Timer Reset Register (WDTR)

Address 000Dh

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	—	—	—	—
After Reset	X	X	X	X	X	X	X	X

Bit	Function	R/W
b7 to b0	Writing 00h and then FFh to this register initializes the watchdog timer. The initial value of the watchdog timer is specified by bits WDTUFS0 and WDTUF1 in the OFS2 register. <sup>(1)</sup>	W

Note:

- Write the WDTR register during the count operation of the watchdog timer.

### 14.2.3 Watchdog Timer Start Register (WDTs)

Address 000Eh

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	—	—	—	—
After Reset	X	X	X	X	X	X	X	X

Bit	Function	R/W
b7 to b0	A write instruction to this register starts the watchdog timer.	W

### 14.2.4 Watchdog Timer Control Register (WDTC)

Address 000Fh

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	WDTC7	—	—	—	—	—	—	—
When Shipping	0	0	1	1	1	1	1	1

Bit	Symbol	Bit Name	Function	R/W
b0	—	The following bits of the watchdog timer can be read. When bits WDTUFS1 to WDTUFS0 in the OFS2 register are 00b (03FFh): b5 to b0 01b (0FFFh): b7 to b2 10b (1FFFh): b8 to b3 11b (3FFFh): b9 to b4		R
b1	—			R
b2	—			R
b3	—			R
b4	—			R
b5	—			R
b6	—	Reserved bit	When read, the content is 0.	R
b7	WDTC7	Prescaler select bit	0: Divided-by-16 1: Divided-by-128	R/W

### 14.2.5 Count Source Protection Mode Register (CSPR)

Address 001Ch

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	CSPRO	—	—	—	—	—	—	—
After Reset	0	0	0	0	0	0	0	0

The above applies when the CSPROINI bit in the OFS register is set to 1.

After Reset	1	0	0	0	0	0	0	0
-------------	---	---	---	---	---	---	---	---

The above applies when the CSPROINI bit in the OFS register is set to 0.

Bit	Symbol	Bit Name	Function	R/W
b0	—	Reserved bits	Set to 0.	R/W
b1	—			
b2	—			
b3	—			
b4	—			
b5	—			
b6	—			
b7	CSPRO	Count source protection mode select bit <sup>(1)</sup>	0: Count source protection mode disabled 1: Count source protection mode enabled	R/W

Note:

1. To set the CSPRO bit to 1, write 0 and then 1 to it. This bit cannot be set to 0 by a program. Disable interrupts and DTC activation between writing 0 and writing 1.

### 14.2.6 Option Function Select Register (OFS)

Address 0FFFFh

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	CSPROINI	LVDAS	VDSEL1	VDSEL0	ROMCP1	ROMCR	—	WDTON
After Reset	User Setting Value <sup>(1)</sup>							

Bit	Symbol	Bit Name	Function	R/W
b0	WDTON	Watchdog timer start select bit	0: Watchdog timer automatically starts after reset. 1: Watchdog timer is stopped after reset.	R/W
b1	—	Reserved bit	Set to 1.	R/W
b2	ROMCR	ROM code protect disable bit	0: ROM code protect disabled 1: ROMCP1 bit enabled	R/W
b3	ROMCP1	ROM code protect bit	0: ROM code protect enabled 1: ROM code protect disabled	R/W
b4	VDSEL0	Voltage detection 0 level select bit <sup>(2)</sup>	b5 b4 0 0: 3.80 V selected (Vdet0_3) 0 1: 2.85 V selected (Vdet0_2) 1 0: 2.35 V selected (Vdet0_1) 1 1: 1.90 V selected (Vdet0_0)	R/W
b5	VDSEL1			R/W
b6	LVDAS	Voltage detection 0 circuit start bit <sup>(3)</sup>	0: Voltage monitor 0 reset enabled after reset 1: Voltage monitor 0 reset disabled after reset	R/W
b7	CSPROINI	Count source protection mode after reset select bit	0: Count source protect mode enabled after reset 1: Count source protect mode disabled after reset	R/W

Notes:

- The OFS register is allocated in the flash memory, not in the SFRs. Set appropriate values as ROM data by a program.  
Do not write additions to the OFS register. If the block including the OFS register is erased, the OFS register is set to FFh.  
When blank products are shipped, the OFS register is set to FFh. It is set to the written value after written by the user.  
When factory-programming products are shipped, the value of the OFS register is the value programmed by the user.
- The same level of the voltage detection 0 level selected by bits VDSEL0 and VDSEL1 is set in both functions of voltage monitor 0 reset and power-on reset.
- To use power-on reset and voltage monitor 0 reset, set the LVDAS bit to 0 (voltage monitor 0 reset enabled after reset).

For a setting example of the OFS register, refer to **13.3.1 Setting Example of Option Function Select Area**.

#### LVDAS Bit (Voltage Detection 0 Circuit Start Bit)

The Vdet0 voltage to be monitored by the voltage detection 0 circuit is selected by bits VDSEL0 and VDSEL1.

### 14.2.7 Option Function Select Register 2 (OFS2)

Address 0FFDBh

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	WDTRCS1	WDTRCS0	WDTUFS1	WDTUFS0
After Reset	User Setting Value <sup>(1)</sup>							

Bit	Symbol	Bit Name	Function	R/W
b0	WDTUFS0	Watchdog timer underflow period set bit	b1 b0 0 0: 03FFh 0 1: 0FFFh 1 0: 1FFFh 1 1: 3FFFh	R/W
b1	WDTUFS1			R/W
b2	WDTRCS0	Watchdog timer refresh acknowledgement period set bit	b3 b2 0 0: 25% 0 1: 50% 1 0: 75% 1 1: 100%	R/W
b3	WDTRCS1			R/W
b4	—	Reserved bits	Set to 1.	R/W
b5	—			
b6	—			
b7	—			

Note:

- The OFS2 register is allocated in the flash memory, not in the SFRs. Set appropriate values as ROM data by a program.  
Do not write additions to the OFS2 register. If the block including the OFS2 register is erased, the OFS2 register is set to FFh.  
When blank products are shipped, the OFS2 register is set to FFh. It is set to the written value after written by the user.  
When factory-programming products are shipped, the value of the OFS2 register is the value programmed by the user.

For a setting example of the OFS2 register, refer to **13.3.1 Setting Example of Option Function Select Area**.

#### Bits WDTRCS0 and WDTRCS1 (Watchdog Timer Refresh Acknowledgement Period Set Bit)

Assuming that the period from when the watchdog timer starts counting until it underflows is 100%, the refresh acknowledgement period for the watchdog timer can be selected.

For details, refer to **14.3.1.1 Refresh Acknowledgment Period**.

## 14.3 Functional Description

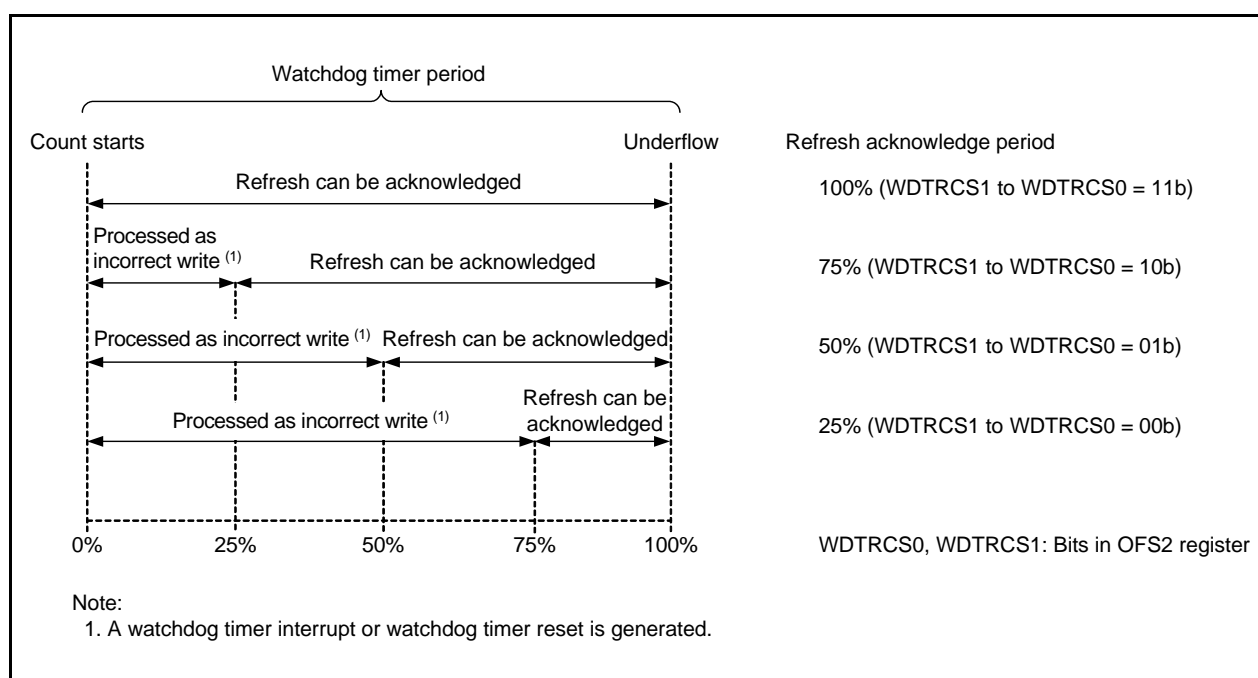

### 14.3.1 Common Items for Multiple Modes

#### 14.3.1.1 Refresh Acknowledgment Period

The period for acknowledging refreshment operation to the watchdog timer (write to the WDTR register) can be selected by bits WDTRCS0 and WDTRCS1 in the OFS2 register. Figure 14.2 shows the Refresh Acknowledgement Period for Watchdog Timer.

Assuming that the period from when the watchdog timer starts counting until it underflows is 100%, a refresh operation executed during the refresh acknowledgement period is acknowledged. Any refresh operation executed during the period other than the above is processed as an incorrect write, and a watchdog timer interrupt or watchdog timer reset (selectable by the PM12 bit in the PM1 register) is generated.

Do not execute any refresh operation while the count operation of the watchdog timer is stopped.

**Figure 14.2 Refresh Acknowledgement Period for Watchdog Timer**

### 14.3.2 Count Source Protection Mode Disabled

The count source for the watchdog timer is the CPU clock when count source protection mode is disabled.  
Table 14.2 lists the Watchdog Timer Specifications (Count Source Protection Mode Disabled).

**Table 14.2 Watchdog Timer Specifications (Count Source Protection Mode Disabled)**

Item	Specification
Count source	CPU clock
Count operation	Decrement
Period	$\text{Division ratio of prescaler (n)} \times \text{count value of watchdog timer (m)}^{(1)}$ CPU clock n: 16 or 128 (selected by the WDTC7 bit in the WDTC register) m: Value set by bits WDTUFS0 and WDTUFS1 in the OFS2 register Example: The period is approximately 13.1 ms when: - The CPU clock frequency is set to 20 MHz. - The prescaler is divided by 16. - Bits WDTUFS1 to WDTUFS0 are set to 11b (3FFFh).
Watchdog timer initialization conditions	<ul style="list-style-type: none"> <li>• Reset</li> <li>• Write 00h and then FFh to the WDTR register. <sup>(3)</sup></li> <li>• Underflow</li> </ul>
Count start conditions	The operation of the watchdog timer after a reset is selected by the WDTON bit <sup>(2)</sup> in the OFS register (address 0FFFFh). <ul style="list-style-type: none"> <li>• When the WDTON bit is set to 1 (watchdog timer is stopped after reset). The watchdog timer and prescaler are stopped after a reset and start counting when the WDTS register is written to.</li> <li>• When the WDTON bit is set to 0 (watchdog timer starts automatically after reset). The watchdog timer and prescaler start counting automatically after a reset.</li> </ul>
Count stop condition	Stop mode, wait mode (Count resumes from the retained value after exiting.)
Operations at underflow	<ul style="list-style-type: none"> <li>• When the PM12 bit in the PM1 register is set to 0. Watchdog timer interrupt</li> <li>• When the PM12 bit in the PM1 register is set to 1. Watchdog timer reset (Refer to <b>5.5 Watchdog Timer Reset.</b>)</li> </ul>

**Notes:**

1. The watchdog timer is initialized when 00h and then FFh is written to the WDTR register. The prescaler is initialized after a reset. This may cause some errors due to the prescaler during the watchdog timer period.
2. The WDTON bit cannot be changed by a program. To set this bit, write 0 to bit 0 of address 0FFFFh with a flash programmer.
3. Write the WDTR register during the count operation of the watchdog timer.

### 14.3.3 Count Source Protection Mode Enabled

The count source for the watchdog timer is the low-speed on-chip oscillator clock for the watchdog timer when count source protection mode is enabled. If the CPU clock stops when a program is out of control, the clock can still be supplied to the watchdog timer.

Table 14.3 lists the Watchdog Timer Specifications (Count Source Protection Mode Enabled).

**Table 14.3 Watchdog Timer Specifications (Count Source Protection Mode Enabled)**

Item	Specification
Count source	Low-speed on-chip oscillator clock
Count operation	Decrement
Period	<p>Count value of watchdog timer (m)</p> <p>Low-speed on-chip oscillator clock for the watchdog timer</p> <p>m: Value set by bits WDTUFS0 and WDTUFS1 in the OFS2 register</p> <p>Example:</p> <p>The period is approximately 8.2 ms when:</p> <ul style="list-style-type: none"> <li>- The on-chip oscillator clock for the watchdog timer is set to 125 kHz.</li> <li>- Bits WDTUFS1 to WDTUFS0 are set to 00b (03FFh).</li> </ul>
Watchdog timer initialization conditions	<ul style="list-style-type: none"> <li>• Reset</li> <li>• Write 00h and then FFh to the WDTR register. <sup>(3)</sup></li> <li>• Underflow</li> </ul>
Count start conditions	<p>The operation of the watchdog timer after a reset is selected by the WDTON bit <sup>(1)</sup> in the OFS register (address 0FFFFh).</p> <ul style="list-style-type: none"> <li>• When the WDTON bit is set to 1 (watchdog timer is stopped after reset). The watchdog timer and prescaler are stopped after a reset and start counting when the WDTS register is written to.</li> <li>• When the WDTON bit is set to 0 (watchdog timer starts automatically after reset). The watchdog timer and prescaler start counting automatically after a reset.</li> </ul>
Count stop condition	None (Count does not stop even in wait mode and stop mode once it starts.)
Operation at underflow	Watchdog timer reset (Refer to <b>5.5 Watchdog Timer Reset.</b> )
Registers, bits	<ul style="list-style-type: none"> <li>• When the CSPPRO bit in the CSPR register is set to 1 (count source protection mode enabled) <sup>(2)</sup>, the following are set automatically: <ul style="list-style-type: none"> <li>- The low-speed on-chip oscillator for the watchdog timer is on.</li> <li>- The PM12 bit in the PM1 register is set to 1 (watchdog timer reset when the watchdog timer underflows).</li> </ul> </li> </ul>

Notes:

1. The WDTON bit cannot be changed by a program. To set this bit, write 0 to bit 0 of address 0FFFFh with a flash programmer.
2. Even if 0 is written to the CSPROINI bit in the OFS register, the CSPPRO bit is set to 1. The CSPROINI bit cannot be changed by a program. To set this bit, write 0 to bit 7 of address 0FFFFh with a flash programmer.
3. Write the WDTR register during the count operation of the watchdog timer.

## 15. DTC

The DTC (data transfer controller) is a function that transfers data between the SFR and on-chip memory without using the CPU. This chip incorporates one DTC channel. The DTC is activated by a peripheral function interrupt to perform data transfers. The DTC and CPU use the same bus, and the DTC takes priority over the CPU in using the bus.

To control DTC data transfers, control data comprised of a transfer source address, a transfer destination address, and operating modes are allocated in the DTC control data area. Each time the DTC is activated, the DTC reads control data to perform data transfers.

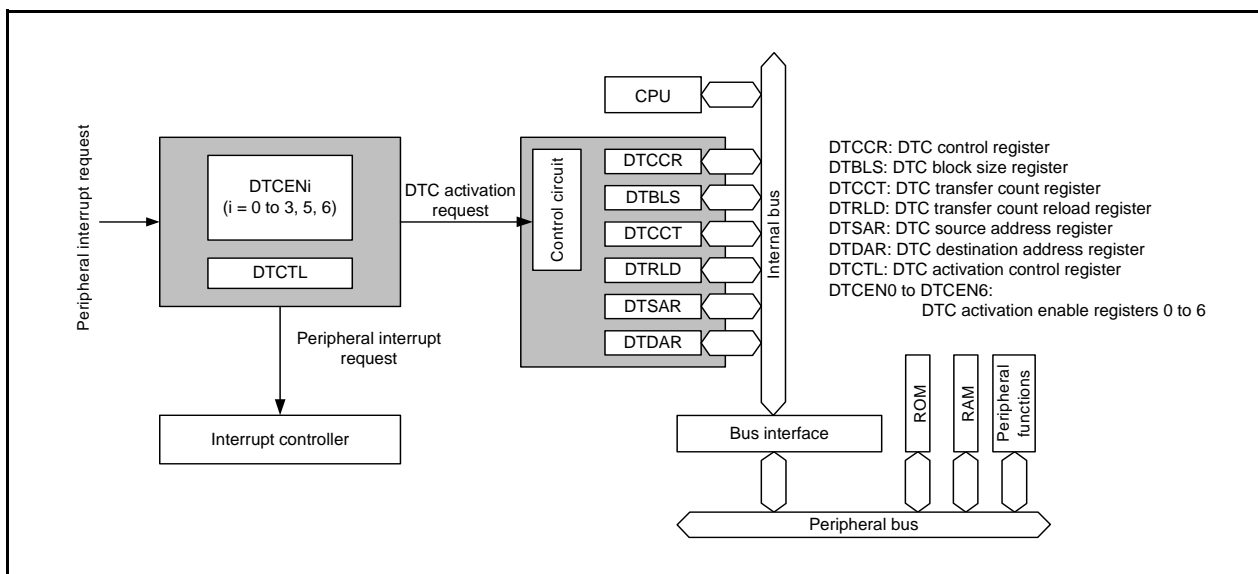

### 15.1 Overview

Table 15.1 lists the DTC Specifications.

**Table 15.1 DTC Specifications**

Item		Specification
Activation sources		22 sources
Allocatable control data		24 sets
Address space which can be transferred		64 Kbytes (00000h to 0FFFFh)
Maximum number of transfer times	Normal mode	256 times
	Repeat mode	255 times
Maximum size of block to be transferred	Normal mode	256 bytes
	Repeat mode	255 bytes
Unit of transfers		Byte
Transfer mode	Normal mode	Transfers end on completion of the transfer causing the DTCCTj register value to change from 1 to 0.
	Repeat mode	On completion of the transfer causing the DTCCTj register value to change from 1 to 0, the repeat area address is initialized and the DTRLDj register value is reloaded to the DTCCTj register to continue transfers.
Address control	Normal mode	Fixed or incremented
	Repeat mode	Addresses of the area not selected as the repeat area are fixed or incremented.
Priority of activation sources		Refer to <b>Table 15.5 DTC Activation Sources and DTC Vector Addresses</b> .
Interrupt request	Normal mode	When the data transfer causing the DTCCTj register value to change from 1 to 0 is performed, the activation source interrupt request is generated for the CPU, and interrupt handling is performed on completion of the data transfer.
	Repeat mode	When the data transfer causing the DTCCTj register value to change from 1 to 0 is performed while the RPTINT bit in the DTCCRj register is 1 (interrupt generation enabled), the activation source interrupt request is generated for the CPU, and interrupt handling is performed on completion of the transfer.
Transfer start		When bits DTCENi0 to DTCENi7 in the DTCENi registers are 1 (activation enabled), data transfer is started each time the corresponding DTC activation sources are generated.
Transfer stop	Normal mode	<ul style="list-style-type: none"> <li>• When bits DTCENi0 to DTCENi7 are set to 0 (activation disabled).</li> <li>• When the data transfer causing the DTCCTj register value to change from 1 to 0 is completed.</li> </ul>
	Repeat mode	<ul style="list-style-type: none"> <li>• When bits DTCENi0 to DTCENi7 are set to 0 (activation disabled).</li> <li>• When the data transfer causing the DTCCTj register value to change from 1 to 0 is completed while the RPTINT bit is 1 (interrupt generation enabled).</li> </ul>

i = 0 to 3, 5, 6, j = 0 to 23

**Figure 15.1 DTC Block Diagram**

## 15.2 Registers

When the DTC is activated, control data (DTCCR<sub>j</sub>, DTBLS<sub>j</sub>, DTCCT<sub>j</sub>, DTRLD<sub>j</sub>, DTSAR<sub>j</sub>, and DTDAR<sub>j</sub>,  $j = 0$  to 23) allocated in the control data area is read, and then transferred to the control registers (DTCCR, DTBLS, DTCCT, DTRLD, DTSAR, and DTDAR) in the DTC. On completion of the DTC data transfer, the contents of the DTC control registers are written back to the control data area.

Each DTCCR, DTBLS, DTCCT, DTRLD, DTSAR, and DTDAR register cannot be directly read or written to. DTCCR<sub>j</sub>, DTBLS<sub>j</sub>, DTCCT<sub>j</sub>, DTRLD<sub>j</sub>, DTSAR<sub>j</sub>, and DTDAR<sub>j</sub> are allocated as control data at addresses from 2C40h to 2CFFh in the DTC control data area, and can be directly accessed.

Also, registers DTCTL and DTCEN<sub>i</sub> ( $i = 0$  to 3, 5, 6) can be directly accessed.

### 15.2.1 DTC Control Register j (DTCCRj) (j = 0 to 23)

Address Refer to **Table 15.4 Control Data Allocation Addresses**.

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	RPTINT	CHNE	DAMOD	SAMOD	RPTSEL	MODE
After Reset	X	X	X	X	X	X	X	X

Bit	Symbol	Bit Name	Function	R/W
b0	MODE	Transfer mode select bit	0: Normal mode 1: Repeat mode	R/W
b1	RPTSEL	Repeat area select bit <sup>(1)</sup>	0: Transfer destination is the repeat area. 1: Transfer source is the repeat area.	R/W
b2	SAMOD	Source address control bit <sup>(2)</sup>	0: Fixed 1: Incremented	R/W
b3	DAMOD	Destination address control bit <sup>(2)</sup>	0: Fixed 1: Incremented	R/W
b4	CHNE	Chain transfer enable bit <sup>(3)</sup>	0: Chain transfers disabled 1: Chain transfers enabled	R/W
b5	RPTINT	Repeat mode interrupt enable bit <sup>(1)</sup>	0: Interrupt generation disabled 1: Interrupt generation enabled	R/W
b6	—	Reserved bits	Set to 0.	R/W
b7	—			

Notes:

1. This bit is valid when the MODE bit is 1 (repeat mode).
2. Settings of bits SAMOD and DAMOD are invalid for the repeat area.
3. Set the CHNE bit in the DTCCR23 register to 0 (chain transfers disabled).

### 15.2.2 DTC Block Size Register j (DTBLSj) (j = 0 to 23)

Address Refer to **Table 15.4 Control Data Allocation Addresses**.

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	—	—	—	—
After Reset	X	X	X	X	X	X	X	X

Bit	Function	Setting Range	R/W
b7 to b0	These bits specify the size of the data block to be transferred by one activation.	00h to FFh <sup>(1)</sup>	R/W

Note:

1. When the DTBLS register is set to 00h, the block size is 256 bytes.

### 15.2.3 DTC Transfer Count Register j (DTCCTj) (j = 0 to 23)

Address Refer to **Table 15.4 Control Data Allocation Addresses**.

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	—	—	—	—
After Reset	X	X	X	X	X	X	X	X

Bit	Function	Setting Range	R/W
b7 to b0	These bits specify the number of times of DTC data transfers.	00h to FFh <sup>(1)</sup>	R/W

Note:

- When the DTCCT register is set to 00h, the number of transfer times is 256. Each time the DTC is activated, the DTCCT register is decremented by 1.

### 15.2.4 DTC Transfer Count Reload Register j (DTRLdj) (j = 0 to 23)

Address Refer to **Table 15.4 Control Data Allocation Addresses**.

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	—	—	—	—
After Reset	X	X	X	X	X	X	X	X

Bit	Function	Setting Range	R/W
b7 to b0	This register value is reloaded to the DTCCT register in repeat mode.	00h to FFh <sup>(1)</sup>	R/W

Note:

- Set the initial value for the DTCCT register.

### 15.2.5 DTC Source Address Register j (DTSARj) (j = 0 to 23)

Address Refer to **Table 15.4 Control Data Allocation Addresses**.

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	—	—	—	—
After Reset	X	X	X	X	X	X	X	X

Bit	b15	b14	b13	b12	b11	b10	b9	b8
Symbol	—	—	—	—	—	—	—	—
After Reset	X	X	X	X	X	X	X	X

Bit	Function	Setting Range	R/W
b15 to b0	These bits specify a transfer source address for data transfer.	0000h to FFFFh	R/W

### 15.2.6 DTC Destination Address Register j (DTDARj) (j = 0 to 23)

Address Refer to **Table 15.4 Control Data Allocation Addresses**.

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	—	—	—	—
After Reset	X	X	X	X	X	X	X	X

Bit	b15	b14	b13	b12	b11	b10	b9	b8
Symbol	—	—	—	—	—	—	—	—
After Reset	X	X	X	X	X	X	X	X

Bit	Function	Setting Range	R/W
b15 to b0	These bits specify a transfer destination address for data transfer.	0000h to FFFFh	R/W

### 15.2.7 DTC Activation Enable Register i (DTCENi) (i = 0 to 3, 5, 6)

Address 0088h (DTCEN0), 0089h (DTCEN1), 008Ah (DTCEN2), 008Bh (DTCEN3), 008Dh (DTCEN5), 008Eh (DTCEN6)

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	DTCENi7	DTCENi6	DTCENi5	DTCENi4	DTCENi3	DTCENi2	DTCENi1	DTCENi0
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	DTCENi0	DTC activation enable bit (1)	0: Activation disabled 1: Activation enabled	R/W
b1	DTCENi1			R/W
b2	DTCENi2			R/W
b3	DTCENi3			R/W
b4	DTCENi4			R/W
b5	DTCENi5			R/W
b6	DTCENi6			R/W
b7	DTCENi7			R/W

Note:

- For the operation of this bit, refer to **15.3.7 Interrupt Sources**.

The DTCENi registers enable/disable DTC activation by interrupt sources. Table 15.2 lists Correspondences between Bits DTCENi0 to DTCENi7 (i = 0 to 3, 5, 6) and Interrupt Sources.

**Table 15.2 Correspondences between Bits DTCENi0 to DTCENi7 (i = 0 to 3, 5, 6) and Interrupt Sources**

Register	DTCENi7 Bit	DTCENi6 Bit	DTCENi5 Bit	DTCENi4 Bit	DTCENi3 Bit	DTCENi2 Bit	DTCENi1 Bit	DTCENi0 Bit
DTCEN0	INT0	INT1	INT2	INT3	—	—	—	—
DTCEN1	Key input	A/D conversion	UART0 reception	UART0 transmission	UART1 reception	UART1 transmission	UART2 reception	UART2 transmission
DTCEN2	—	—	Voltage Monitor 2	Voltage Monitor 1	Sensor control unit data transfer request	—	Timer RC input-capture/compare-match A	Timer RC input-capture/compare-match B
DTCEN3	Timer RC input-capture/compare-match C	Timer RC input-capture/compare-match D	—	—	—	—	—	—
DTCEN5	—	—	—	—	—	—	—	—
DTCEN6	—	Timer RA	—	Timer RB	Flash ready status	—	—	—

### 15.2.8 DTC Activation Control Register (DTCTL)

Address 0080h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	—	—	NMIF	—
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	—	Reserved bit	Set to 0.	R/W
b1	NMIF	Non-maskable interrupt generation bit <sup>(1)</sup>	0: Non-maskable interrupts not generated 1: Non-maskable interrupts generated	R/W
b2	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b3	—			
b4	—			
b5	—			
b6	—			
b7	—			

Note:

1. This bit is set to 0 when the read result is 1 and 0 is written to the same bit. This bit remains unchanged even if the read result is 0 and 0 is written to the same bit. This bit remains unchanged if 1 is written to it.

The DTCTL register controls DTC activation when a non-maskable interrupt (an interrupt by the watchdog timer, oscillation stop detection, voltage monitor 1, or voltage monitor 2) is generated.

#### NMIF Bit (Non-Maskable Interrupt Generation Bit)

The NMIF bit is set to 1 when a watchdog timer interrupt, an oscillation stop detection interrupt, a voltage monitor 1 interrupt, or a voltage monitor 2 interrupt is generated.

When the NMIF bit is 1, the DTC is not activated even if the interrupt which enables DTC activation is generated. If the NMIF bit is changed to 1 during DTC transfer, the transfer is continued until it is completed.

When an interrupt source is the watchdog timer, wait for the following cycles before writing 0 to the NMIF bit:  
If the WDTC7 bit in the WDTC register is set to 0 (divide-by-16 using the prescaler), wait for 16 cycles of the CPU clock after the interrupt source is generated.

If the WDTC7 bit is set to 1 (divide-by-128 using the prescaler), wait for 128 cycles of the CPU clock after the interrupt source is generated.

When an interrupt source is oscillation stop detection, set to the OCD1 bit in the OCD register to 0 (oscillation stop detection interrupt disabled) before writing 0 to the NMIF bit.

## 15.3 Function Description

### 15.3.1 Overview

When the DTC is activated, control data is read from the DTC control data area to perform data transfers and control data after data transfer is written back to the DTC control data area. Twenty-four sets of control data can be stored in the DTC control data area, which allows 24 types of data transfers to be performed.

There are two transfer modes: normal mode and repeat mode. When the CHNE bit in the DTCCRj (j = 0 to 23) register is set to 1 (chain transfers enabled), multiple control data is read and data transfers are continuously performed by one activation source (chain transfers).

A transfer source address is specified by the 16-bit register DTSARj, and a transfer destination address is specified by the 16-bit register DTDARj. The values in the registers DTSARj and DTDARj are separately fixed or incremented according to the control data on completion of the data transfer.

### 15.3.2 Activation Sources

The DTC is activated by an interrupt source. Figure 15.2 is a Block Diagram Showing Control of DTC Activation Sources.

The interrupt sources to activate the DTC are selected with the DTCENi (i = 0 to 3, 5, 6) registers.

The DTC sets 0 (activation disabled) to the corresponding bit among bits DTCENi0 to DTCENi7 in the DTCENi register during operation when the setting of data transfer (the first transfer in chain transfers) is either of the following:

- Transfer causing the DTCCTj (j = 0 to 23) register value to change to 0 in normal mode
- Transfer causing the DTCCTj register value to change to 0 while the RPTINT bit in the DTCCRj register is 1 (interrupt generation enabled) in repeat mode

If the data transfer setting is not either of the above and the activation source is an interrupt source for timer RC or the flash memory, the DTC sets 0 to the interrupt source flag corresponding to the activation source during operation.

Table 15.3 lists the DTC Activation Sources and Interrupt Source Flags for Setting to 0 during DTC Operation.

If multiple activation sources are simultaneously generated, the DTC activation will be performed according to the DTC activation source priority.

If multiple activation sources are simultaneously generated on completion of DTC operation, the next transfer will be performed according to the priority.

DTC activation is not affected by the I flag or interrupt control register, unlike with interrupt request operation. Therefore, even if interrupt requests cannot be acknowledged because interrupts are disabled, DTC activation requests can be acknowledged. The IR bit in the interrupt control register does not change even when an interrupt source to enable DTC activation is generated.

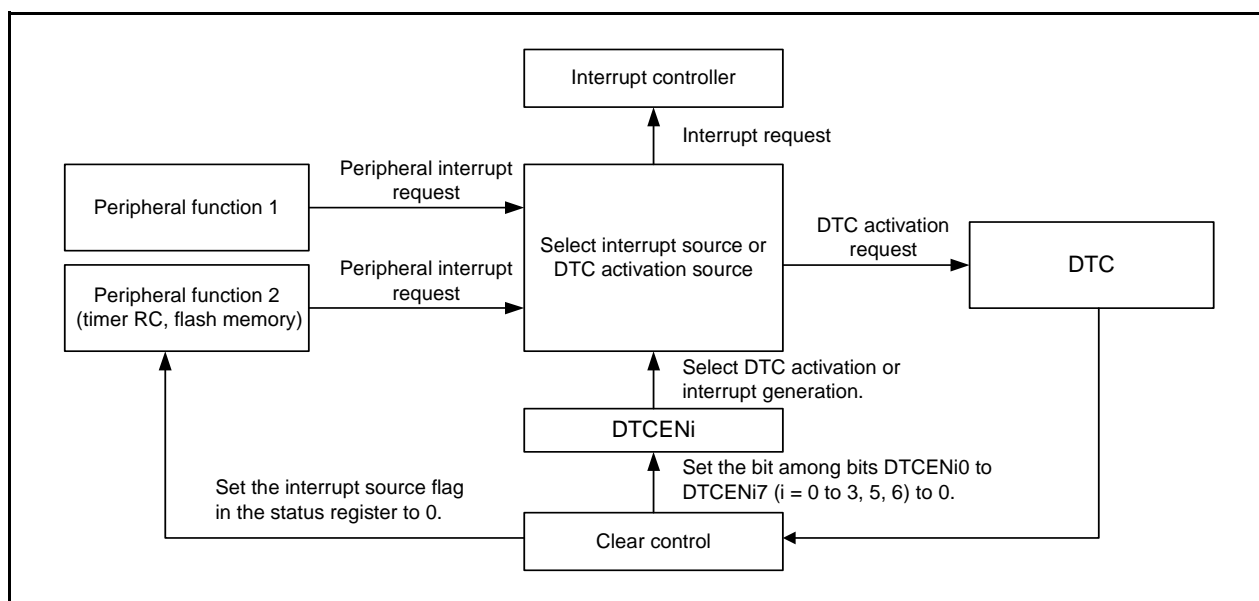

Figure 15.2 Block Diagram Showing Control of DTC Activation Sources

**Table 15.3 DTC Activation Sources and Interrupt Source Flags for Setting to 0 during DTC Operation**

DTC activation source generation	Interrupt Source Flag for Setting to 0
Timer RC input-capture/compare-match A	IMFA bit in TRCSR register
Timer RC input-capture/compare-match B	IMFB bit in TRCSR register
Timer RC input-capture/compare-match C	IMFC bit in TRCSR register
Timer RC input-capture/compare-match D	IMFD bit in TRCSR register
Flash ready status	RDYSTI bit in FST register

### 15.3.3 Control Data Allocation and DTC Vector Table

Control data is allocated in the order: Registers DTCCR<sub>j</sub>, DTBLS<sub>j</sub>, DTCCT<sub>j</sub>, DTRLD<sub>j</sub>, DTSAR<sub>j</sub>, and DTDAR<sub>j</sub> (j = 0 to 23). Table 15.4 lists the Control Data Allocation Addresses.

**Table 15.4 Control Data Allocation Addresses**

Register Symbol	Control Data No.	Address	DTCCR <sub>j</sub> Register	DTBLS <sub>j</sub> Register	DTCCT <sub>j</sub> Register	DTRLD <sub>j</sub> Register	DTSAR <sub>j</sub> Register (Lower 8 Bits)	DTSAR <sub>j</sub> Register (Higher 8 Bits)	DTDAR <sub>j</sub> Register (Lower 8 Bits)	DTDAR <sub>j</sub> Register (Higher 8 Bits)
DTCD0	Control Data 0	2C40h to 2C47h	2C40h	2C41h	2C42h	2C43h	2C44h	2C45h	2C46h	2C47h
DTCD1	Control Data 1	2C48h to 2C4Fh	2C48h	2C49h	2C4Ah	2C4Bh	2C4Ch	2C4Dh	2C4Eh	2C4Fh
DTCD2	Control Data 2	2C50h to 2C57h	2C50h	2C51h	2C52h	2C53h	2C54h	2C55h	2C56h	2C57h
DTCD3	Control Data 3	2C58h to 2C5Fh	2C58h	2C59h	2C5Ah	2C5Bh	2C5Ch	2C5Dh	2C5Eh	2C5Fh
DTCD4	Control Data 4	2C60h to 2C67h	2C60h	2C61h	2C62h	2C63h	2C64h	2C65h	2C66h	2C67h
DTCD5	Control Data 5	2C68h to 2C6Fh	2C68h	2C69h	2C6Ah	2C6Bh	2C6Ch	2C6Dh	2C6Eh	2C6Fh
DTCD6	Control Data 6	2C70h to 2C77h	2C70h	2C71h	2C72h	2C73h	2C74h	2C75h	2C76h	2C77h
DTCD7	Control Data 7	2C78h to 2C7Fh	2C78h	2C79h	2C7Ah	2C7Bh	2C7Ch	2C7Dh	2C7Eh	2C7Fh
DTCD8	Control Data 8	2C80h to 2C87h	2C80h	2C81h	2C82h	2C83h	2C84h	2C85h	2C86h	2C87h
DTCD9	Control Data 9	2C88h to 2C8Fh	2C88h	2C89h	2C8Ah	2C8Bh	2C8Ch	2C8Dh	2C8Eh	2C8Fh
DTCD10	Control Data 10	2C90h to 2C97h	2C90h	2C91h	2C92h	2C93h	2C94h	2C95h	2C96h	2C97h
DTCD11	Control Data 11	2C98h to 2C9Fh	2C98h	2C99h	2C9Ah	2C9Bh	2C9Ch	2C9Dh	2C9Eh	2C9Fh
DTCD12	Control Data 12	2CA0h to 2CA7h	2CA0h	2CA1h	2CA2h	2CA3h	2CA4h	2CA5h	2CA6h	2CA7h
DTCD13	Control Data 13	2CA8h to 2CAFh	2CA8h	2CA9h	2CAAh	2CABh	2CACH	2CADh	2CAEh	2CAFh
DTCD14	Control Data 14	2CB0h to 2CB7h	2CB0h	2CB1h	2CB2h	2CB3h	2CB4h	2CB5h	2CB6h	2CB7h
DTCD15	Control Data 15	2CB8h to 2CBFh	2CB8h	2CB9h	2CBAh	2CBBh	2CBCh	2CBDh	2CBEh	2CBFh
DTCD16	Control Data 16	2CC0h to 2CC7h	2CC0h	2CC1h	2CC2h	2CC3h	2CC4h	2CC5h	2CC6h	2CC7h
DTCD17	Control Data 17	2CC8h to 2CCFh	2CC8h	2CC9h	2CCAh	2CCBh	2CCCh	2CCDh	2CCEh	2CCFh
DTCD18	Control Data 18	2CD0h to 2CD7h	2CD0h	2CD1h	2CD2h	2CD3h	2CD4h	2CD5h	2CD6h	2CD7h
DTCD19	Control Data 19	2CD8h to 2CDFh	2CD8h	2CD9h	2CDAh	2CDBh	2CDCh	2CDDh	2CDEh	2CDFh
DTCD20	Control Data 20	2CE0h to 2CE7h	2CE0h	2CE1h	2CE2h	2CE3h	2CE4h	2CE5h	2CE6h	2CE7h
DTCD21	Control Data 21	2CE8h to 2CEFh	2CE8h	2CE9h	2CEAh	2CEBh	2CECh	2CEDh	2CEEh	2CEFh
DTCD22	Control Data 22	2CF0h to 2CF7h	2CF0h	2CF1h	2CF2h	2CF3h	2CF4h	2CF5h	2CF6h	2CF7h
DTCD23	Control Data 23	2CF8h to 2CFFh	2CF8h	2CF9h	2CFAh	2CFBh	2CFCh	2CFDh	2CFEh	2CFFh

j = 0 to 23

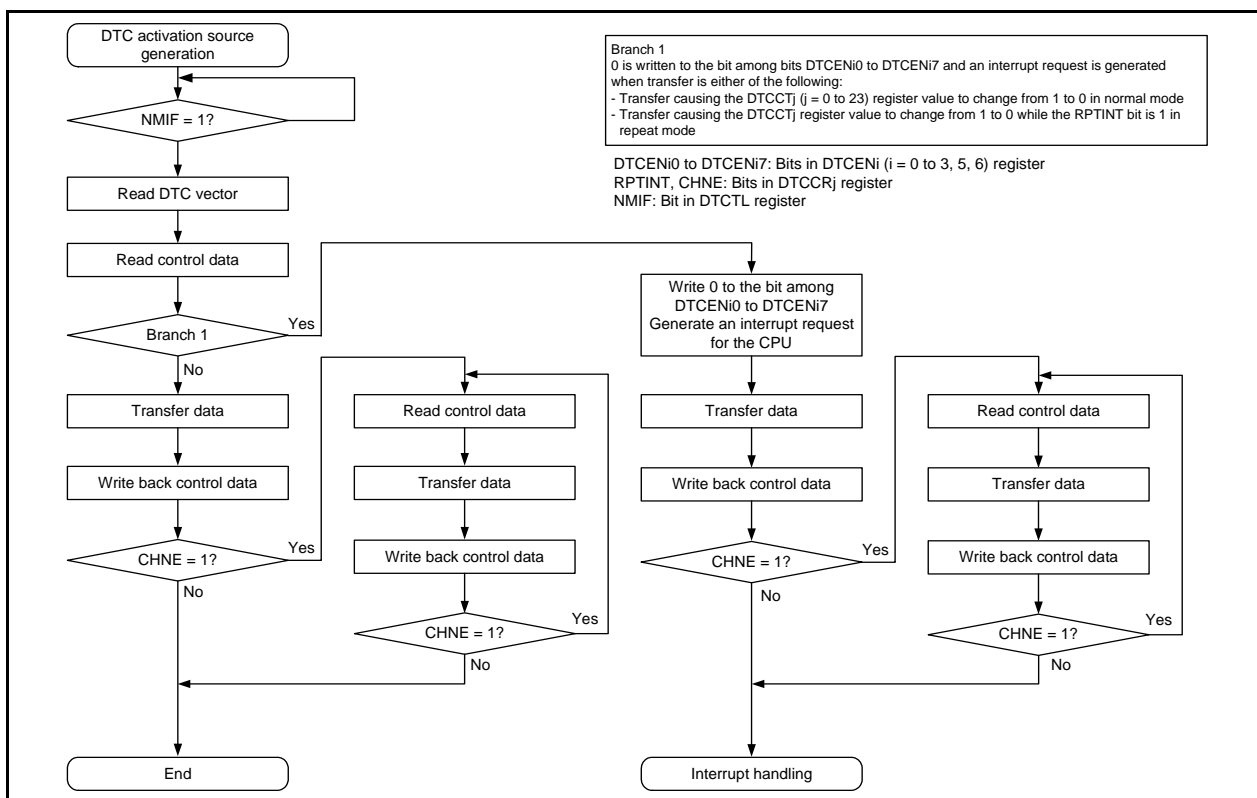

When the DTC is activated, one control data is selected according to the data read from the vector table which has been assigned to each activation source, and the selected control data is read from the DTC control data area.

Table 15.5 lists the DTC Activation Sources and DTC Vector Addresses. A one-byte vector table area is assigned to each activation source and one value from 00000000b to 00010111b (control data numbers in Table 15.4) is stored in each area to select one of the 24 control data sets.

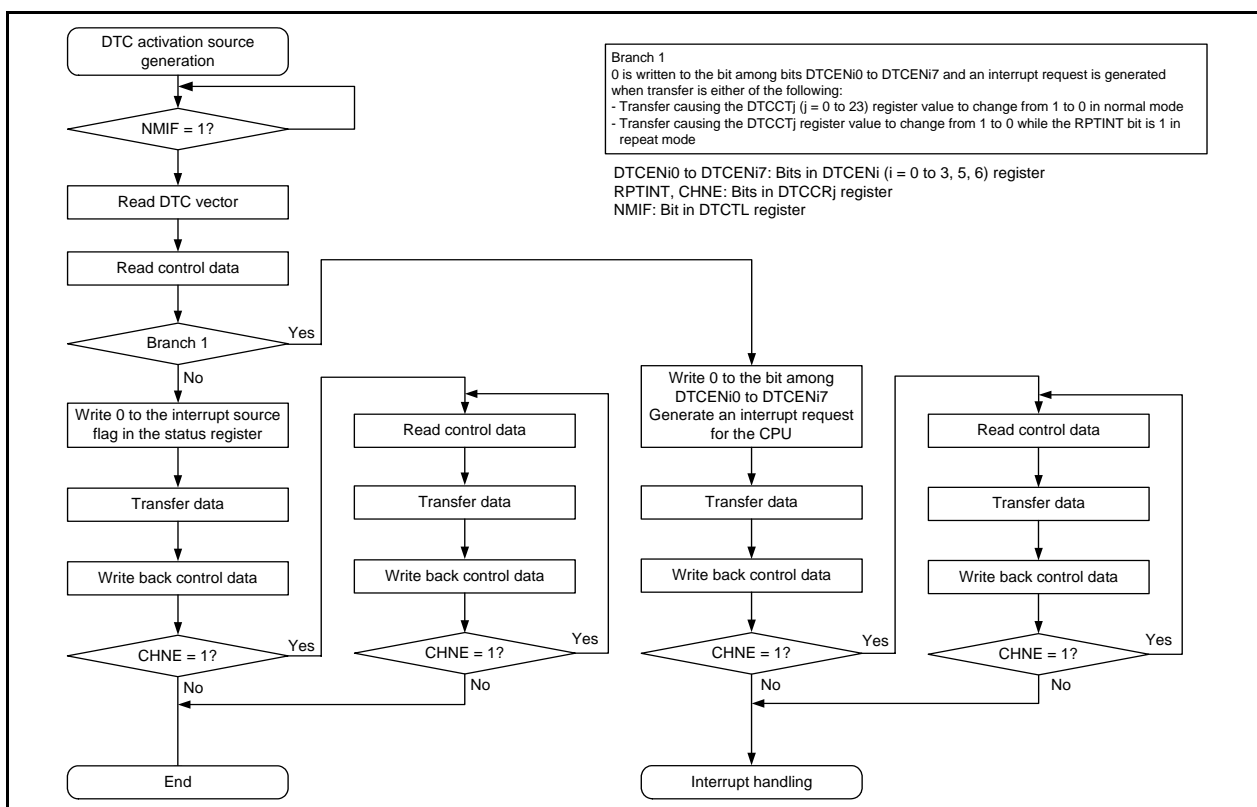

Figures 15.3 to 15.5 show the DTC Internal Operation Flowchart.

**Table 15.5 DTC Activation Sources and DTC Vector Addresses**

Interrupt Request Source	Interrupt Name	Source No.	DTC Vector Address	Priority
External input	INT0	0	2C00h	 High
	INT1	1	2C01h	
	INT2	2	2C02h	
	INT3	3	2C03h

**Figure 15.3 DTC Internal Operation Flowchart When DTC Activation Source is not Timer RC or Flash Memory Interrupt Source**

**Figure 15.4 DTC Internal Operation Flowchart When DTC Activation Source is Timer RC Interrupt Source**

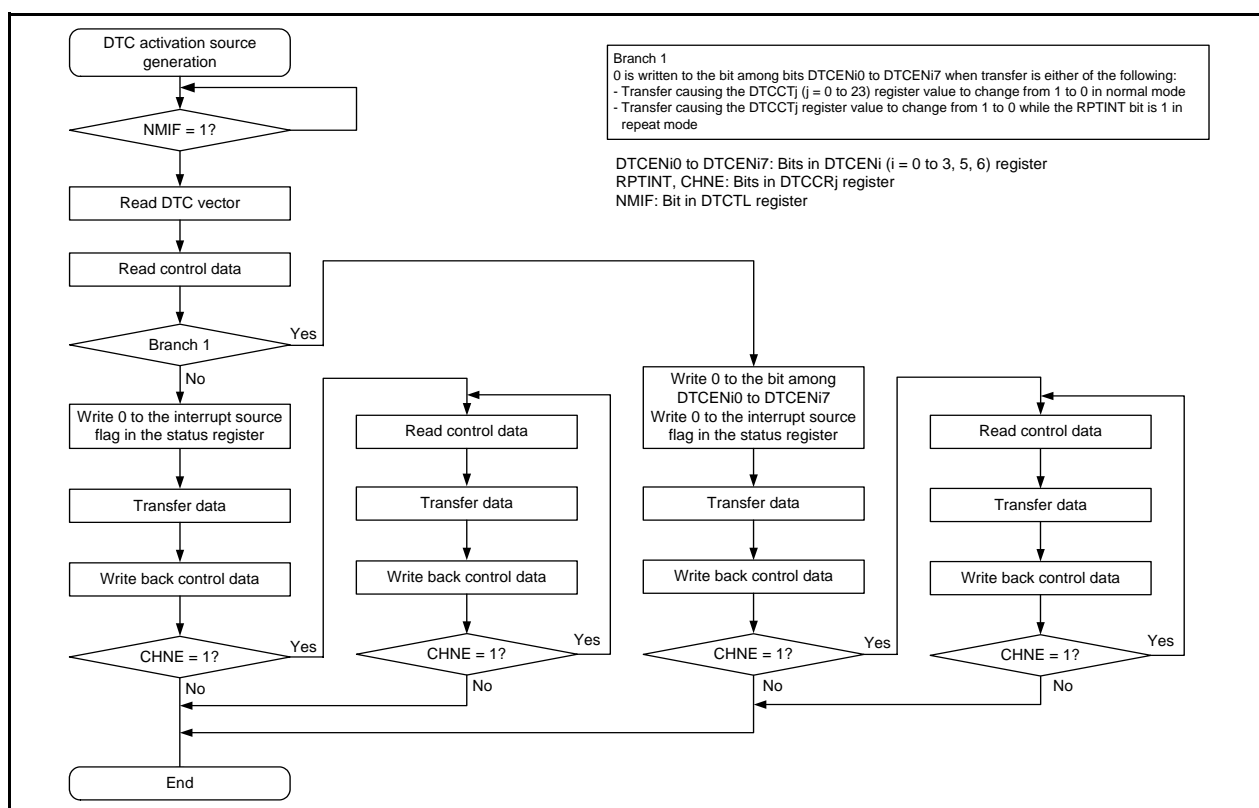

Figure 15.5 DTC Internal Operation Flowchart When DTC Activation Source is Flash ready status

### 15.3.4 Normal Mode

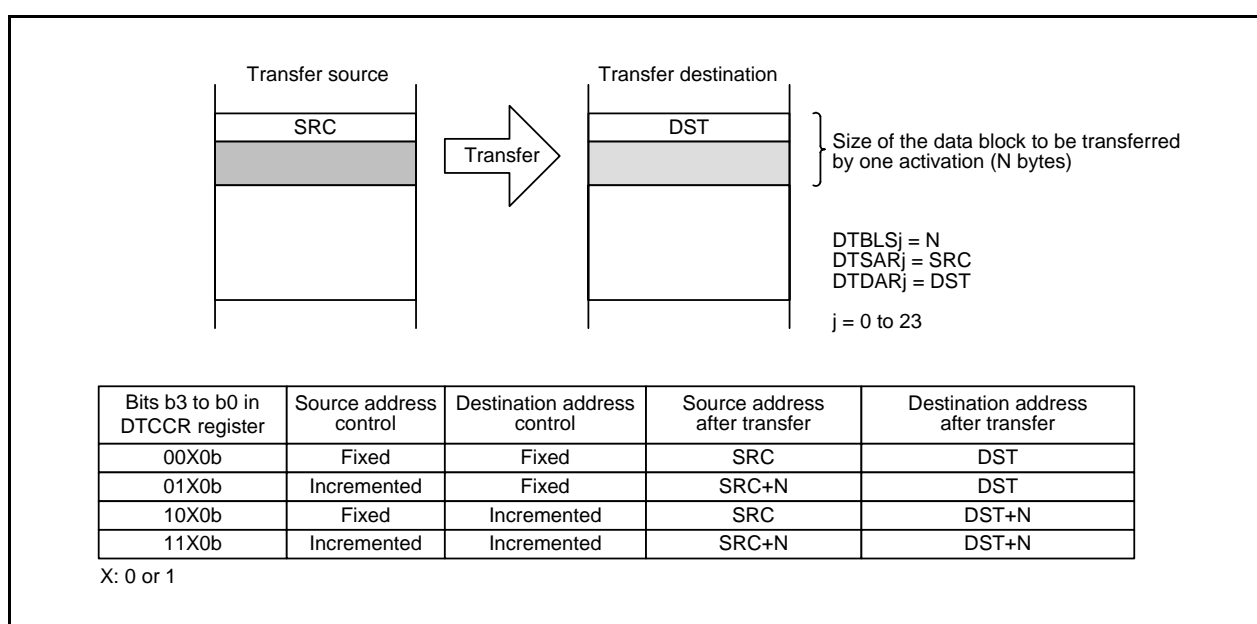

One to 256 bytes of data are transferred by one activation. The number of transfer times can be 1 to 256. When the data transfer causing the DTCCTj (j = 0 to 23) register value to change to 0 is performed, an interrupt request for the CPU is generated during DTC operation.

Table 15.6 lists Register Functions in Normal Mode. Figure 15.6 shows Data Transfers in Normal Mode.

**Table 15.6 Register Functions in Normal Mode**

Register	Symbol	Function
DTC block size register j	DTBLSj	Size of the data block to be transferred by one activation
DTC transfer count register j	DTCCTj	Number of times of data transfers
DTC transfer count reload register j	DTRLDj	Not used
DTC source address register j	DTSARj	Data transfer source address
DTC destination address register j	DTDARj	Data transfer destination address

j = 0 to 23

**Figure 15.6 Data Transfers in Normal Mode**

### 15.3.5 Repeat Mode

One to 255 bytes of data are transferred by one activation. Either of the transfer source or destination should be specified as the repeat area. The number of transfer times can be 1 to 255. On completion of the specified number of transfer times, the DTCCTj (i = 0 to 23) register and the address specified for the repeat area are initialized to continue transfers. When the data transfer causing the DTCCTj register value to change to 0 is performed while the RPTINT bit in the DTCCRj register is 1 (interrupt generation enabled), an interrupt request for the CPU is generated during DTC operation.

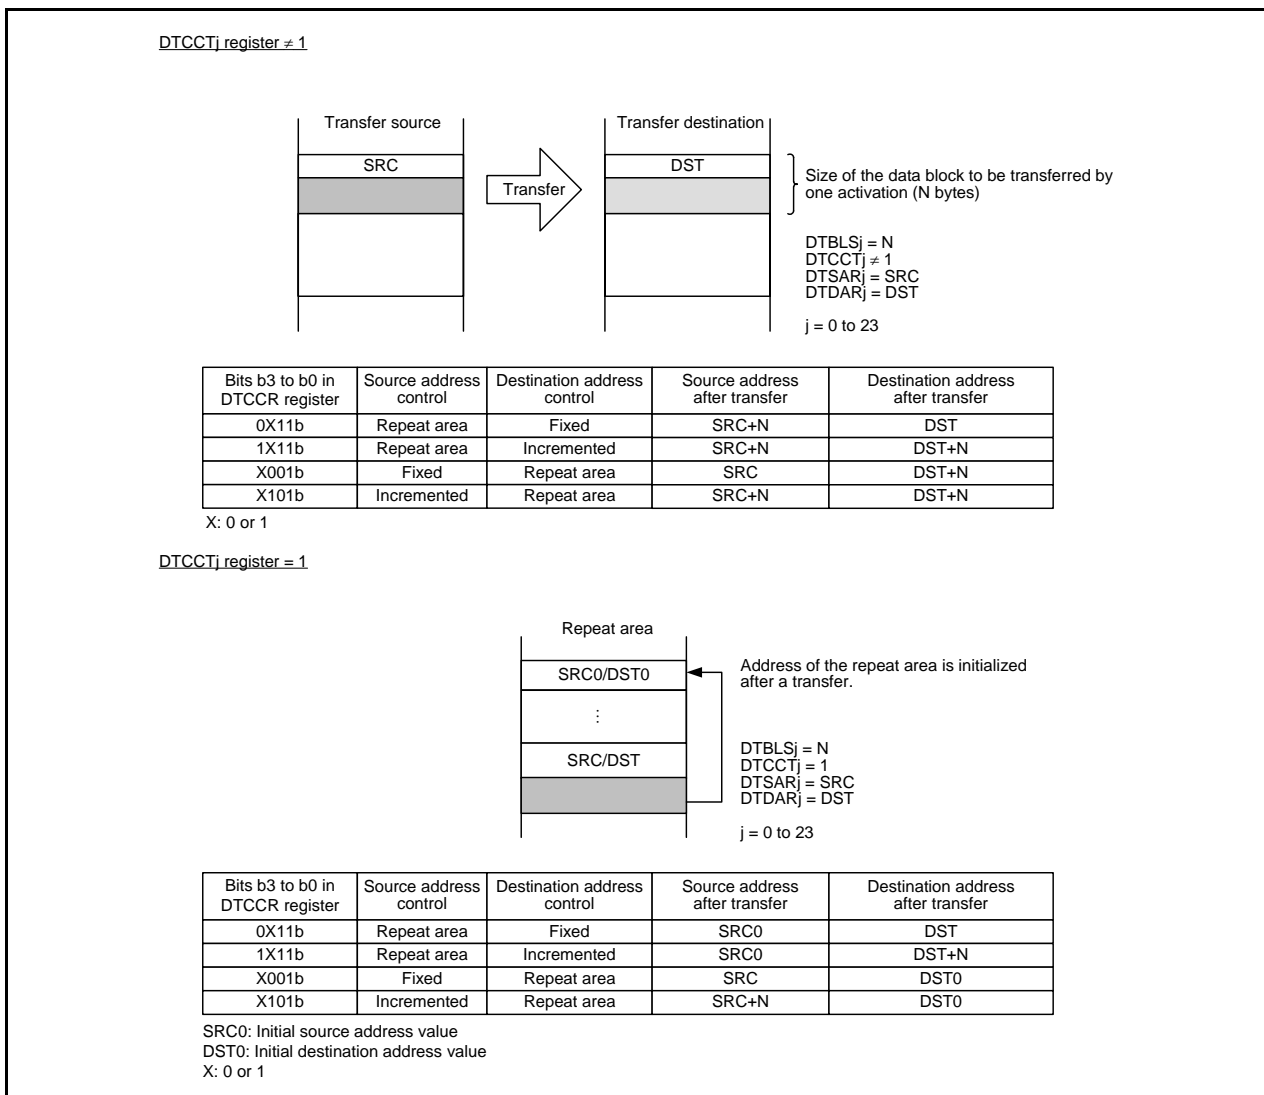

The lower 8 bits of the initial value for the repeat area address must be 00h. The size of data to be transferred must be set to 255 bytes or less before the specified number of transfer times is completed.

Table 15.7 lists Register Functions in Repeat Mode. Figure 15.7 shows Data Transfers in Repeat Mode.

**Table 15.7 Register Functions in Repeat Mode**

Register	Symbol	Function
DTC block size register j	DTBLSj	Size of the data block to be transferred by one activation
DTC transfer count register j	DTCCTj	Number of times of data transfers
DTC transfer count reload register j	DTRLdj	This register value is reloaded to the DTCCT register. (Data transfer count is initialized.)
DTC source address register j	DTSARj	Data transfer source address
DTC destination address register j	DTDARj	Data transfer destination address

j = 0 to 23

**Figure 15.7 Data Transfers in Repeat Mode**

### 15.3.6 Chain Transfers

When the CHNE bit in the DTCCRj (j = 0 to 22) register is 1 (chain transfers enabled), multiple data transfers can be continuously performed by one activation source. Figure 15.8 shows a Flow of Chain Transfers.

When the DTC is activated, one control data is selected according to the data read from the DTC vector address corresponding to the activation source, and the selected control data is read from the DTC control data area. When the CHNE bit for the control data is 1 (chain transfers enabled), the next control data immediately following the current control data is read and transferred after the current transfer is completed. This operation is repeated until the data transfer with the control data for which the CHNE bit is 0 (chain transfers disabled) is completed.

Set the CHNE bit in the DTCCR23 register to 0 (chain transfers disabled).

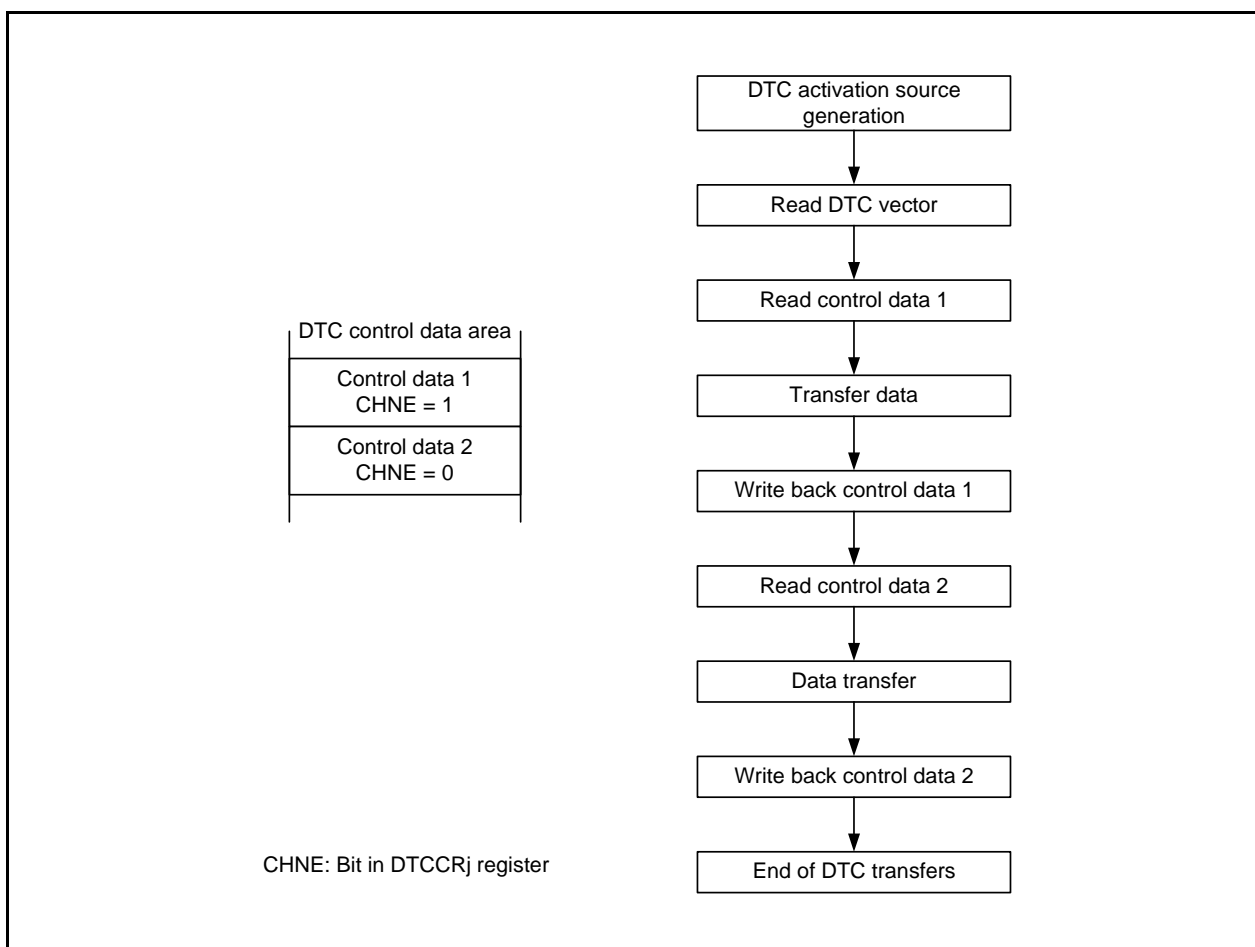

Figure 15.8 Flow of Chain Transfers

### 15.3.7 Interrupt Sources

When the data transfer causing the DTCCTj (j = 0 to 23) register value to change to 0 is performed in normal mode, and when the data transfer causing the DTCCTj register value to change to 0 is performed while the RPTINT bit in the DTCCRj register is 1 (interrupt generation enabled) in repeat mode, the interrupt request corresponding to the activation source is generated for the CPU during DTC operation. However, no interrupt request is generated for the CPU when the activation source is flash ready status.

Interrupt requests for the CPU are affected by the I flag or interrupt control register. In chain transfers, whether the interrupt request is generated or not is determined either by the number of transfer times specified for the first type of the transfer or the RPTINT bit. When an interrupt request is generated for the CPU, the bit among bits DTCENi0 to DTCENi7 in the DTCENi (i = 0 to 3, 5, 6) registers corresponding to the activation source are set to 0 (activation disabled).

### 15.3.8 Operation Timings

The DTC requires five clock cycles to read control data allocated in the DTC control data area. The number of clock cycles required to write back control data differs depending on the control data settings.

Figure 15.9 shows an Example of DTC Operation Timings and Figure 15.10 shows an Example of DTC Operation Timings in Chain Transfers. Table 15.8 lists the Specifications of Control Data Write-Back Operation.

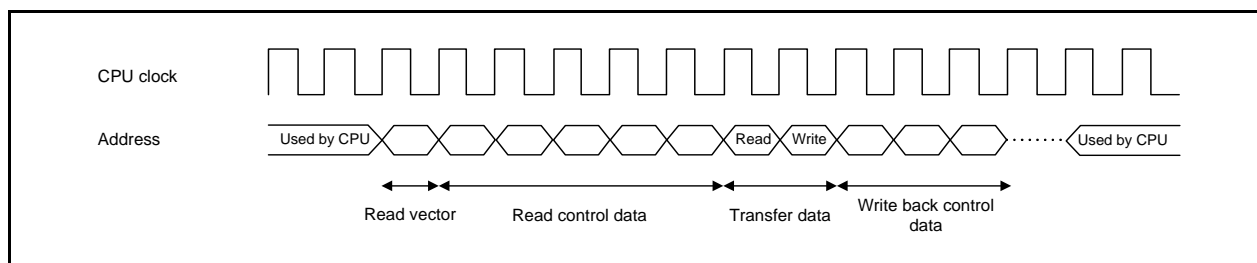

Figure 15.9 Example of DTC Operation Timings

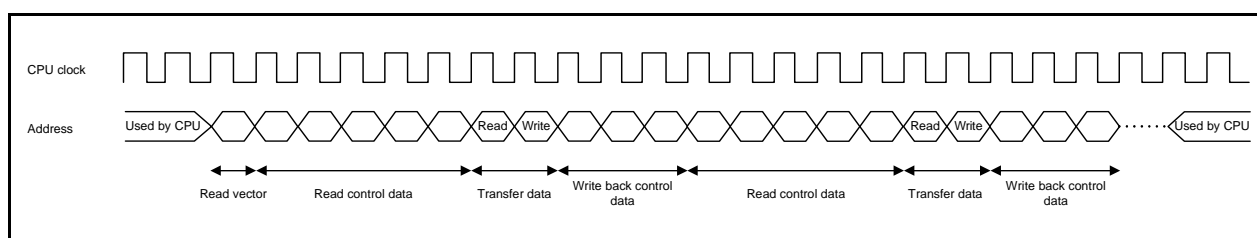

Figure 15.10 Example of DTC Operation Timings in Chain Transfers

Table 15.8 Specifications of Control Data Write-Back Operation

Bits b3 to b0 in DTCCR Register	Operating Mode	Address Control		Control Data to be Written Back				Number of Clock Cycles
		Source	Destination	DTCCTj Register	DTRLdj Register	DTSARj Register	DTDARj Register	
00X0b	Normal mode	Fixed	Fixed	Written back	Written back	Not written back	Not written back	1
01X0b		Incremented	Fixed	Written back	Written back	Written back	Not written back	2
10X0b		Fixed	Incremented	Written back	Written back	Not written back	Written back	2

0X11b	Repeat mode	Repeat area	Fixed	Written back	Written back	Written back	Not written back	2
1X11b			Incremented	Written back	Written back	Written back	Written back	3
X001b		Fixed	Repeat area	Written back	Written back	Not written back	Written back	2
X101b		Incremented		Written back	Written back	Written back	Written back	3

j = 0 to 23

X: 0 or 1

### 15.3.9 Number of DTC Execution Cycles

Table 15.9 lists the Operations Following DTC Activation and Required Number of Cycles for each operation.  
Table 15.10 lists the Number of Clock Cycles Required for Data Transfers.

**Table 15.9 Operations Following DTC Activation and Required Number of Cycles**

Vector Read	Control Data		Data Read	Data Write	Internal Operation
	Read	Write-back			
1	5	(Note 2)	(Note 1)	(Note 1)	1

Notes:

1. For the number of clock cycles required for data read/write, refer to **Table 15.10 Number of Clock Cycles Required for Data Transfers**.
2. For the number of clock cycles required for control data write-back, refer to **Table 15.8 Specifications of Control Data Write-Back Operation**.

Data is transferred as described below, when the DTBLSj (j = 0 to 23) register = N,

- (1) When  $N = 2n$  (even), two-byte transfers are performed n times.
- (2) When  $N = 2n + 1$  (odd), two-byte transfers are performed n times followed by one time of one-byte transfer.

**Table 15.10 Number of Clock Cycles Required for Data Transfers**

Operation	Unit of Transfers	Internal RAM (During DTC Transfers)		Internal ROM (Program ROM)	Internal ROM (Data flash)	SFR (Word Access)		SFR (Byte Access)	SFR (DTC control data area)	
		Even Address	Odd Address			Even Address	Odd Address		Even Address	Odd Address
Data read	1-byte SK1	1		1	2	2		2	1	
	2-byte SK2	1	2	2	4	2	4	4	1	2
Data write	1-byte SL1	1		—	—	2		2	1	
	2-byte SL2	1	2	—	—	2	4	4	1	2

From Tables 15.9 and 15.10, the total number of required execution cycles can be obtained by the following formula:

Number of required execution cycles =  $1 + \Sigma[\text{formula A}] + 2$

$\Sigma$ : Sum of the cycles for the number of transfer times performed by one activation source ([the number of transfer times for which CHNE is set to 1] + 1)

- (1) For  $N = 2n$  (even)

Formula A =  $J + n \cdot SK2 + n \cdot SL2$

- (2) For  $N = 2n + 1$  (odd)

Formula A =  $J + n \cdot SK2 + 1 \cdot SK1 + n \cdot SL2 + 1 \cdot SL1$

J: Number of cycles required to read control data (5 cycles) + number of cycles required to write back control data

To read data from or write data to the register that to be accessed in 16-bit units, set an even value of 2 or greater to the DTBLSj (j = 0 to 23) register.

The DTC performs accesses in 16-bit units.

### 15.3.10 DTC Activation Source Acknowledgement and Interrupt Source Flags

#### 15.3.10.1 Interrupt Sources Except for Flash Memory and Timer RC

When the DTC activation source is an interrupt source except for the flash memory or timer RC, the same DTC activation source cannot be acknowledged for 8 to 12 cycles of the CPU clock after the interrupt source is generated. If an interrupt source is generated when a software command is executed, the same DTC activation source cannot be acknowledged for 9 to 16 cycles of the CPU clock. If a DTC activation source is generated during DTC operation and acknowledged, the same DTC activation source cannot be acknowledged for 8 to 12 cycles of the CPU clock on completion of the DTC transfer immediately before the DTC is activated by the source. When a software command is executed on completion of the DTC transfer immediately before the DTC is activated, the same DTC activation source cannot be acknowledged for 16 cycles of the CPU clock.

#### 15.3.10.2 Flash Memory

When the DTC activation source is flash ready status, even if a flash ready status interrupt request is generated, it is not acknowledged as the DTC activation source after the RDYSTI bit in the FST register is set to 1 (flash ready status interrupt request) and before the DTC sets the RDYSTI bit to 0 (no flash ready status interrupt request). If a flash ready status interrupt request is generated after the DTC sets the RDYSTI bit to 0, the DTC acknowledges it as the activation source. 8 to 12 cycles of the CPU clock are required after the RDYSTI bit is set to 1 and before the DTC sets the interrupt request flag to 0. If a flash ready status interrupt is generated when a software command is executed, 9 to 16 cycles of the CPU clock are required before the DTC sets the interrupt source flag to 0. If a flash ready status interrupt request is generated during DTC operation and acknowledged as the DTC activation source, the RDYSTI bit is set to 0 after 8 to 12 cycles of the CPU clock on completion of the DTC transfer immediately before the DTC is activated by the source. When a software command is executed on completion of the DTC transfer immediately before the DTC is activated, the RDYSTI bit is set to 0 after 16 cycles of the CPU clock.

#### 15.3.10.3 Timer RC

When the DTC activation source is an interrupt source for timer RC, even if an input capture/compare match occurs, it is not acknowledged as the DTC activation source after the interrupt source flag is set to 1 and before the DTC sets the flag to 0. If an input capture/compare match occurs after the DTC sets the interrupt source flag to 0, the DTC acknowledges it as the activation source. 8 to 12 cycles of the CPU clock plus 0.5 to 1.5 cycles of the timer operating clock are required after the interrupt source flag is set to 1 and before the DTC sets the flag to 0. If the interrupt request flag is set to 1 when a software command is executed, 9 to 16 cycles of the CPU clock plus 0.5 to 1.5 cycles of the timer operating clock are required before the DTC sets the interrupt source flag to 0. If individual DTC activation sources are generated for timer RC during DTC operation and acknowledged, the interrupt source flag is set to 0 after 8 to 12 cycles of the CPU clock plus 0.5 to 1.5 cycles of the timer operating clock on completion of the DTC transfer immediately before the DTC is activated by the source. When a software command is executed on completion of the DTC transfer immediately before the DTC is activated, the interrupt source flag is set to 0 after 16 cycles of the CPU clock plus 0.5 to 1.5 cycles of the timer operating clock.

## 15.4 Notes on DTC

### 15.4.1 DTC activation source

- Do not generate any DTC activation sources before entering wait mode or during wait mode.
- Do not generate any DTC activation sources before entering stop mode or during stop mode.

### 15.4.2 DTCENi (i = 0 to 3, 5, 6) Registers

- Modify bits DTCENi0 to DTCENi7 only while an interrupt request corresponding to the bit is not generated.
- When the interrupt source flag in the status register for the peripheral function is 1, do not modify the corresponding activation source bit among bits DTCENi0 to DTCENi7.
- Do not access the DTCENi registers using DTC transfers.

### 15.4.3 Peripheral Modules

Do not set the status register bit for the peripheral function to 0 using a DTC transfer.

### 15.4.4 Interrupt Request

No interrupt is generated for the CPU during DTC operation in any of the following cases:

- When the DTC activation source is flash ready status
- When performing the data transfer causing the DTCCTj (j = 0 to 23) register value to change to 0 in normal mode
- When performing the data transfer causing the DTCCRj register value to change to 0 while the RPTINT bit in the DTCCRj register is 1 (interrupt generation enabled) in repeat mode

## 16. General Overview of Timers

The MCU has two 8-bit timers with 8-bit prescalers and a 16-bit timer. The two 8-bit timers with 8-bit prescalers are timer RA and timer RB. These timers contain a reload register to store the default value of the counter. The 16-bit timers are timer RC, and have input capture and output compare functions. All the timers operate independently.

Table 16.1 lists Functional Comparison of Timers.

**Table 16.1 Functional Comparison of Timers**

Item		Timer RA	Timer RB	Timer RC
Configuration		8-bit timer with 8-bit prescaler (with reload register)	8-bit timer with 8-bit prescaler (with reload register)	16-bit timer (with input capture and output compare)
Count		Decrement	Decrement	Increment
Count sources		<ul style="list-style-type: none"> <li>• f1</li> <li>• f2</li> <li>• f8</li> <li>• fOCO</li> </ul>	<ul style="list-style-type: none"> <li>• f1</li> <li>• f2</li> <li>• f8</li> <li>• Timer RA underflow</li> </ul>	<ul style="list-style-type: none"> <li>• f1</li> <li>• f2</li> <li>• f4</li> <li>• f8</li> <li>• f32</li> <li>• fOCO40M</li> <li>• fOCO-F</li> <li>• TRCCLK</li> </ul>
Function	Count of the internal count source	Timer mode	Timer mode	Timer mode (output compare function)
	Count of the external count source	Event counter mode	—	Timer mode (output compare function)
	External pulse width/period measurement	Pulse width measurement mode, pulse period measurement mode	—	Timer mode (input capture function; 4 pins)
	PWM output	Pulse output mode <sup>(1)</sup> , Event counter mode <sup>(1)</sup>	Programmable waveform generation mode	Timer mode (output compare function; 4 pins) <sup>(1)</sup> , PWM mode (3 pins), PWM2 mode (1 pin)
	One-shot waveform output	—	Programmable one-shot generation mode, Programmable wait one-shot generation mode	PWM mode (3 pins)
	Three-phase waveforms output	—	—	—
	Timer	—	—	—
Input pin		TRAIO	INT0	INT0, TRCCLK, TRCTRG, TRCIOA, TRCIOB, TRCIOC, TRCIOD
Output pin		TRA0 TRAIO	TRBO	TRCIOA, TRCIOB, TRCIOC, TRCIOD
Related interrupt		Timer RA interrupt	Timer RB interrupt, INT0 interrupt	Compare match/input capture A to D interrupt, Overflow interrupt, INT0 interrupt
Timer stop		Provided	Provided	Provided

Note:

1. Rectangular waves are output in these modes. Since the waves are inverted at each overflow, the “H” and “L” level widths of the pulses are the same.

## 17. Timer RA

Timer RA is an 8-bit timer with an 8-bit prescaler.

### 17.1 Overview

The prescaler and timer each consist of a reload register and counter. The reload register and counter are allocated at the same address, and can be accessed when accessing registers TRAPRE and TRA (refer to **Tables 17.2 to 17.6 the Specification of Each Modes**).

The count source for timer RA is the operating clock that regulates the timing of timer operations such as counting and reloading.

Figure 17.1 shows a Timer RA Block Diagram. Table 17.1 lists Pin Configuration of Timer RA.

Timer RA contains the following five operating modes:

- Timer mode: The timer counts the internal count source.
- Pulse output mode: The timer counts the internal count source and outputs pulses which invert the polarity by underflow of the timer.
- Event counter mode: The timer counts external pulses.
- Pulse width measurement mode: The timer measures the pulse width of an external pulse.
- Pulse period measurement mode: The timer measures the pulse period of an external pulse.

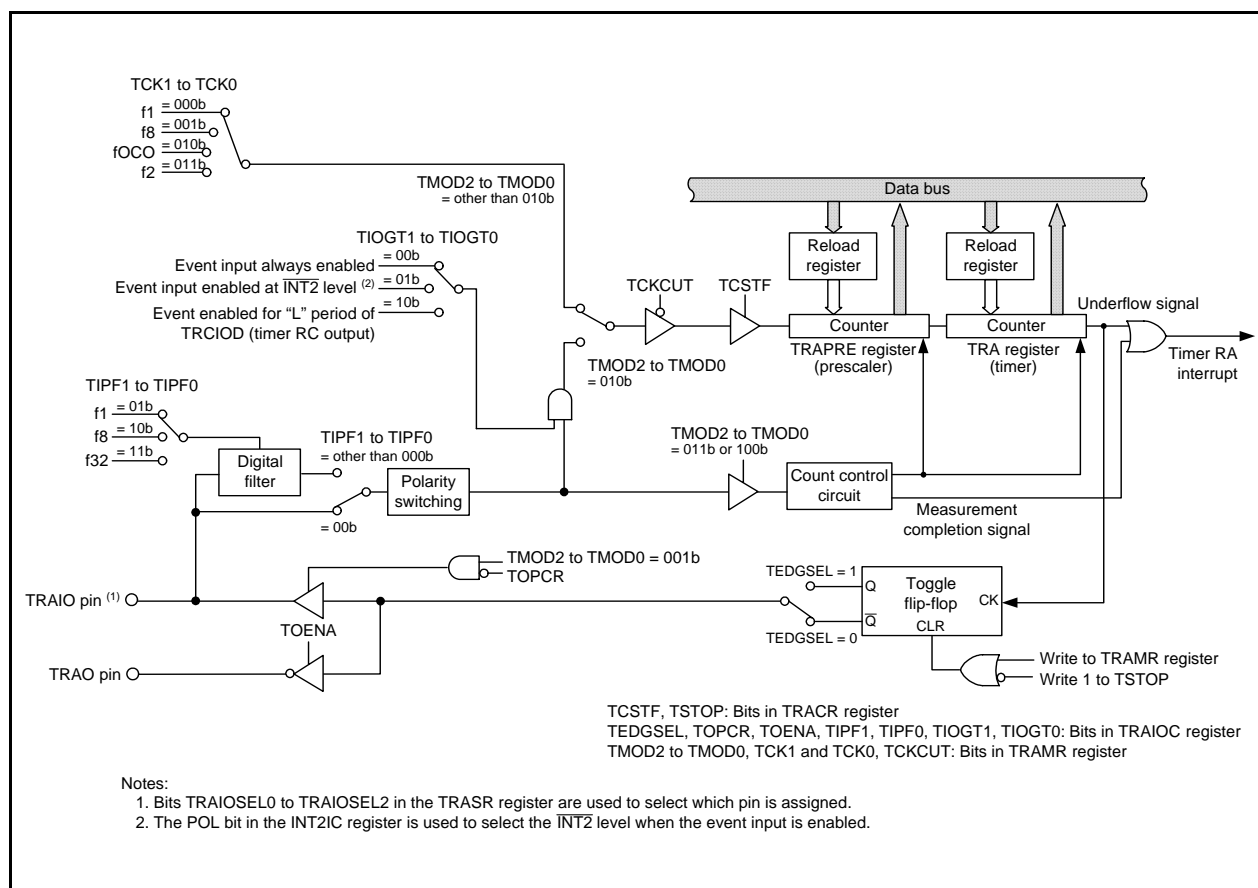

Figure 17.1 Timer RA Block Diagram

Table 17.1 Pin Configuration of Timer RA

Pin Name	Assigned Pin	I/O	Function
TRAIO	P1_5, P1_7 or P3_5	I/O	Function differs according to the mode. Refer to descriptions of individual modes for details.
TRA0	P3_7	Output	

## 17.2 Registers

### 17.2.1 Timer RA Control Register (TRACR)

Address 0100h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	TUNDF	TEDGF	—	TSTOP	TCSTF	TSTART
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	TSTART	Timer RA count start bit <sup>(1)</sup>	0: Count stops 1: Count starts	R/W
b1	TCSTF	Timer RA count status flag <sup>(1)</sup>	0: Count stops 1: During count	R
b2	TSTOP	Timer RA count forcible stop bit <sup>(2)</sup>	When this bit is set to 1, the count is forcibly stopped. When read, its content is 0.	R/W
b3	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b4	TEDGF	Active edge judgment flag <sup>(3, 4)</sup>	0: Active edge not received 1: Active edge received (end of measurement period)	R/W
b5	TUNDF	Timer RA underflow flag <sup>(3, 4)</sup>	0: No underflow 1: Underflow	R/W
b6	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b7	—			

Notes:

1. Refer to **17.8 Notes on Timer RA** for precautions regarding bits TSTART and TCSTF.
2. When the TSTOP bit is set to 1, bits TSTART and TCSTF and registers TRAPRE and TRA are set to the values after a reset.
3. Bits TEDGF and TUNDF can be set to 0 by writing 0 to these bits by a program. However, their value remains unchanged when 1 is written.
4. Set to 0 in timer mode, pulse output mode, and event counter mode.

In pulse width measurement mode and pulse period measurement mode, use the MOV instruction to set the TRACR register. If it is necessary to avoid changing the values of bits TEDGF and TUNDF, write 1 to them.

### 17.2.2 Timer RA I/O Control Register (TRAIOC)

Address 0101h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	TIOGT1	TIOGT0	TIPF1	TIPF0	TIOSEL	TOENA	TOPCR	TEDGSEL
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	TEDGSEL	TRAIO polarity switch bit	Function varies according to the operating mode.	R/W
b1	TOPCR	TRAIO output control bit		R/W
b2	TOENA	TRAO output enable bit		R/W
b3	TIOSEL	Hardware LIN function select bit		R/W
b4	TIPF0	TRAIO input filter select bit		R/W
b5	TIPF1			R/W
b6	TIOGT0	TRAIO event input control bit		R/W
b7	TIOGT1			R/W

### 17.2.3 Timer RA Mode Register (TRAMR)

Address 0102h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	TCKCUT	—	TCK1	TCK0	—	TMOD2	TMOD1	TMOD0
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	TMOD0	Timer RA operating mode select bit	b2 b1 b0 0 0 0: Timer mode 0 0 1: Pulse output mode 0 1 0: Event counter mode 0 1 1: Pulse width measurement mode 1 0 0: Pulse period measurement mode 1 0 1: Do not set. 1 1 0: Do not set. 1 1 1: Do not set.	R/W
b1	TMOD1			R/W
b2	TMOD2			R/W
b3	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b4	TCK0	Timer RA count source select bit	b5 b4 0 0: f1 0 1: f8 1 0: fOCO 1 1: f2	R/W
b5	TCK1			R/W
b6	—	Reserved bit	Set to 0.	R/W
b7	TCKCUT	Timer RA count source cutoff bit	0: Provides count source 1: Cuts off count source	R/W

When both the TSTART and TCSTF bits in the TRACR register are set to 0 (count stops), rewrite this register.

### 17.2.4 Timer RA Prescaler Register (TRAPRE)

Address 0103h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	—	—	—	—
After Reset	1	1	1	1	1	1	1	1

(Note 1)

Bit	Mode	Function	Setting Range	R/W
b7 to b0	Timer mode	Counts an internal count source	00h to FFh	R/W
	Pulse output mode		00h to FFh	R/W
	Event counter mode	Counts an external count source	00h to FFh	R/W
	Pulse width measurement mode	Measure pulse width of input pulses from external (counts internal count source)	00h to FFh	R/W
	Pulse period measurement mode	Measure pulse period of input pulses from external (counts internal count source)	00h to FFh	R/W

Note:

- When the TSTOP bit in the TRACR register is set to 1, the TRAPRE register is set to FFh.

### 17.2.5 Timer RA Register (TRA)

Address 0104h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	—	—	—	—
After Reset	1	1	1	1	1	1	1	1 (Note 1)

Bit	Mode	Function	Setting Range	R/W
b7 to b0	All modes	Counts on underflow of TRAPRE register	00h to FFh	R/W

Note:

- When the TSTOP bit in the TRACR register is set to 1, the TRAPRE register is set to FFh.

### 17.2.6 Timer RA Pin Select Register (TRASR)

Address 0180h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	—	TRAIOSEL2	TRAIOSEL1	TRAIOSEL0
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	TRAIOSEL0	TRAIO pin select bit	b2 b1 b0 0 0 0: TRATIO pin not used 0 0 1: P1_7 assigned 0 1 0: P1_5 assigned 0 1 1: Do not set. 1 0 0: Do not set. 1 0 1: P3_5 assigned Other than above: Do not set.	R/W
b1	TRAIOSEL1			R/W
b2	TRAIOSEL2			R/W
b3	—	Reserved bits	Set to 0.	R/W
b4	—			
b5	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b6	—			
b7	—			

The TRASR register selects which pin is assigned to the timer RA I/O. To use the I/O pin for timer RA, set this register.

Set the TRASR register before setting the timer RA associated registers. Also, do not change the setting value in this register during timer RA operation.

### 17.3 Timer Mode

In this mode, the timer counts an internally generated count source (refer to **Table 17.2 Timer Mode Specifications**).

**Table 17.2 Timer Mode Specifications**

Item	Specification
Count sources	f1, f2, f8, fOCO
Count operations	<ul style="list-style-type: none"> <li>Decrement</li> <li>When the timer underflows, the contents of the reload register are reloaded and the count is continued.</li> </ul>
Divide ratio	$1/(n+1)(m+1)$ n: Value set in TRAPRE register, m: Value set in TRA register
Count start condition	1 (count starts) is written to the TSTART bit in the TRACR register.
Count stop conditions	<ul style="list-style-type: none"> <li>0 (count stops) is written to the TSTART bit in the TRACR register.</li> <li>1 (count forcibly stops) is written to the TSTOP bit in the TRACR register.</li> </ul>
Interrupt request generation timing	When timer RA underflows [timer RA interrupt].
TRAIO pin function	Programmable I/O port
TRA0 pin function	Programmable I/O port
Read from timer	The count value can be read by reading registers TRA and TRAPRE.
Write to timer	<ul style="list-style-type: none"> <li>When registers TRAPRE and TRA are written while the count is stopped, values are written to both the reload register and counter.</li> <li>When registers TRAPRE and TRA are written during the count, values are written to the reload register and counter (refer to <b>17.3.2 Timer Write Control during Count Operation</b>).</li> </ul>

#### 17.3.1 Timer RA I/O Control Register (TRAIOC) in Timer Mode

Address 0101h

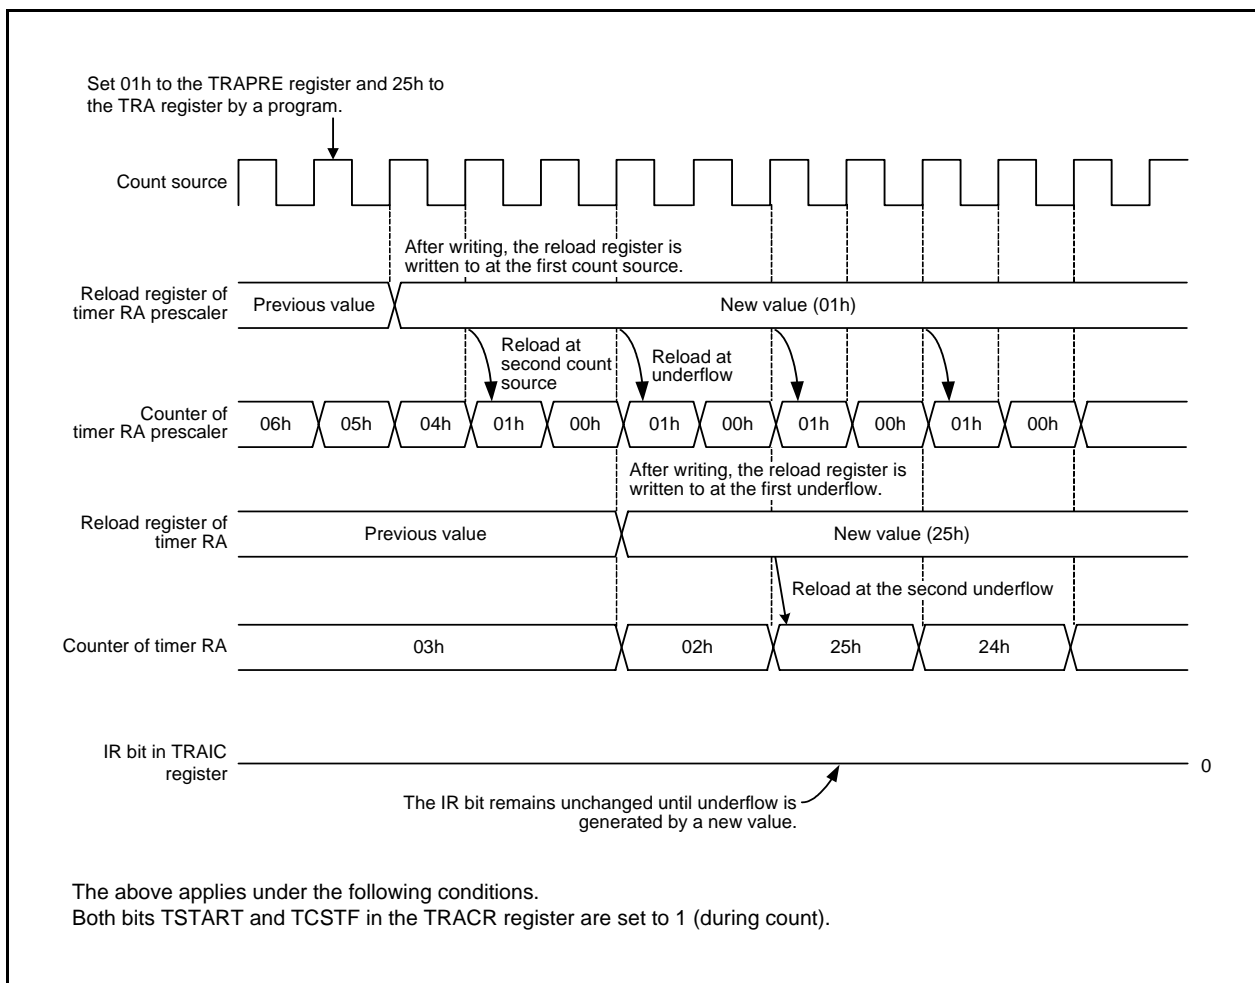

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	TIOGT1	TIOGT0	TIPF1	TIPF0	TIOSEL	TOENA	TOPCR	TEDGSEL
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	TEDGSEL	TRAIO polarity switch bit	Set to 0 in timer mode.	R/W
b1	TOPCR	TRAIO output control bit		R/W
b2	TOENA	TRA0 output enable bit		R/W
b3	TIOSEL	Hardware LIN function select bit	Set to 0. However, set to 1 when the hardware LIN function is used.	R/W
b4	TIPF0	TRAIO input filter select bit	Set to 0 in timer mode.	R/W
b5	TIPF1			R/W
b6	TIOGT0	TRAIO event input control bit		R/W
b7	TIOGT1			R/W

### 17.3.2 Timer Write Control during Count Operation

Timer RA has a prescaler and a timer (which counts the prescaler underflows). The prescaler and timer each consist of a reload register and a counter. When writing to the prescaler or timer, values are written to both the reload register and counter.

However, values are transferred from the reload register to the counter of the prescaler in synchronization with the count source. In addition, values are transferred from the reload register to the counter of the timer in synchronization with prescaler underflows. Therefore, if the prescaler or timer is written to when count operation is in progress, the counter value is not updated immediately after the WRITE instruction is executed. Figure 17.2 shows an Operating Example of Timer RA when Counter Value is Rewritten during Count Operation.

**Figure 17.2** Operating Example of Timer RA when Counter Value is Rewritten during Count Operation

## 17.4 Pulse Output Mode

In pulse output mode, the internally generated count source is counted, and a pulse with inverted polarity is output from the TRAIO pin each time the timer underflows (refer to **Table 17.3 Pulse Output Mode Specifications**).

**Table 17.3 Pulse Output Mode Specifications**

Item	Specification
Count sources	f1, f2, f8, fOCO
Count operations	<ul style="list-style-type: none"> <li>• Decrement</li> <li>• When the timer underflows, the contents in the reload register is reloaded and the count is continued.</li> </ul>
Divide ratio	$1/(n+1)(m+1)$ n: Value set in TRAPRE register, m: Value set in TRA register
Count start condition	1 (count starts) is written to the TSTART bit in the TRACR register.
Count stop conditions	<ul style="list-style-type: none"> <li>• 0 (count stops) is written to the TSTART bit in the TRACR register.</li> <li>• 1 (count forcibly stops) is written to the TSTOP bit in the TRACR register.</li> </ul>
Interrupt request generation timing	When timer RA underflows [timer RA interrupt].
TRAIO pin function	Pulse output, programmable output port
TRAO pin function	Programmable I/O port or inverted output of TRAIO
Read from timer	The count value can be read by reading registers TRA and TRAPRE.
Write to timer	<ul style="list-style-type: none"> <li>• When registers TRAPRE and TRA are written while the count is stopped, values are written to both the reload register and counter.</li> <li>• When registers TRAPRE and TRA are written during the count, values are written to the reload register and counter (refer to <b>17.3.2 Timer Write Control during Count Operation</b>).</li> </ul>
Selectable functions	<ul style="list-style-type: none"> <li>• TRAIO signal polarity switch function The level when the pulse output starts is selected by the TEDGSEL bit in the TRAIOC register. <sup>(1)</sup></li> <li>• TRAO output function Pulses inverted from the TRAIO output polarity can be output from the TRAO pin (selectable by the TOENA bit in the TRAIOC register).</li> <li>• Pulse output stop function Output from the TRAIO pin is stopped by the TOPCR bit in the TRAIOC register.</li> <li>• TRAIO pin select function P1_5, P1_7, or P3_5 is selected by bits TRAIOSSEL0 to TRAIOSSEL2 in the TRASR register.</li> </ul>

Note:

1. The level of the output pulse becomes the level when the pulse output starts when the TRAMR register is written to.

### 17.4.1 Timer RA I/O Control Register (TRAIOC) in Pulse Output Mode

Address 0101h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	TIOGT1	TIOGT0	TIPF1	TIPF0	TIOSEL	TOENA	TOPCR	TEDGSEL

## 17.5 Event Counter Mode

In event counter mode, external signal inputs to the TRAI0 pin are counted (refer to **Table 17.4 Event Counter Mode Specifications**).

**Table 17.4 Event Counter Mode Specifications**

Item	Specification
Count source	External signal which is input to TRAI0 pin (active edge selectable by a program)
Count operations	<ul style="list-style-type: none"> <li>• Decrement</li> <li>• When the timer underflows, the contents of the reload register are reloaded and the count is continued.</li> </ul>
Divide ratio	$1/(n+1)(m+1)$ n: setting value of TRAPRE register, m: setting value of TRA register
Count start condition	1 (count starts) is written to the TSTART bit in the TRACR register.
Count stop conditions	<ul style="list-style-type: none"> <li>• 0 (count stops) is written to the TSTART bit in the TRACR register.</li> <li>• 1 (count forcibly stops) is written to the TSTOP bit in the TRACR register.</li> </ul>
Interrupt request generation timing	When timer RA underflows [timer RA interrupt].
TRAIO pin function	Count source input
TRAO pin function	Programmable I/O port or pulse output <sup>(1)</sup>
Read from timer	The count value can be read by reading registers TRA and TRAPRE.
Write to timer	<ul style="list-style-type: none"> <li>• When registers TRAPRE and TRA are written while the count is stopped, values are written to both the reload register and counter.</li> <li>• When registers TRAPRE and TRA are written during the count, values are written to the reload register and counter (refer to <b>17.3.2 Timer Write Control during Count Operation</b>).</li> </ul>
Selectable functions	<ul style="list-style-type: none"> <li>• TRAI0 input polarity switch function The active edge of the count source is selected by the TEDGSEL bit in the TRAI0C register.</li> <li>• Count source input pin select function P1_5, P1_7, or P3_5 is selected by bits TRAI0SEL0 to TRAI0SEL2 in the TRASR register.</li> <li>• Pulse output function Pulses of inverted polarity can be output from the TRAO pin each time the timer underflows (selectable by the TOENA bit in the TRAI0C register). <sup>(1)</sup></li> <li>• Digital filter function Whether enabling or disabling the digital filter and the sampling frequency is selected by bits TIPF0 and TIPF1 in the TRAI0C register.</li> <li>• Event input control function The enabled period for the event input to the TRAI0 pin is selected by bits TIOGT0 and TIOGT1 in the TRAI0C register.</li> </ul>

Note:

1. The level of the output pulse becomes the level when the pulse output starts when the TRAMR register is written to.

### 17.5.1 Timer RA I/O Control Register (TRAIOC) in Event Counter Mode

Address 0101h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	TIOGT1	TIOGT0	TIPF1	TIPF0	TIOSEL	TOENA	TOPCR	TEDGSEL
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	TEDGSEL	TRAIO polarity switch bit	0: Starts counting at rising edge of the TRAIO input and TRAIO starts output at "L" 1: Starts counting at falling edge of the TRAIO input and TRAIO starts output at "H"	R/W
b1	TOPCR	TRAIO output control bit	Set to 0 in event counter mode.	R/W
b2	TOENA	TRAIO output enable bit	0: TRAIO output disabled 1: TRAIO output	R/W
b3	TIOSEL	Hardware LIN function select bit	Set to 0.	R/W
b4	TIPF0	TRAIO input filter select bit <sup>(1)</sup>	b5 b4 0 0: No filter 0 1: Filter with f1 sampling 1 0: Filter with f8 sampling 1 1: Filter with f32 sampling	R/W
b5	TIPF1			R/W
b6	TIOGT0	TRAIO event input control bit	b7 b6 0 0: Event input always enabled 0 1: Event input enabled at $\overline{\text{INT2}}$ level <sup>(2)</sup> 1 0: Event input enabled for "L" period of TRCIOD (timer RC output) 1 1: Do not set.	R/W
b7	TIOGT1			R/W

Notes:

- When the same value from the TRAIO pin is sampled three times continuously, the input is determined.
- Make the following settings to use event input enabled at  $\overline{\text{INT2}}$  level:
  - Set the INT2EN bit in the INTEN register to 1 ( $\overline{\text{INT2}}$  input enabled) and the INT2PL bit to 0 (one edge).
  - Set the  $\overline{\text{INT2}}$  polarity by the POL bit in the INT2IC register.  
When the POL bit is set 0 (falling edge selected), the event input for the  $\overline{\text{INT2}}$  high-level period is enabled.  
When the POL bit is set 1 (rising edge selected), the event input for the  $\overline{\text{INT2}}$  low-level period is enabled.
  - Set the PD3\_2 bit in the PD3 register for the port assigned as the  $\overline{\text{INT2}}$  pin to 0 (input mode).
  - Select the  $\overline{\text{INT2}}$  digital filter by bits INT2F1 to INT2F0 in the INTF register.

The IR bit in the INT2IC register is set to 1 (interrupt request) in accordance with the setting of the POL bit in the INT2IC register and the INT2PL bit in the INTEN register and a change in the  $\overline{\text{INT2}}$  pin input (refer to **11.9 Notes on Interrupts**).

For details on interrupts, refer to **11. Interrupts**.

## 17.6 Pulse Width Measurement Mode

In pulse width measurement mode, the pulse width of an external signal input to the TRAI0 pin is measured (refer to **Table 17.5 Pulse Width Measurement Mode Specifications**).

Figure 17.3 shows an Operating Example of Pulse Width Measurement Mode.

**Table 17.5 Pulse Width Measurement Mode Specifications**

Item	Specification
Count sources	f1, f2, f8, fOCO
Count operations	<ul style="list-style-type: none"> <li>• Decrement</li> <li>• Continuously counts the selected signal only when measurement pulse is “H” level, or conversely only “L” level.</li> <li>• When the timer underflows, the contents of the reload register are reloaded and the count is continued.</li> </ul>
Count start condition	1 (count starts) is written to the TSTART bit in the TRACR register.
Count stop conditions	<ul style="list-style-type: none"> <li>• 0 (count stops) is written to the TSTART bit in the TRACR register.</li> <li>• 1 (count forcibly stops) is written to the TSTOP bit in the TRACR register.</li> </ul>
Interrupt request generation timing	<ul style="list-style-type: none"> <li>• When timer RA underflows [timer RA interrupt].</li> <li>• Rising or falling of the TRAI0 input (end of measurement period) [timer RA interrupt].</li> </ul>
TRAIO pin function	Measured pulse input
TRAO pin function	Programmable I/O port
Read from timer	The count value can be read by reading registers TRA and TRAPRE.
Write to timer	<ul style="list-style-type: none"> <li>• When registers TRAPRE and TRA are written while the count is stopped, values are written to both the reload register and counter.</li> <li>• When registers TRAPRE and TRA are written during the count, values are written to the reload register and counter (refer to <b>17.3.2 Timer Write Control during Count Operation</b>).</li> </ul>
Selectable functions	<ul style="list-style-type: none"> <li>• Measurement level setting The “H” level or “L” level period is selected by the TEDGSEL bit in the TRAI0C register.</li> <li>• Measured pulse input pin select function P1_5, P1_7, or P3_5 is selected by bits TRAI0SEL0 to TRAI0SEL2 in the TRASR register.</li> <li>• Digital filter function Whether enabling or disabling the digital filter and the sampling frequency is selected by bits TIPF0 and TIPF1 in the TRAI0C register.</li> </ul>

### 17.6.1 Timer RA I/O Control Register (TRAIOC) in Pulse Width Measurement Mode

Address 0101h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	TIOGT1	TIOGT0	TIPF1	TIPF0	TIOSEL	TOENA	TOPCR	TEDGSEL

b0	TEDGSEL	TRAIO polarity switch bit	0: TRAIO input starts at "L" 1: TRAIO input starts at "H"	R/W
b1	TOPCR	TRAIO output control bit	Set to 0 in pulse width measurement mode.	R/W
b2	TOENA	TRAIO output enable bit		R/W
b3	TIOSEL	Hardware LIN function select bit		R/W
b4	TIPF0	TRAIO input filter select bit <sup>(1)</sup>	b5 b4 0 0: No filter 0 1: Filter with f1 sampling 1 0: Filter with f8 sampling 1 1: Filter with f32 sampling	R/W
b5	TIPF1			R/W
b6	TIOGT0	TRAIO event input control bit	Set to 0 in pulse width measurement mode.	R/W
b7	TIOGT1			R/W

Note:

1. When the same value from the TRAIO pin is sampled three times continuously, the input is determined.

## 17.6.2 Operating Example

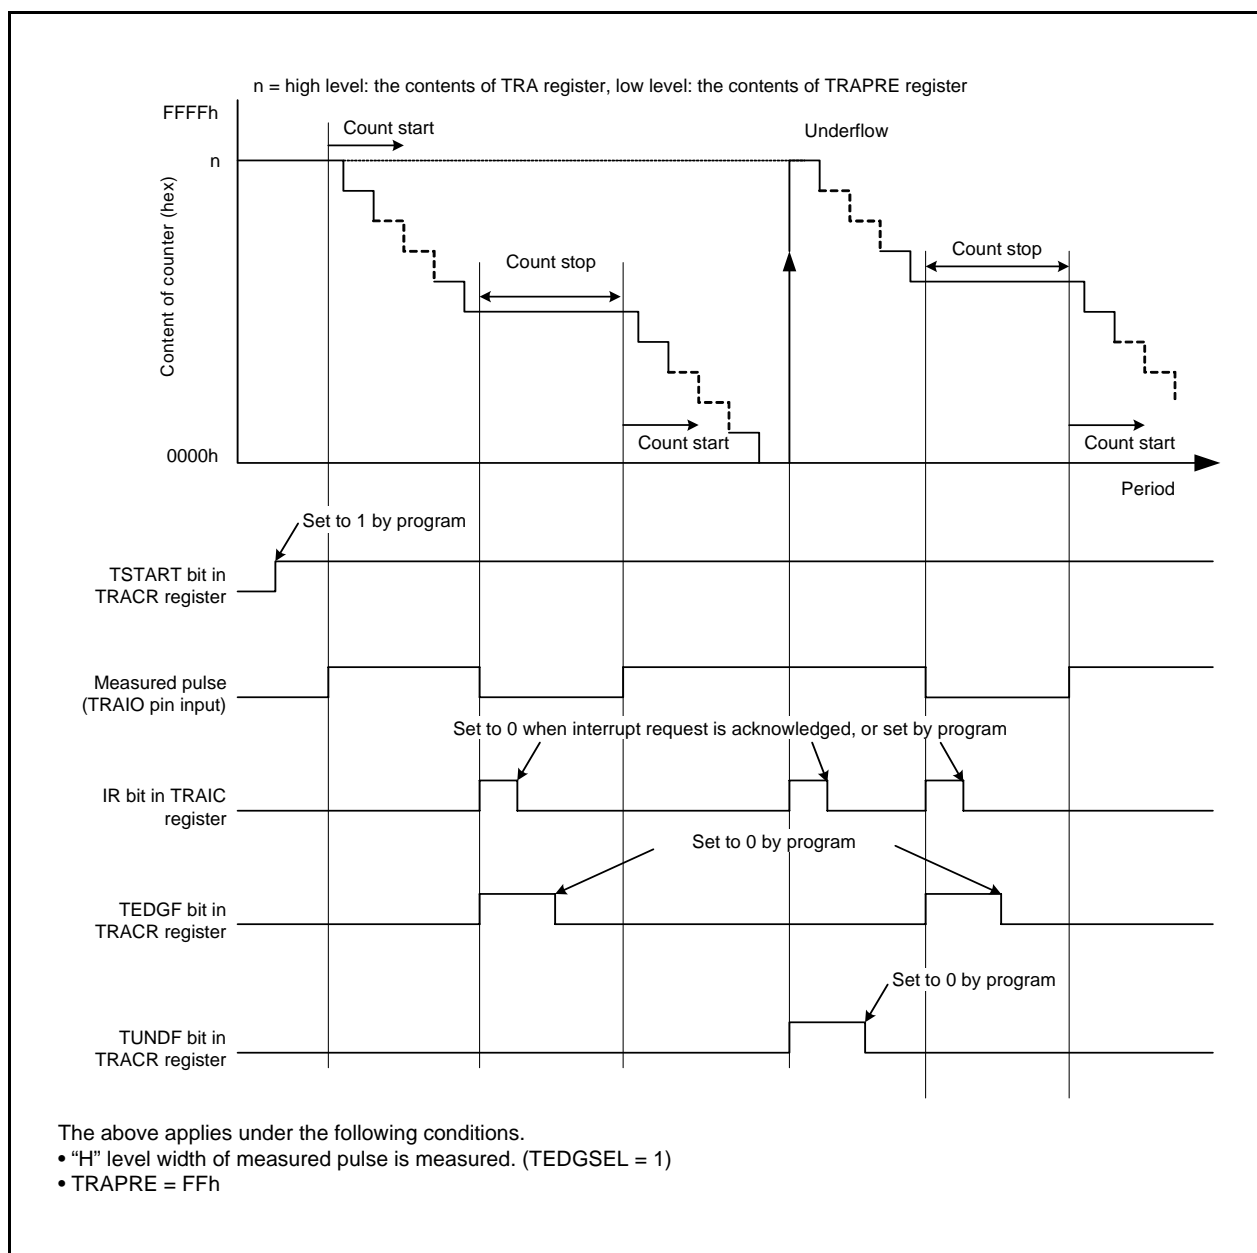

Figure 17.3 Operating Example of Pulse Width Measurement Mode

## 17.7 Pulse Period Measurement Mode

In pulse period measurement mode, the pulse period of an external signal input to the TRAI0 pin is measured (refer to **Table 17.6 Pulse Period Measurement Mode Specifications**).

Figure 17.4 shows an Operating Example of Pulse Period Measurement Mode.

**Table 17.6 Pulse Period Measurement Mode Specifications**

Item	Specification
Count sources	f1, f2, f8, fOCO
Count operations	<ul style="list-style-type: none"> <li>Decrement</li> <li>After the active edge of the measured pulse is input, the contents of the read-out buffer are retained at the first underflow of timer RA prescaler. Then timer RA reloads the contents in the reload register at the second underflow of timer RA prescaler and continues counting.</li> </ul>
Count start condition	1 (count starts) is written to the TSTART bit in the TRACR register.
Count stop conditions	<ul style="list-style-type: none"> <li>0 (count stops) is written to TSTART bit in the TRACR register.</li> <li>1 (count forcibly stops) is written to the TSTOP bit in the TRACR register.</li> </ul>
Interrupt request generation timing	<ul style="list-style-type: none"> <li>When timer RA underflows or reloads [timer RA interrupt].</li> <li>Rising or falling of the TRAI0 input (end of measurement period) [timer RA interrupt].</li> </ul>
TRAI0 pin function	Measured pulse input <sup>(1)</sup>
TRAO pin function	Programmable I/O port
Read from timer	The count value can be read by reading registers TRA and TRAPRE.
Write to timer	<ul style="list-style-type: none"> <li>When registers TRAPRE and TRA are written while the count is stopped, values are written to both the reload register and counter.</li> <li>When registers TRAPRE and TRA are written during the count, values are written to the reload register and counter (refer to <b>17.3.2 Timer Write Control during Count Operation</b>).</li> </ul>
Selectable functions	<ul style="list-style-type: none"> <li>Measurement period selection The measurement period of the input pulse is selected by the TEDGSEL in the TRAI0C register.</li> <li>Measured pulse input pin select function P1_5, P1_7, or P3_5 is selected by bits TRAI0SEL0 to TRAI0SEL2 in the TRASR register.</li> <li>Digital filter function Whether enabling or disabling the digital filter and the sampling frequency is selected by bits TIPF0 and TIPF1 in the TRAI0C register.</li> </ul>

Note:

- Input a pulse with a period longer than twice the timer RA prescaler period. Input a pulse with a longer "H" and "L" width than the timer RA prescaler period. If a pulse with a shorter period is input to the TRAI0 pin, the input may be ignored.

### 17.7.1 Timer RA I/O Control Register (TRAIOC) in Pulse Period Measurement Mode

Address 0101h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	TIOGT1	TIOGT0	TIPF1	TIPF0	—	TOENA	TOPCR	TEDGSEL
After Reset	0	0	0	0	0	0	0	0

b7	TIOGT1			R/W

Note:

1. When the same value from the TRAIO pin is sampled three times continuously, the input is determined.

### 17.7.2 Operating Example

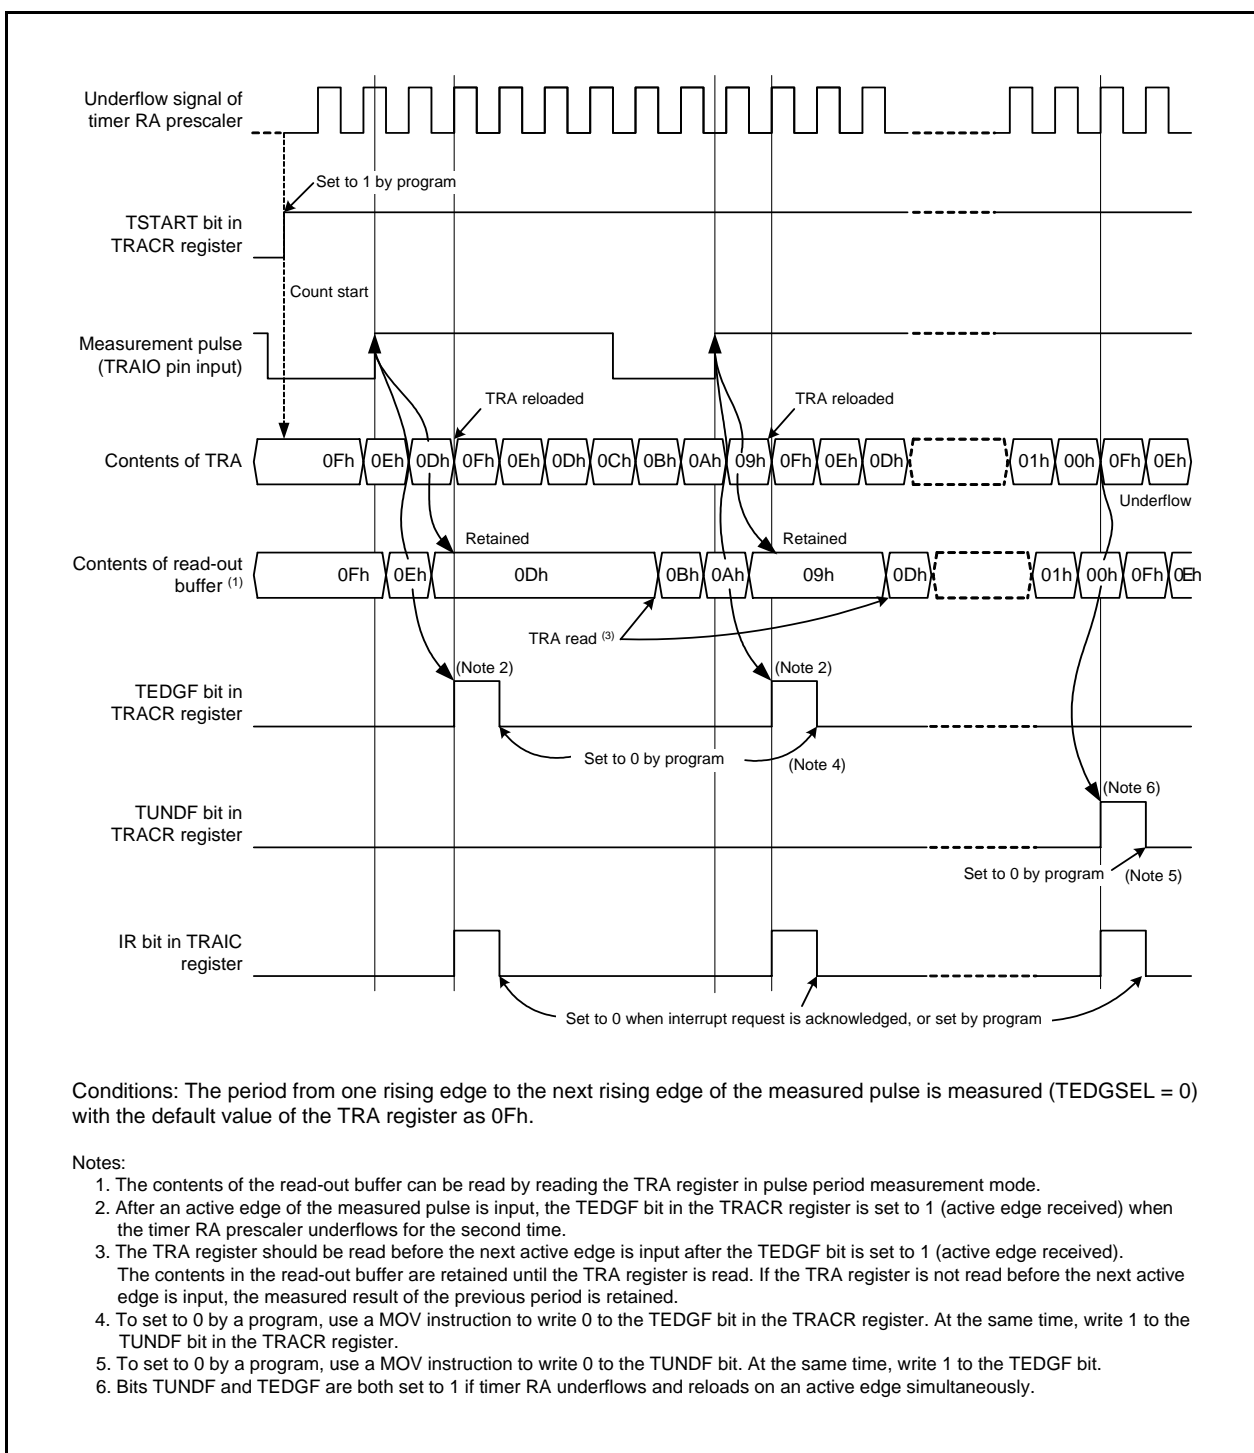

Figure 17.4 Operating Example of Pulse Period Measurement Mode

## 17.8 Notes on Timer RA

- Timer RA stops counting after a reset. Set the values in the timer RA and timer RA prescalers before the count starts.
- Even if the prescaler and timer RA are read out in 16-bit units, these registers are read 1 byte at a time by the MCU. Consequently, the timer value may be updated during the period when these two registers are being read.
- In pulse width measurement mode and pulse period measurement mode, bits TEDGF and TUNDF in the TRACR register can be set to 0 by writing 0 to these bits by a program. However, these bits remain unchanged if 1 is written. When using the READ-MODIFY-WRITE instruction for the TRACR register, the TEDGF or TUNDF bit may be set to 0 although these bits are set to 1 while the instruction is being executed. In this case, write 1 to the TEDGF or TUNDF bit which is not supposed to be set to 0 with the MOV instruction.
- When changing to pulse period measurement mode from another mode, the contents of bits TEDGF and TUNDF are undefined. Write 0 to bits TEDGF and TUNDF before the count starts.
- The TEDGF bit may be set to 1 by the first timer RA prescaler underflow generated after the count starts.
- When using the pulse period measurement mode, leave two or more periods of the timer RA prescaler immediately after the count starts, then set the TEDGF bit to 0.
- The TCSTF bit retains 0 (count stops) for 0 to 1 cycle of the count source after setting the TSTART bit to 1 (count starts) while the count is stopped.

During this time, do not access registers associated with timer RA <sup>(1)</sup> other than the TCSTF bit. Timer RA starts counting at the first valid edge of the count source after the TCSTF bit is set to 1 (during count).

The TCSTF bit remains 1 for 0 to 1 cycle of the count source after setting the TSTART bit to 0 (count stops) while the count is in progress. Timer RA counting is stopped when the TCSTF bit is set to 0.

During this time, do not access registers associated with timer RA <sup>(1)</sup> other than the TCSTF bit.

Note:

1. Registers associated with timer RA: TRACR, TRAIOC, TRAMR, TRAPRE, and TRA.

- When the TRAPRE register is continuously written during count operation (TCSTF bit is set to 1), allow three or more cycles of the count source clock for each write interval.
- When the TRA register is continuously written during count operation (TCSTF bit is set to 1), allow three or more cycles of the prescaler underflow for each write interval.

## 18. Timer RB

Timer RB is an 8-bit timer with an 8-bit prescaler.

## 18.1 Overview

The prescaler and timer each consist of a reload register and counter (refer to **Tables 18.2 to 18.5 the Specifications of Each Mode**). Timer RB has timer RB primary and timer RB secondary as reload registers. The count source for timer RB is the operating clock that regulates the timing of timer operations such as counting and reloading.

Figure 18.1 shows a Timer RB Block Diagram. Table 18.1 lists Pin Configuration of Timer RB.

Timer RB has four operation modes listed as follows:

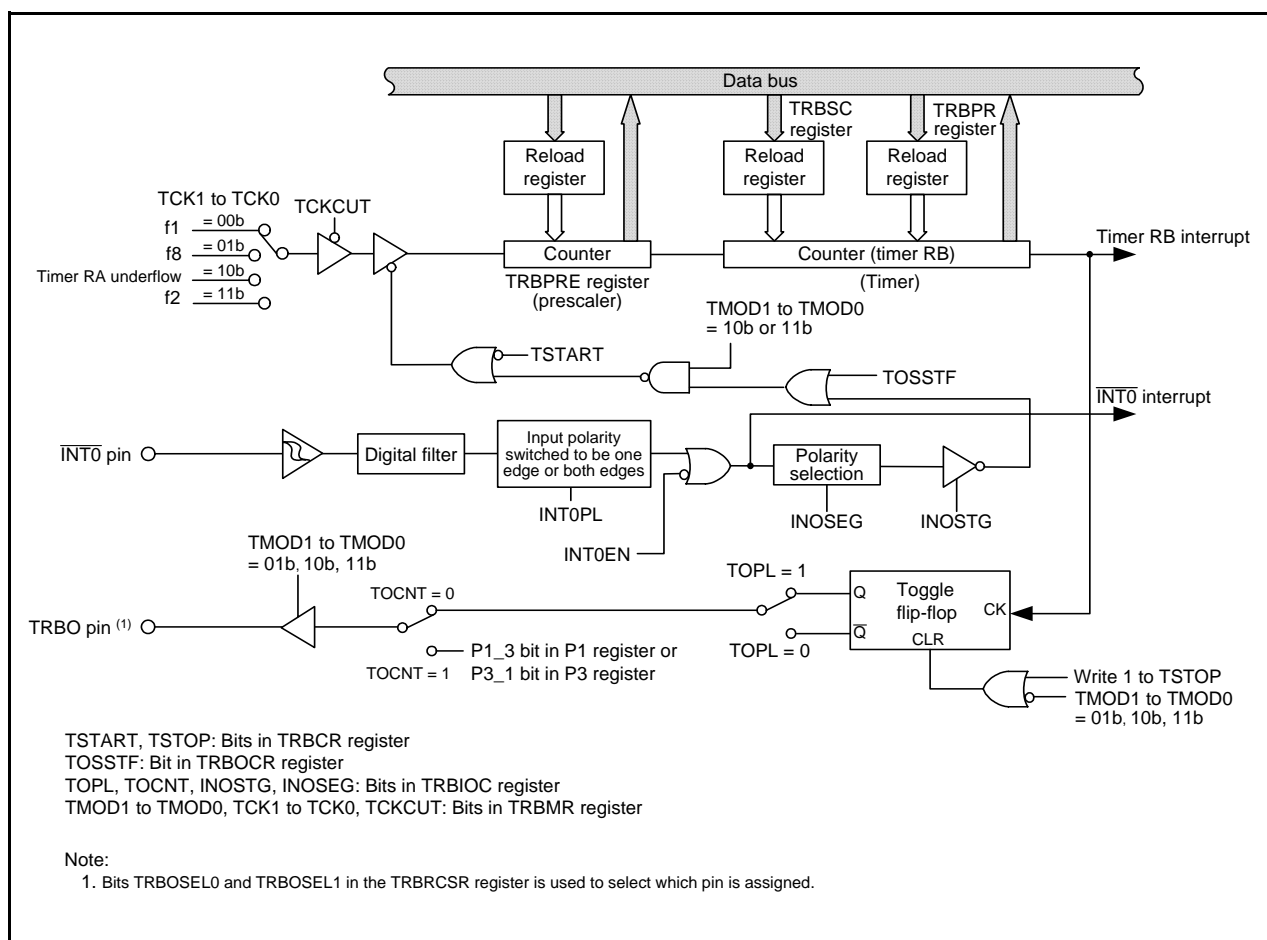

- Timer mode:
- Programmable waveform generation mode:
- Programmable one-shot generation mode:
- Programmable wait one-shot generation mode:

The timer counts an internal count source (peripheral function clock or timer RA underflows).

The timer outputs pulses of a given width successively.

The timer outputs a one-shot pulse.

The timer outputs a delayed one-shot pulse.

**Figure 18.1     Timer RB Block Diagram**

**Table 18.1 Pin Configuration of Timer RB**

Pin Name	Assigned Pin	I/O	Function
TRBO	P1_3, P3_1, or P3_3	Output	Pulse output (programmable waveform generation mode, programmable one-shot generation mode, programmable wait one-shot generation mode)

## 18.2 Registers

### 18.2.1 Timer RB Control Register (TRBCR)

Address 0108h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	—	TSTOP	TCSTF	TSTART
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	TSTART	Timer RB count start bit <sup>(1)</sup>	0: Count stops 1: Count starts	R/W
b1	TCSTF	Timer RB count status flag <sup>(1)</sup>	0: Count stops 1: During count <sup>(3)</sup>	R
b2	TSTOP	Timer RB count forcible stop bit <sup>(1, 2)</sup>	When this bit is set to 1, the count is forcibly stopped. When read, the content is 0.	R/W
b3	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b4	—			
b5	—			
b6	—			
b7	—			

Notes:

1. Refer to **18.7 Notes on Timer RB** for precautions regarding bits TSTART, TCSTF and TSTOP.
2. When the TSTOP bit is set to 1, registers TRBPPE, TRBSC, TRBPR, and bits TSTART and TCSTF, and the TOSSTF bit in the TRBOCR register are set to values after a reset.
3. Indicates that count operation is in progress in timer mode or programmable waveform mode. In programmable one-shot generation mode or programmable wait one-shot generation mode, indicates that a one-shot pulse trigger has been acknowledged.

### 18.2.2 Timer RB One-Shot Control Register (TRBOCR)

Address 0109h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	—	TOSSTF	TOSSP	TOSST
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	TOSST	Timer RB one-shot start bit	When this bit is set to 1, one-shot trigger generated. When read, its content is 0.	R/W
b1	TOSSP	Timer RB one-shot stop bit	When this bit is set to 1, counting of one-shot pulses (including programmable wait one-shot pulses) stops. When read, the content is 0.	R/W
b2	TOSSTF	Timer RB one-shot status flag <sup>(1)</sup>	0: One-shot stopped 1: One-shot operating (Including wait period)	R
b3	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b4	—			
b5	—			
b6	—			
b7	—			

Note:

1. When 1 is set to the TSTOP bit in the TRBCR register, the TOSSTF bit is set to 0.

This register is enabled when bits TMOD1 to TMOD0 in the TRBMR register is set to 10b (programmable one-shot generation mode) or 11b (programmable wait one-shot generation mode).

### 18.2.3 Timer RB I/O Control Register (TRBIOC)

Address 010Ah

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	INOSEG	INOSTG	TOCNT	TOPL
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	TOPL	Timer RB output level select bit	Function varies according to the operating mode.	R/W
b1	TOCNT	Timer RB output switch bit		R/W
b2	INOSTG	One-shot trigger control bit		R/W
b3	INOSEG	One-shot trigger polarity select bit		R/W
b4	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b5	—			
b6	—			
b7	—			

### 18.2.4 Timer RB Mode Register (TRBMR)

Address 010Bh

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	TCKCUT	—	TCK1	TCK0	TWRC	—	TMOD1	TMOD0
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	TMOD0	Timer RB operating mode select bit <sup>(1)</sup>	b1 b0 0 0: Timer mode 0 1: Programmable waveform generation mode 1 0: Programmable one-shot generation mode 1 1: Programmable wait one-shot generation mode	R/W
b1	TMOD1			R/W
b2	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b3	TWRC	Timer RB write control bit <sup>(2)</sup>	0: Write to reload register and counter 1: Write to reload register only	R/W
b4	TCK0	Timer RB count source select bit <sup>(1)</sup>	b5 b4 0 0: f1 0 1: f8 1 0: Timer RA underflow <sup>(3)</sup> 1 1: f2	R/W
b5	TCK1			R/W
b6	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b7	TCKCUT	Timer RB count source cutoff bit <sup>(1)</sup>	0: Provides count source 1: Cuts off count source	R/W

Notes:

1. Change bits TMOD1 and TMOD0; TCK1 and TCK0; and TCKCUT when both the TSTART and TCSTF bits in the TRBCR register set to 0 (count stops).
2. The TWRC bit can be set to either 0 or 1 in timer mode. In programmable waveform generation mode, programmable one-shot generation mode, or programmable wait one-shot generation mode, the TWRC bit must be set to 1 (write to reload register only).
3. To use the underflow signal of timer RA as the count source for timer RB, set timer RA in timer mode, pulse output mode, or event count mode.

### 18.2.5 Timer RB Prescaler Register (TRBPRES)

Address 010Ch

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	—	—	—	—
After Reset	1	1	1	1	1	1	1	1

Bit	Mode	Function	Setting Range	R/W
b7 to b0	Timer mode	Counts an internal count source or timer RA underflows	00h to FFh	R/W
	Programmable waveform generation mode		00h to FFh	R/W
	Programmable one-shot generation mode		00h to FFh	R/W
	Programmable wait one-shot generation mode		00h to FFh	R/W

When the TSTOP bit in the TRBCR register is set to 1, the TRBPRES register is set to FFh.

### 18.2.6 Timer RB Secondary Register (TRBSC)

Address 010Dh

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	—	—	—	—
After Reset	1	1	1	1	1	1	1	1

Bit	Mode	Function	Setting Range	R/W
b7 to b0	Timer mode	Disabled	00h to FFh	—
	Programmable waveform generation mode	Counts timer RB prescaler underflows <sup>(1)</sup>	00h to FFh	W <sup>(2)</sup>
	Programmable one-shot generation mode	Disabled	00h to FFh	—
	Programmable wait one-shot generation mode	Counts timer RB prescaler underflows (one-shot width is counted)	00h to FFh	W <sup>(2)</sup>

Notes:

1. The values of registers TRBPR and TRBSC are reloaded to the counter alternately and counted.
2. The count value can be read out by reading the TRBPR register even when the secondary period is being counted.

When the TSTOP bit in the TRBCR register is set to 1, the TRBSC register is set to FFh.

To write to the TRBSC register, perform the following steps.

- (1) Write the value to the TRBSC register.
- (2) Write the value to the TRBPR register. (If the value does not change, write the same value second time.)

### 18.2.7 Timer RB Primary Register (TRBPR)

Address 010Eh

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	—	—	—	—
After Reset	1	1	1	1	1	1	1	1

Bit	Mode	Function	Setting Range	R/W
b7 to b0	Timer mode	Counts timer RB prescaler underflows	00h to FFh	R/W
	Programmable waveform generation mode	Counts timer RB prescaler underflows <sup>(1)</sup>	00h to FFh	R/W
	Programmable one-shot generation mode	Counts timer RB prescaler underflows (one-shot width is counted)	00h to FFh	R/W
	Programmable wait one-shot generation mode	Counts timer RB prescaler underflows (wait period width is counted)	00h to FFh	R/W

Note:

1. The values of registers TRBPR and TRBSC are reloaded to the counter alternately and counted.

When the TSTOP bit in the TRBCR register is set to 1, the TRBPR register is set to FFh.

### 18.2.8 Timer RB/RC Pin Select Register (TRBRCSR)

Address 0181h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	TRCCLKSEL1	TRCCLKSEL0	—	—	TRBOSEL1	TRBOSEL0
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	TRBOSEL0	TRBO pin select bit	b1 b0 0 0: P1_3 assigned 0 1: P3_1 assigned 1 0: Do not set. 1 1: P3_3 assigned	R/W
b1	TRBOSEL1			R/W
b2	—	Reserved bit	Set to 0.	R/W
b3	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b4	TRCCLKSEL0	TRCCLK pin select bit	b5 b4 0 0: TRCCLK pin not used 0 1: P1_4 assigned 1 0: P3_3 assigned 1 1: P3_7 assigned	R/W
b5	TRCCLKSEL1			R/W
b6	—	Reserved bit	Set to 0.	R/W
b7	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—

The TRBRCSR register selects which pin is assigned to the timer RB and timer RC I/O. To use the I/O pin for timer RB and timer RC, set this register.

Set bits TRBOSEL0 and TRBOSEL1 before setting the timer RB associated registers. Set bits TRCCLKSEL0 and TRCCLKSEL1 before setting the timer RC associated registers. Also, do not change the setting values of bits TRBOSEL0 and TRBOSEL1 during timer RB operation. Do not change the setting values of bits TRCCLKSEL0 and TRCCLKSEL1 during timer RC operation.

### 18.3 Timer Mode

In timer mode, a count source which is internally generated or timer RA underflows are counted (refer to **Table 18.2 Timer Mode Specifications**). Registers TRBOCR and TRBSC are not used in timer mode.

**Table 18.2 Timer Mode Specifications**

Item	Specification
Count sources	f1, f2, f8, timer RA underflow
Count operations	<ul style="list-style-type: none"> <li>Decrement</li> <li>When the timer underflows, it reloads the reload register contents before the count continues (when timer RB underflows, the contents of timer RB primary reload register is reloaded).</li> </ul>
Divide ratio	$1/(n+1)(m+1)$ n: setting value in TRBPRES register, m: setting value in TRBPR register
Count start condition	1 (count starts) is written to the TSTART bit in the TRBCR register.
Count stop conditions	<ul style="list-style-type: none"> <li>0 (count stops) is written to the TSTART bit in the TRBCR register.</li> <li>1 (count forcibly stop) is written to the TSTOP bit in the TRBCR register.</li> </ul>
Interrupt request generation timing	When timer RB underflows [timer RB interrupt].
TRBO pin function	Programmable I/O port
INT0 pin function	Programmable I/O port or $\overline{\text{INT0}}$ interrupt input
Read from timer	The count value can be read out by reading registers TRBPR and TRBPRES.
Write to timer	<ul style="list-style-type: none"> <li>When registers TRBPRES and TRBPR are written while the count is stopped, values are written to both the reload register and counter.</li> <li>When registers TRBPRES and TRBPR are written to while count operation is in progress:                If the TWRC bit in the TRBMR register is set to 0, the value is written to both the reload register and the counter.                If the TWRC bit is set to 1, the value is written to the reload register only.                (Refer to <b>18.3.2 Timer Write Control during Count Operation.</b>)</li> </ul>

### 18.3.2 Timer Write Control during Count Operation

Timer RB has a prescaler and a timer (which counts the prescaler underflows). The prescaler and timer each consist of a reload register and a counter. In timer mode, the TWRC bit in the TRBMR register can be used to select whether writing to the prescaler or timer during count operation is performed to both the reload register and counter or only to the reload register.

However, values are transferred from the reload register to the counter of the prescaler in synchronization with the count source. In addition, values are transferred from the reload register to the counter of the timer in synchronization with prescaler underflows. Therefore, even if the TWRC bit is set for writing to both the reload register and counter, the counter value is not updated immediately after the WRITE instruction is executed. In addition, if the TWRC bit is set for writing to the reload register only, the synchronization of the writing will be shifted if the prescaler value changes. Figure 18.2 shows an Operating Example of Timer RB when Counter Value is Rewritten during Count Operation.

**Figure 18.2 Operating Example of Timer RB when Counter Value is Rewritten during Count Operation**

## 18.4 Programmable Waveform Generation Mode

In programmable waveform generation mode, the signal output from the TRBO pin is inverted each time the counter underflows, while the values in registers TRBPR and TRBSC are counted alternately (refer to **Table 18.3 Programmable Waveform Generation Mode Specifications**). Counting starts by counting the setting value in the TRBPR register. The TRBOCR register is unused in this mode.

Figure 18.3 shows an Operating Example of Timer RB in Programmable Waveform Generation Mode.

**Table 18.3 Programmable Waveform Generation Mode Specifications**

Item	Specification
Count sources	f1, f2, f8, timer RA underflow
Count operations	<ul style="list-style-type: none"> <li>Decrement</li> <li>When the timer underflows, it reloads the contents of the primary reload and secondary reload registers alternately before the count continues.</li> </ul>
Width and period of output waveform	Primary period: $(n+1)(m+1)/f_i$ Secondary period: $(n+1)(p+1)/f_i$ Period: $(n+1)\{(m+1)+(p+1)\}/f_i$ $f_i$ : Count source frequency $n$ : Value set in TRBPRES register, $m$ : Value set in TRBPR register $p$ : Value set in TRBSC register
Count start condition	1 (count start) is written to the TSTART bit in the TRBCR register.
Count stop conditions	<ul style="list-style-type: none"> <li>0 (count stop) is written to the TSTART bit in the TRBCR register.</li> <li>1 (count forcibly stop) is written to the TSTOP bit in the TRBCR register.</li> </ul>
Interrupt request generation timing	In half a cycle of the count source, after timer RB underflows during the secondary period (at the same time as the TRBO output change) [timer RB interrupt]
TRBO pin function	Programmable output port or pulse output
INT0 pin function	Programmable I/O port or $\overline{\text{INT0}}$ interrupt input
Read from timer	The count value can be read out by reading registers TRBPR and TRBPRES. <sup>(1)</sup>
Write to timer	<ul style="list-style-type: none"> <li>When registers TRBPRES, TRBSC, and TRBPR are written while the count is stopped, values are written to both the reload register and counter.</li> <li>When registers TRBPRES, TRBSC, and TRBPR are written to during count operation, values are written to the reload registers only. <sup>(2)</sup></li> </ul>
Selectable functions	<ul style="list-style-type: none"> <li>Output level select function The output level during primary and secondary periods is selected by the TOPL bit in the TRBIOC register.</li> <li>TRBO pin output switch function Timer RB pulse output or P3_1 (P1_3) latch output is selected by the TOCNT bit in the TRBIOC register. <sup>(3)</sup></li> </ul>

Notes:

- Even when counting the secondary period, the TRBPR register may be read.
- The set values are reflected in the waveform output beginning with the following primary period after writing to the TRBPR register.
- The value written to the TOCNT bit is enabled by the following.
  - When counting starts.
  - When a timer RB interrupt request is generated.
 The contents after the TOCNT bit is changed are reflected from the output of the following primary period.

### 18.4.2 Operating Example

**Figure 18.3 Operating Example of Timer RB in Programmable Waveform Generation Mode**

## 18.5 Programmable One-shot Generation Mode

In programmable one-shot generation mode, a one-shot pulse is output from the TRBO pin by a program or an external trigger input (input to the  $\overline{\text{INT0}}$  pin) (refer to **Table 18.4 Programmable One-Shot Generation Mode Specifications**). When a trigger is generated, the timer starts operating from the point only once for a given period equal to the set value in the TRBPR register. The TRBSC register is not used in this mode.

Figure 18.4 shows an Operating Example of Programmable One-Shot Generation Mode.

**Table 18.4 Programmable One-Shot Generation Mode Specifications**

Item	Specification
Count sources	f1, f2, f8, timer RA underflow
Count operations	<ul style="list-style-type: none"> <li>Decrement the setting value in the TRBPR register</li> <li>When the timer underflows, it reloads the contents of the reload register before the count completes and the TOSSTF bit is set to 0 (one-shot stops).</li> <li>When the count stops, the timer reloads the contents of the reload register before it stops.</li> </ul>

Note:

1. Refer to **18.5.3 One-Shot Trigger Selection**.

### 18.5.2 Operating Example

**Figure 18.4 Operating Example of Programmable One-Shot Generation Mode**

### 18.5.3 One-Shot Trigger Selection

In programmable one-shot generation mode and programmable wait one-shot generation mode, operation starts when a one-shot trigger is generated while the TCSTF bit in the TRBCR register is set to 1 (count starts).

A one-shot trigger can be generated by either of the following causes:

- 1 is written to the TOSST bit in the TRBOCR register by a program.
- Trigger input from the  $\overline{\text{INT0}}$  pin.

When a one-shot trigger occurs, the TOSSTF bit in the TRBOCR register is set to 1 (one-shot operation in progress) after one or two cycles of the count source have elapsed. Then, in programmable one-shot generation mode, count operation begins and one-shot waveform output starts. (In programmable wait one-shot generation mode, count operation starts for the wait period.) If a one-shot trigger occurs while the TOSSTF bit is set to 1, no retriggering occurs.

To use trigger input from the  $\overline{\text{INT0}}$  pin, input the trigger after making the following settings:

- Set the PD4\_5 bit in the PD4 register to 0 (input port).
- Select the  $\overline{\text{INT0}}$  digital filter with bits INT0F1 and INT0F0 in the INTF register.
- Select both edges or one edge with the INT0PL bit in INTEN register. If one edge is selected, further select falling or rising edge with the INOSEG bit in TRBIOC register.
- Set the INT0EN bit in the INTEN register to 1 (enabled).
- After completing the above, set the INOSTG bit in the TRBIOC register to 1 ( $\overline{\text{INT0}}$  pin one-shot trigger enabled).

Note the following points with regard to generating interrupt requests by trigger input from the  $\overline{\text{INT0}}$  pin.

- Processing to handle the interrupts is required. Refer to **11. Interrupts**, for details.
- If one edge is selected, use the POL bit in the INT0IC register to select falling or rising edge. (The INOSEG bit in the TRBIOC register does not affect  $\overline{\text{INT0}}$  interrupts).
- If a one-shot trigger occurs while the TOSSTF bit is set to 1, timer RB operation is not affected, but the value of the IR bit in the INT0IC register changes.

## 18.6 Programmable Wait One-Shot Generation Mode

In programmable wait one-shot generation mode, a one-shot pulse is output from the TRBO pin by a program or an external trigger input (input to the  $\overline{\text{INT0}}$  pin) (refer to **Table 18.5 Programmable Wait One-Shot Generation Mode Specifications**). When a trigger is generated from that point, the timer outputs a pulse only once for a given length of time equal to the setting value in the TRBSC register after waiting for a given length of time equal to the setting value in the TRBPR register.

Figure 18.5 shows an Operating Example of Programmable Wait One-Shot Generation Mode.

**Table 18.5 Programmable Wait One-Shot Generation Mode Specifications**

Item	Specification
Count sources	f1, f2, f8, timer RA underflow

### 18.6.2 Operating Example

**Figure 18.5 Operating Example of Programmable Wait One-Shot Generation Mode**

## 18.7 Notes on Timer RB

- Timer RB stops counting after a reset. Set the values in the timer RB and timer RB prescalers before the count starts.
- Even if the prescaler and timer RB is read out in 16-bit units, these registers are read 1 byte at a time by the MCU. Consequently, the timer value may be updated during the period when these two registers are being read.
- In programmable one-shot generation mode and programmable wait one-shot generation mode, when setting the TSTART bit in the TRBCR register to 0 (stops counting) or setting the TOSSP bit in the TRBOCR register to 1 (stops one-shot), the timer reloads the value of reload register and stops. Therefore, in programmable one-shot generation mode and programmable wait one-shot generation mode, read the timer count value before the timer stops.
- The TCSTF bit remains 0 (count stops) for 1 to 2 cycles of the count source after setting the TSTART bit to 1 (count starts) while the count is stopped.

During this time, do not access registers associated with timer RB <sup>(1)</sup> other than the TCSTF bit. Timer RB starts counting at the first valid edge of the count source after the TCSTF bit is set to 1 (during count).

The TCSTF bit remains 1 for 1 to 2 cycles of the count source after setting the TSTART bit to 0 (count stops) while the count is in progress. Timer RB counting is stopped when the TCSTF bit is set to 0.

During this time, do not access registers associated with timer RB <sup>(1)</sup> other than the TCSTF bit.

Note:

1. Registers associated with timer RB: TRBCR, TRBOCR, TRBIOC, TRBMR, TRBPRES, TRBSC, and TRBPR.

- If the TSTOP bit in the TRBCR register is set to 1 during timer operation, timer RB stops immediately.
- If 1 is written to the TOSST or TOSSP bit in the TRBOCR register, the value of the TOSSTF bit changes after one or two cycles of the count source have elapsed. If the TOSSP bit is written to 1 during the period between when the TOSST bit is written to 1 and when the TOSSTF bit is set to 1, the TOSSTF bit may be set to either 0 or 1 depending on the content state. Likewise, if the TOSST bit is written to 1 during the period between when the TOSSP bit is written to 1 and when the TOSSTF bit is set to 0, the TOSSTF bit may be set to either 0 or 1.
- To use the underflow signal of timer RA as the count source for timer RB, set timer RA in timer mode, pulse output mode, or event count mode.

### 18.7.1 Timer Mode

To write to registers TRBPRES and TRBPR during count operation (TCSTF bit in the TRBCR register is set to 1), note the following points:

- When the TRBPRES register is written continuously, allow three or more cycles of the count source for each write interval.
- When the TRBPR register is written continuously, allow three or more cycles of the prescaler underflow for each write interval.

### 18.7.2 Programmable Waveform Generation Mode

To write to registers TRBPRES and TRBPR during count operation (TCSTF bit in the TRBCR register is set to 1), note the following points:

- When the TRBPRES register is written continuously, allow three or more cycles of the count source for each write interval.
- When the TRBPR register is written continuously, allow three or more cycles of the prescaler underflow for each write interval.

### 18.7.3 Programmable One-shot Generation Mode

To write to registers TRBPRES and TRBPR during count operation (TCSTF bit in the TRBCR register is set to 1), note the following points:

- When the TRBPRES register is written continuously during count operation (TCSTF bit is set to 1), allow three or more cycles of the count source for each write interval.
- When the TRBPR register is written continuously during count operation (TCSTF bit is set to 1), allow three or more cycles of the prescaler underflow for each write interval.

### 18.7.4 Programmable Wait One-shot Generation Mode

To write to registers TRBPRES and TRBPR during count operation (TCSTF bit in the TRBCR register is set to 1), note the following points:

- When the TRBPRES register is written continuously, allow three or more cycles of the count source for each write interval.
- When the TRBPR register is written continuously, allow three or more cycles of the prescaler underflow for each write interval.

## 19. Timer RC

Timer RC is a 16-bit timer with four I/O pins.

### 19.1 Overview

Timer RC uses either f1, fOCO40M or fOCO-F as its operation clock. Table 19.1 lists the Timer RC Operation Clock.

**Table 19.1 Timer RC Operation Clock**

Condition	Timer RC Operation Clock
Count source is f1, f2, f4, f8, f32, or TRCCLK input (bits TCK2 to TCK0 in TRCCR1 register are set to a value from 000b to 101b)	f1
Count source is fOCO40M (bits TCK2 to TCK0 in TRCCR1 register are set to 110b)	fOCO40M
Count source is fOCO-F (bits TCK2 to TCK0 in TRCCR1 register are set to 111b)	fOCO-F

Table 19.2 lists the Pin Configuration of Timer RC, and Figure 19.1 shows a Timer RC Block Diagram.

Timer RC has three modes.

- Timer mode
  - Input capture function      The counter value is captured to a register, using an external signal as the trigger.
  - Output compare function      Matches between the counter and register values are detected. (Pin output state changes when a match is detected.)

The following two modes use the output compare function.

- PWM mode      Pulses of a given width are output continuously.
- PWM2 mode      A one-shot waveform or PWM waveform is output following the trigger after the wait time has elapsed.

Input capture function, output compare function, and PWM mode settings may be specified independently for each pin.

In PWM2 mode waveforms are output based on a combination of the counter or the register.

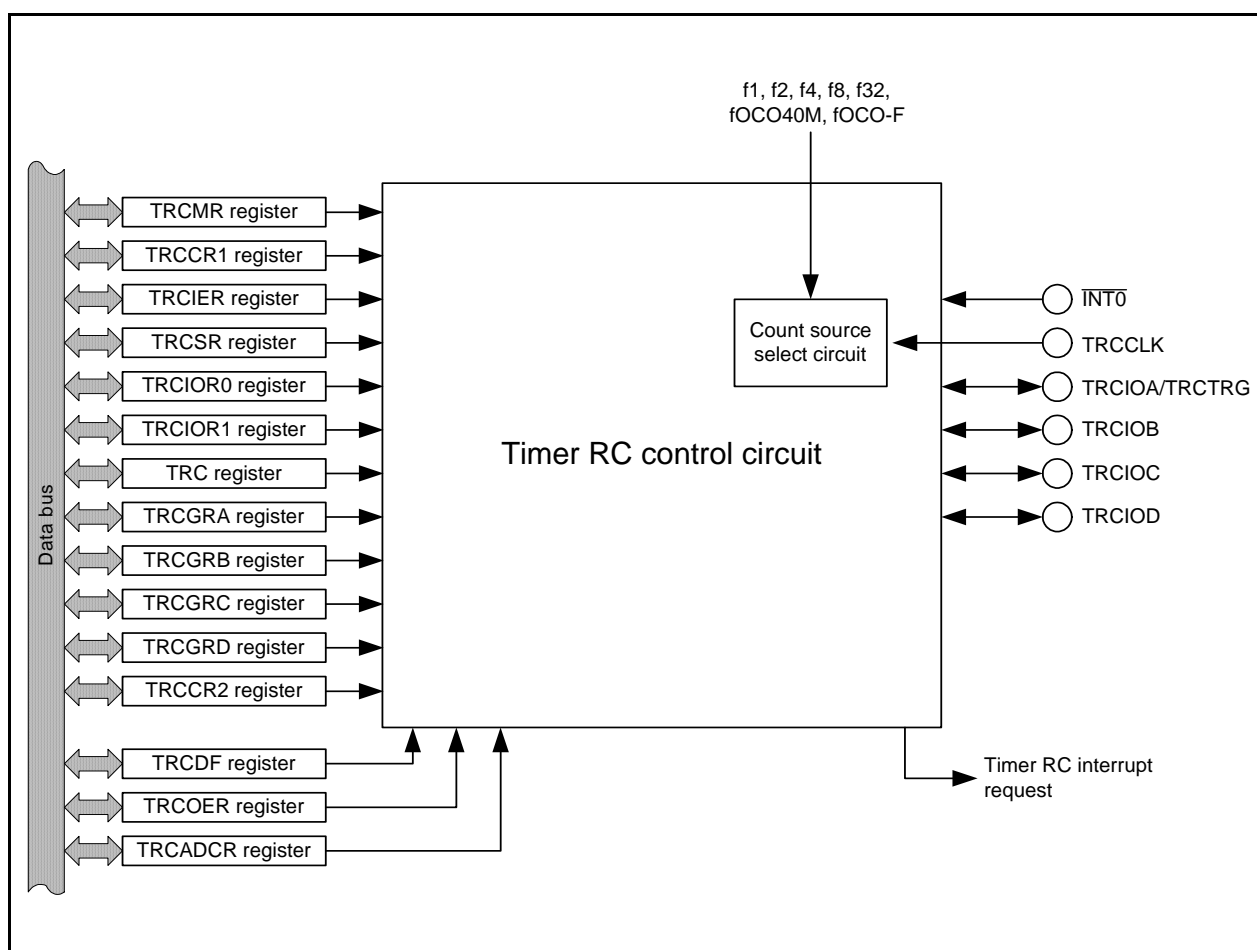

Figure 19.1 Timer RC Block Diagram

Table 19.2 Pin Configuration of Timer RC

Pin Name	Assigned Pin	I/O	Function
TRCIOA	P0_0, P0_1, P0_2, P1_1, or P3_1	I/O	Function differs according to the mode. Refer to descriptions of individual modes for details.
TRCIOB	P0_3, P0_4, P0_5, P1_2, or P2_0		
TRCIOC	P0_7, P1_3, P2_1, or P3_4		
TRCIOD	P0_6, P1_0, P2_2, or P3_5		
TRCCLK	P1_4, P3_3, or P3_7	Input	External clock input
TRCTR	P0_0, P0_1, P0_2, P1_1, or P3_1	Input	PWM2 mode external trigger input

## 19.2 Registers

Table 19.3 lists the Registers Associated with Timer RC.

**Table 19.3 Registers Associated with Timer RC**

Address	Symbol	Mode				Related Information
		Timer		PWM	PWM2	
		Input Capture Function	Output Compare Function

### 19.2.1 Module Standby Control Register (MSTCR)

Address 0008h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	MSTTRC	MSTTRD	—	—	—	—
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b1	—			
b2	—			
b3	—	Reserved bit	Set to 0.	R/W
b4	MSTTRD	Power consumption reduce bit	Set to 1. The power consumption can be reduced.	R/W
b5	MSTTRC	Timer RC standby bit	0: Active 1: Standby <sup>(1)</sup>	R/W
b6	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b7	—			

Note:

- When the MSTTRC bit is set to 1 (standby), any access to the timer RC associated registers (addresses 0120h to 0133h) is disabled.

### 19.2.2 Timer RC Mode Register (TRCMR)

Address 0120h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	TSTART	—	BFD	BFC	PWM2	PWMD	PWMC	PWMB
After Reset	0	1	0	0	1	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	PWMB	PWM mode of TRCIOB select bit <sup>(1)</sup>	0: Timer mode 1: PWM mode	R/W
b1	PWMC	PWM mode of TRCIOC select bit <sup>(1)</sup>	0: Timer mode 1: PWM mode	R/W
b2	PWMD	PWM mode of TRCIOD select bit <sup>(1)</sup>	0: Timer mode 1: PWM mode	R/W
b3	PWM2	PWM2 mode select bit	0: PWM 2 mode 1: Timer mode or PWM mode	R/W
b4	BFC	TRCGRC register function select bit <sup>(2)</sup>	0: General register 1: Buffer register of TRCGRA register	R/W
b5	BFD	TRCGRD register function select bit	0: General register 1: Buffer register of TRCGRB register	R/W
b6	—	Nothing is assigned. If necessary, set to 0. When read, the content is 1.		—
b7	TSTART	TRC count start bit	0: Count stops 1: Count starts	R/W

Notes:

- These bits are enabled when the PWM2 bit is set to 1 (timer mode or PWM mode).
- Set the BFC bit to 0 (general register) in PWM2 mode.

For notes on PWM2 mode, refer to **19.9.6 TRCMR Register in PWM2 Mode**.

### 19.2.3 Timer RC Control Register 1 (TRCCR1)

Address 0121h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	CCLR	TCK2	TCK1	TCK0	TOD	TOC	TOB	TOA
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	TOA	TRCIOA output level select bit <sup>(1)</sup>	Function varies according to the operating mode (function).	R/W
b1	TOB	TRCIOB output level select bit <sup>(1)</sup>		R/W
b2	TOC	TRCIOC output level select bit <sup>(1)</sup>		R/W
b3	TOD	TRCIOD output level select bit <sup>(1)</sup>		R/W
b4	TCK0	Count source select bit <sup>(1)</sup>	b6 b5 b4 0 0 0: f1 0 0 1: f2 0 1 0: f4 0 1 1: f8 1 0 0: f32 1 0 1: TRCLK input rising edge 1 1 0: fOCO40M 1 1 1: fOCO-F <sup>(2)</sup>	R/W
b5	TCK1			R/W
b6	TCK2			R/W
b7	CCLR	TRC counter clear select bit	0: Disable clear (free-running operation) 1: Clear TRC counter by input capture or by compare match in TRCGRA	R/W

Notes:

1. Set to these bits when the TSTART bit in the TRCMR register is set to 0 (count stops).
2. To select fOCO-F, set it to the clock frequency higher than the CPU clock frequency.

### 19.2.4 Timer RC Interrupt Enable Register (TRCIER)

Address 0122h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	OVIE	—	—	—	IMIED	IMIEC	IMIEB	IMIEA
After Reset	0	1	1	1	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	IMIEA	Input capture / compare match interrupt enable bit A	0: Disable interrupt (IMIA) by the IMFA bit 1: Enable interrupt (IMIA) by the IMFA bit	R/W
b1	IMIEB	Input capture / compare match interrupt enable bit B	0: Disable interrupt (IMIB) by the IMFB bit 1: Enable interrupt (IMIB) by the IMFB bit	R/W
b2	IMIEC	Input capture / compare match interrupt enable bit C	0: Disable interrupt (IMIC) by the IMFC bit 1: Enable interrupt (IMIC) by the IMFC bit	R/W
b3	IMIED	Input capture / compare match interrupt enable bit D	0: Disable interrupt (IMID) by the IMFD bit 1: Enable interrupt (IMID) by the IMFD bit	R/W
b4	—	Nothing is assigned. If necessary, set to 0. When read, the content is 1.		—
b5	—			
b6	—			
b7	OVIE	Overflow interrupt enable bit	0: Disable interrupt (OVI) by the OVF bit 1: Enable interrupt (OVI) by the OVF bit	R/W

### 19.2.5 Timer RC Status Register (TRCSR)

Address 0123h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	OVF	—	—	—	IMFD	IMFC	IMFB	IMFA
After Reset	0	1	1	1	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	IMFA	Input capture / compare match flag A	[Source for setting this bit to 0] Write 0 after read. <sup>(1)</sup>	R/W
b1	IMFB	Input capture / compare match flag B	[Source for setting this bit to 1] Refer to <b>Table 19.4 Source for Setting Bit of Each Flag to 1.</b>	R/W
b2	IMFC	Input capture / compare match flag C		R/W
b3	IMFD	Input capture / compare match flag D		R/W
b4	—	Nothing is assigned. If necessary, set to 0. When read, the content is 1.		—
b5	—			
b6	—			
b7	OVF	Overflow flag	[Source for setting this bit to 0] Write 0 after read. <sup>(1)</sup> [Source for setting this bit to 1] Refer to <b>Table 19.4 Source for Setting Bit of Each Flag to 1.</b>	R/W

Note:

1. The writing results are as follows:

- This bit is set to 0 when the read result is 1 and 0 is written to the same bit.
- This bit remains unchanged even if the read result is 0 and 0 is written to the same bit. (This bit remains 1 even if it is set to 1 from 0 after reading, and writing 0.)
- This bit remains unchanged if 1 is written to it.

**Table 19.4 Source for Setting Bit of Each Flag to 1**

Bit Symbol	Timer Mode		PWM Mode	PWM2 Mode
	Input capture Function	Output Compare Function		
IMFA	TRCIOA pin input edge <sup>(1)</sup>	When the values of the registers TRC and TRCGRA match.		
IMFB	TRCIOB pin input edge <sup>(1)</sup>	When the values of the registers TRC and TRCGRB match.		
IMFC	TRCIOC pin input edge <sup>(1)</sup>	When the values of the registers TRC and TRCGRC match. <sup>(2)</sup>		
IMFD	TRCIOD pin input edge <sup>(1)</sup>	When the values of the registers TRC and TRCGRD match. <sup>(2)</sup>		
OVF	When the TRC register overflows.			

Notes:

1. Edge selected by bits IOj1 to IOj0 (j = A, B, C, or D).
2. Includes the condition that bits BFC and BFD are set to 1 (buffer registers of registers TRCGRA and TRCGRB).

### 19.2.6 Timer RC I/O Control Register 0 (TRCIOR0)

Address 0124h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	IOB2	IOB1	IOB0	IOA3	IOA2	IOA1	IOA0
After Reset	1	0	0	0	1	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	IOA0	TRCGRA control bit	Function varies according to the operating mode (function).	R/W
b1	IOA1			R/W
b2	IOA2	TRCGRA mode select bit <sup>(1)</sup>	0: Output compare function 1: Input capture function	R/W
b3	IOA3	TRCGRA input capture input switch bit <sup>(3)</sup>	0: fOCO128 signal 1: TRCIOA pin input	R/W
b4	IOB0	TRCGRB control bit	Function varies according to the operating mode (function).	R/W
b5	IOB1			R/W
b6	IOB2	TRCGRB mode select bit <sup>(2)</sup>	0: Output compare function 1: Input capture function	R/W
b7	—	Nothing is assigned. If necessary, set to 0. When read, the content is 1.		—

Notes:

1. When the BFC bit in the TRCMR register is set to 1 (buffer register of TRCGRA register), set the IOC2 bit in the TRCIOR1 register to the same value as the IOA2 bit in the TRCIOR0 register.
2. When the BFD bit in the TRCMR register is set to 1 (buffer register of TRCGRB register), set the IOD2 bit in the TRCIOR1 register to the same value as the IOB2 bit in the TRCIOR0 register.
3. The IOA3 bit is enabled when the IOA2 bit is set to 1 (input capture function).

The TRCIOR0 register is enabled in timer mode. It is disabled in modes PWM and PWM2.

### 19.2.7 Timer RC I/O Control Register 1 (TRCIOR1)

Address 0125h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	IOD3	IOD2	IOD1	IOD0	IOC3	IOC2	IOC1	IOC0
After Reset	1	0	0	0	1	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	IOC0	TRCGRC control bit	Function varies according to the operating mode (function).	R/W
b1	IOC1			R/W
b2	IOC2	TRCGRC mode select bit <sup>(1)</sup>	0: Output compare function 1: Input capture function	R/W
b3	IOC3	TRCGRC register function select bit	0: TRCIOA output register 1: General register or buffer register	R/W
b4	IOD0	TRCGRD control bit	Function varies according to the operating mode (function).	R/W
b5	IOD1			R/W
b6	IOD2	TRCGRD mode select bit <sup>(2)</sup>	0: Output compare function 1: Input capture function	R/W
b7	IOD3	TRCGRD register function select bit	0: TRCIOB output register 1: General register or buffer register	R/W

Notes:

1. When the BFC bit in the TRCMR register is set to 1 (buffer register of TRCGRA register), set the IOC2 bit in the TRCIOR1 register to the same value as the IOA2 bit in the TRCIOR0 register.
2. When the BFD bit in the TRCMR register is set to 1 (buffer register of TRCGRB register), set the IOD2 bit in the TRCIOR1 register to the same value as the IOB2 bit in the TRCIOR0 register.

The TRCIOR1 register is enabled in timer mode. It is disabled in modes PWM and PWM2.

### 19.2.8 Timer RC Counter (TRC)

Address 0127h to 0126h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	—	—	—	—
After Reset	0	0	0	0	0	0	0	0

Bit	b15	b14	b13	b12	b11	b10	b9	b8
Symbol	—	—	—	—	—	—	—	—
After Reset	0	0	0	0	0	0	0	0

Bit	Function	Setting Range	R/W
b15 to b0	Count a count source. Count operation is incremented. When an overflow occurs, the OVF bit in the TRCSR register is set to 1.	0000h to FFFFh	R/W

Access the TRC register in 16-bit units. Do not access it in 8-bit units.

### 19.2.9 Timer RC General Registers A, B, C, and D (TRCGRA, TRCGRB, TRCGRC, TRCGRD)

Address 0129h to 0128h (TRCGRA), 012Bh to 012Ah (TRCGRB), 012Dh to 012Ch (TRCGRC), 012Fh to 012Eh (TRCGRD)

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	—	—	—	—
After Reset	1	1	1	1	1	1	1	1

Bit	b15	b14	b13	b12	b11	b10	b9	b8
Symbol	—	—	—	—	—	—	—	—
After Reset	1	1	1	1	1	1	1	1

Bit	Function	R/W
b15 to b0	Function varies according to the operating mode.	R/W

Access registers TRCGRA to TRCGRD in 16-bit units. Do not access them in 8-bit units.

### 19.2.10 Timer RC Control Register 2 (TRCCR2)

Address 0130h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	TCEG1	TCEG0	CSEL	—	—	POLD	POLC	POLB
After Reset	0	0	0	1	1	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	POLB	PWM mode output level control bit B <sup>(1)</sup>	0: TRCIOB output level selected as “L” active 1: TRCIOB output level selected as “H” active	R/W
b1	POLC	PWM mode output level control bit C <sup>(1)</sup>	0: TRCIOC output level selected as “L” active 1: TRCIOC output level selected as “H” active	R/W
b2	POLD	PWM mode output level control bit D <sup>(1)</sup>	0: TRCIOD output level selected as “L” active 1: TRCIOD output level selected as “H” active	R/W
b3	—	Nothing is assigned. If necessary, set to 0. When read, the content is 1.		—
b4	—			
b5	CSEL	TRC count operation select bit <sup>(2)</sup>	0: Count continues at compare match with the TRCGRA register 1: Count stops at compare match with the TRCGRA register	R/W
b6	TCEG0	TRCTRG input edge select bit <sup>(3)</sup>	b7 b6 0 0: Disable the trigger input from the TRCTRG pin 0 1: Rising edge selected 1 0: Falling edge selected 1 1: Both edges selected	R/W
b7	TCEG1			R/W

Notes:

1. Enabled when in PWM mode.
2. Enabled when in output compare function, PWM mode, or PWM2 mode. For notes on PWM2 mode, refer to **19.9.6 TRCMR Register in PWM2 Mode**.
3. Enabled when in PWM2 mode.

### 19.2.11 Timer RC Digital Filter Function Select Register (TRCDF)

Address 0131h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	DFCK1	DFCK0	—	DFTRG	DFD	DFC	DFB	DFA
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	DFA	TRCIOA pin digital filter function select bit <sup>(1)</sup>	0: Function is not used 1: Function is used	R/W
b1	DFB	TRCIOB pin digital filter function select bit <sup>(1)</sup>		R/W
b2	DFC	TRCIOC pin digital filter function select bit <sup>(1)</sup>		R/W
b3	DFD	TRCIOD pin digital filter function select bit <sup>(1)</sup>		R/W
b4	DFTRG	TRCTRG pin digital filter function select bit <sup>(2)</sup>		R/W
b5	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b6	DFCK0	Clock select bits for digital filter function <sup>(1, 2)</sup>	b7 b6 0 0: f32 0 1: f8 1 0: f1 1 1: Count source (clock selected by bits TCK2 to TCK0 in the TRCCR1 register)	R/W
b7	DFCK1			R/W

Notes:

1. These bits are enabled for the input capture function.
2. These bits are enabled when in PWM2 mode and bits TCEG1 to TCEG0 in the TRCCR2 register are set to 01b, 10b, or 11b (TRCTRG trigger input enabled).

### 19.2.12 Timer RC Output Master Enable Register (TRCOER)

Address 0132h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	PTO	—	—	—	ED	EC	EB	EA
After Reset	0	1	1	1	1	1	1	1

Bit	Symbol	Bit Name	Function	R/W
b0	EA	TRCIOA output disable bit <sup>(1)</sup>	0: Enable output 1: Disable output (The TRCIOA pin is used as a programmable I/O port.)	R/W
b1	EB	TRCIOB output disable bit <sup>(1)</sup>	0: Enable output 1: Disable output (The TRCIOB pin is used as a programmable I/O port.)	R/W
b2	EC	TRCIOC output disable bit <sup>(1)</sup>	0: Enable output 1: Disable output (The TRCIOC pin is used as a programmable I/O port.)	R/W
b3	ED	TRCIOD output disable bit <sup>(1)</sup>	0: Enable output 1: Disable output (The TRCIOD pin is used as a programmable I/O port.)	R/W
b4	—	Nothing is assigned. If necessary, set to 0. When read, the content is 1.		—
b5	—			
b6	—			
b7	PTO	INT0 of pulse output forced cutoff signal input enabled bit	0: Pulse output forced cutoff input disabled 1: Pulse output forced cutoff input enabled (Bits EA, EB, EC, and ED are set to 1 (disable output) when "L" is applied to the INT0 pin)	R/W

Note:

- These bits are disabled for input pins set to the input capture function.

### 19.2.13 Timer RC Trigger Control Register (TRCADCR)

Address 0133h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	ADTRGDE	ADTRGCE	ADTRGBE	ADTRGAE
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	ADTRGAE	A/D trigger A enable bit	0: A/D trigger disabled 1: A/D trigger generated at compare match with registers TRC and TRCGRA	R/W
b1	ADTRGBE	A/D trigger B enable bit	0: A/D trigger disabled 1: A/D trigger generated at compare match with registers TRC and TRCGRB	R/W
b2	ADTRGCE	A/D trigger C enable bit	0: A/D trigger disabled 1: A/D trigger generated at compare match with registers TRC and TRCGRC	R/W
b3	ADTRGDE	A/D trigger D enable bit	0: A/D trigger disabled 1: A/D trigger generated at compare match with registers TRC and TRCGRD	R/W
b4	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b5	—			
b6	—			
b7	—			

### 19.2.14 Timer RB/RC Pin Select Register (TRBRCSR)

Address 0181h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	TRCCLKSEL1	TRCCLKSEL0	—	—	TRBOSEL1	TRBOSEL0
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	TRBOSEL0	TRBO pin select bit	b1 b0 0 0: P1_3 assigned 0 1: P3_1 assigned 1 0: Do not set. 1 1: P3_3 assigned	R/W
b1	TRBOSEL1			R/W
b2	—	Reserved bit	Set to 0.	R/W
b3	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b4	TRCCLKSEL0	TRCCLK pin select bit	b5 b4 0 0: TRCCLK pin not used 0 1: P1_4 assigned 1 0: P3_3 assigned 1 1: P3_7 assigned	R/W
b5	TRCCLKSEL1			R/W
b6	—	Reserved bit	Set to 0.	R/W
b7	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—

The TRBRCSR register selects which pin is assigned to the timer RB and timer RC I/O. To use the I/O pin for timer RB and timer RC, set this register.

Set bits TRBOSEL0 and TRBOSEL1 before setting the timer RB associated registers. Set bits TRCCLKSEL0 and TRCCLKSEL1 before setting the timer RC associated registers. Also, do not change the setting values of bits TRBOSEL0 and TRBOSEL1 during timer RB operation. Do not change the setting values of bits TRCCLKSEL0 and TRCCLKSEL1 during timer RC operation.

### 19.2.15 Timer RC Pin Select Register 0 (TRCPSR0)

Address 0182h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	TRCIOBSEL2	TRCIOBSEL1	TRCIOBSEL0	—	TRCIOASEL2	TRCIOASEL1	TRCIOASEL0
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	TRCIOASEL0	TRCIOA/TRCTRG pin select bit	b2 b1 b0 0 0 0: TRCIOA/TRCTRG pin not used 0 0 1: P1_1 assigned 0 1 0: P0_0 assigned 0 1 1: P0_1 assigned 1 0 0: P0_2 assigned 1 0 1: Do not set. 1 1 0: P3_1 assigned 1 1 1: Do not set.	R/W
b1	TRCIOASEL1			R/W
b2	TRCIOASEL2			R/W
b3	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b4	TRCIOBSEL0	TRCIOB pin select bit	b6 b5 b4 0 0 0: TRCIOB pin not used 0 0 1: P1_2 assigned 0 1 0: P0_3 assigned 0 1 1: P0_4 assigned 1 0 0: P0_5 assigned 1 0 1: P2_0 assigned Other than above: Do not set.	R/W
b5	TRCIOBSEL1			R/W
b6	TRCIOBSEL2			R/W
b7	—	Reserved bit	Set to 0.	R/W

The TRCPSR0 register selects which pin is assigned to the timer RC I/O. To use the I/O pin for timer RC, set this register.

Set the TRCPSR0 register before setting the timer RC associated registers. Also, do not change the setting value in this register during timer RC operation.

### 19.2.16 Timer RC Pin Select Register 1 (TRCPSR1)

Address 0183h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	TRCIODSEL2	TRCIODSEL1	TRCIODSEL0	—	TRCIOCEL2	TRCIOCEL1	TRCIOCEL0
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	TRCIOCSEL0	TRCIO pin select bit	b2 b1 b0 0 0 0: TRCIO pin not used 0 0 1: P1_3 assigned 0 1 0: P3_4 assigned 0 1 1: P0_7 assigned 1 0 0: P2_1 assigned Other than above: Do not set.	R/W
b1	TRCIOCSEL1			R/W
b2	TRCIOCSEL2			R/W
b3	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b4	TRCIODSEL0	TRCIOD pin select bit	b6 b5 b4 0 0 0: TRCIOD pin not used 0 0 1: P1_0 assigned 0 1 0: P3_5 assigned 0 1 1: P0_6 assigned 1 0 0: P2_2 assigned Other than above: Do not set.	R/W
b5	TRCIODSEL1			R/W
b6	TRCIODSEL2			R/W
b7	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—

The TRCPSR1 register selects which pin is assigned to the timer RC I/O. To use the I/O pin for timer RC, set this register.

Set the TRCPSR1 register before setting the timer RC associated registers. Also, do not change the setting value in this register during timer RC operation.

## 19.3 Common Items for Multiple Modes

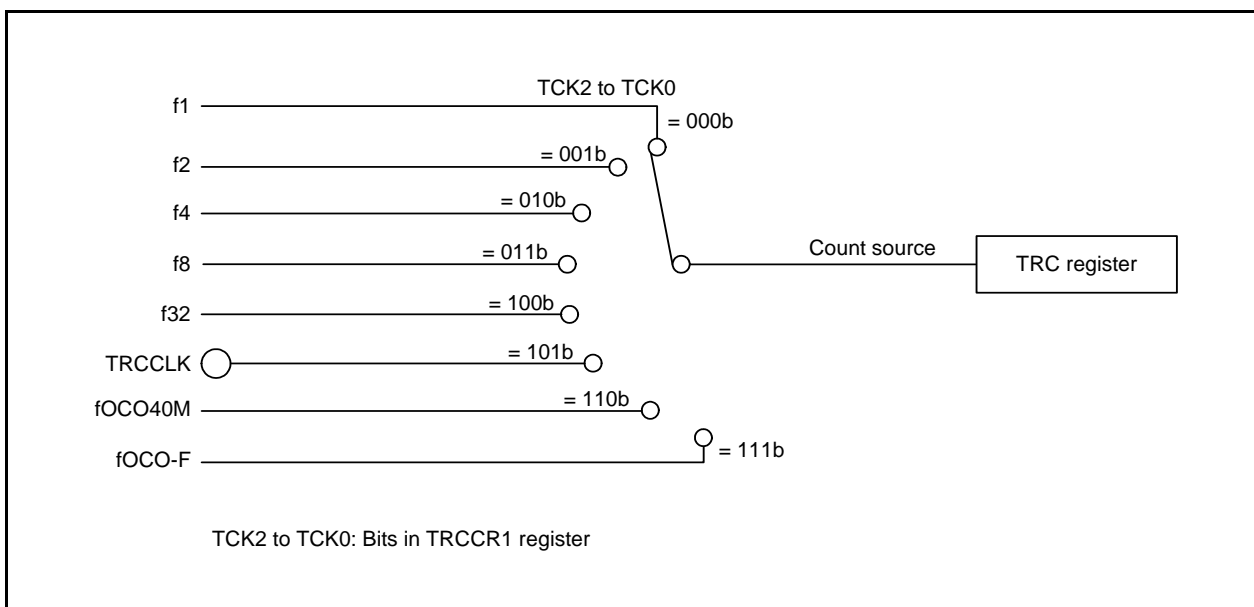

### 19.3.1 Count Source

The method of selecting the count source is common to all modes.

Table 19.5 lists the Count Source Selection, and Figure 19.2 shows a Count Source Block Diagram.

**Table 19.5 Count Source Selection**

Count Source	Selection Method
f1, f2, f4, f8, f32	Count source selected using bits TCK2 to TCK0 in TRCCR1 register
fOCO40M fOCO-F	FRA00 bit in FRA0 register set to 1 (high-speed on-chip oscillator on) Bits TCK2 to TCK0 in TRCCR1 register are set to 110b (fOCO40M) Bits TCK2 to TCK0 in TRCCR1 register are set to 111b (fOCO-F)
External signal input to TRCCLK pin	Bits TCK2 to TCK0 in TRCCR1 register are set to 101b (count source is rising edge of external clock) and the corresponding direction bit in the corresponding direction register is set is set to 0 (input mode)

**Figure 19.2 Count Source Block Diagram**

The pulse width of the external clock input to the TRCCLK pin should be three cycles or more of the timer RC operation clock (refer to **Table 19.1 Timer RC Operation Clock**).

To select fOCO40M or fOCO-F as the count source, set the FRA00 bit in the FRA0 register set to 1 (high-speed on-chip oscillator on), and then set bits TCK2 to TCK0 in the TRCCR1 register to 110b (fOCO40M) or 111b (fOCO-F).

### 19.3.2 Buffer Operation

Bits BFC and BFD in the TRCMR register are used to select the TRCGRC or TRCGRD register as the buffer register for the TRCGRA or TRCGRB register.

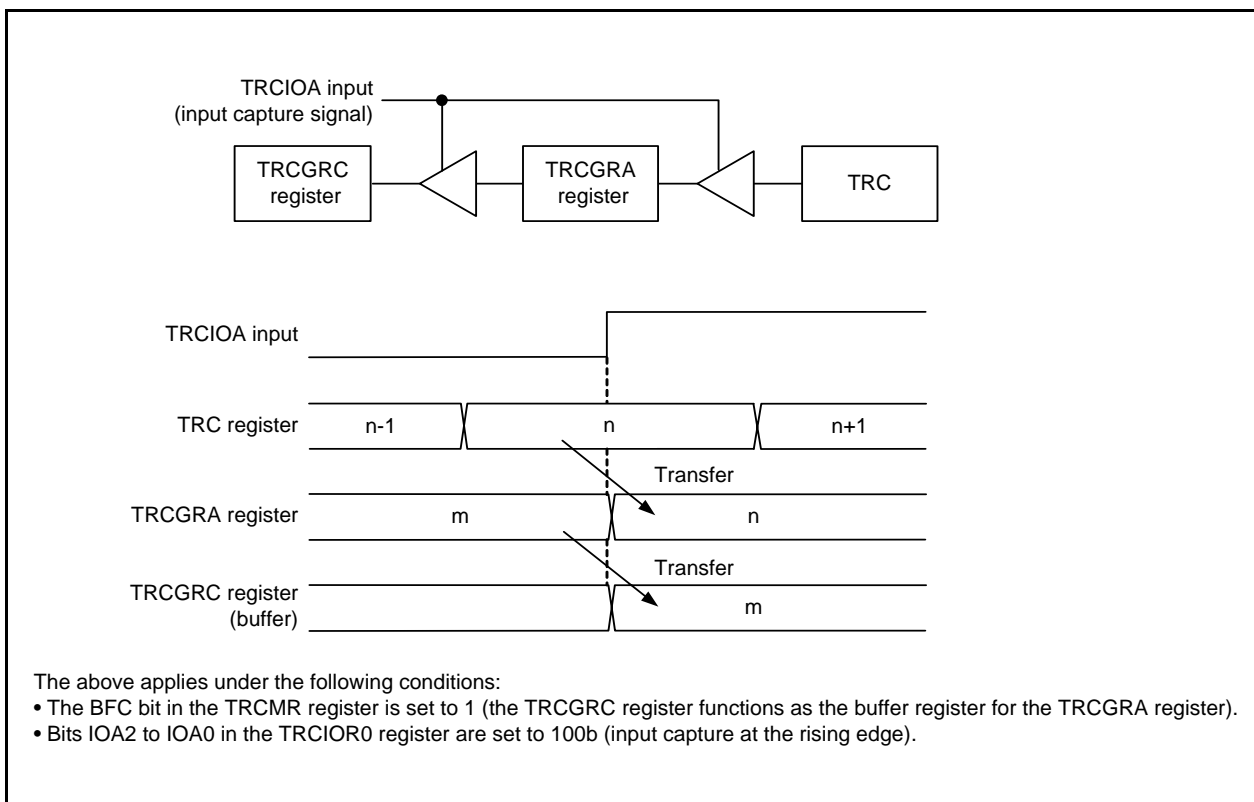

- Buffer register for TRCGRA register: TRCGRC register
- Buffer register for TRCGRB register: TRCGRD register

Buffer operation differs depending on the mode.

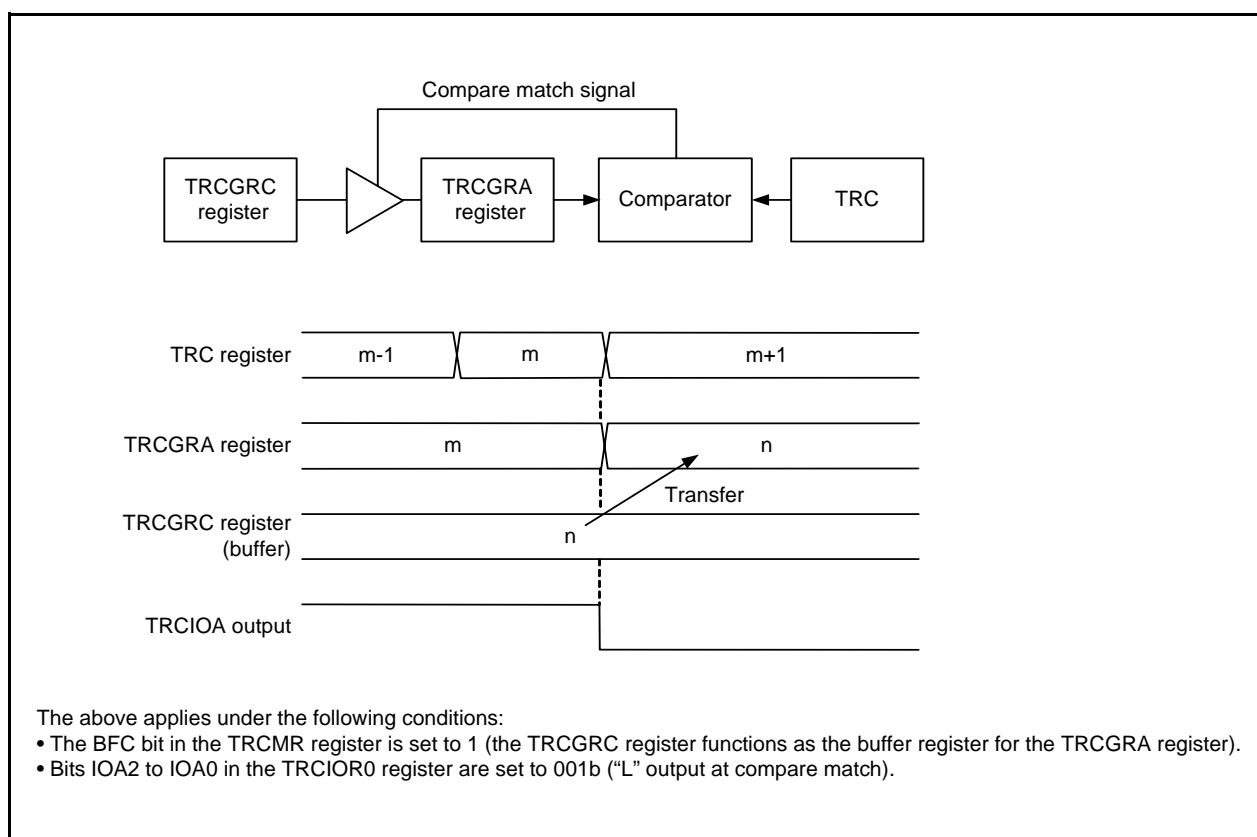

Table 19.6 lists the Buffer Operation in Each Mode, Figure 19.3 shows the Buffer Operation for Input Capture Function, and Figure 19.4 shows the Buffer Operation for Output Compare Function.

**Table 19.6 Buffer Operation in Each Mode**

Function, Mode	Transfer Timing	Transfer Destination Register
Input capture function	Input capture signal input	Contents of TRCGRA (TRCGRB) register are transferred to buffer register
Output compare function	Compare match between TRC register and TRCGRA (TRCGRB) register	Contents of buffer register are transferred to TRCGRA (TRCGRB) register
PWM mode		
PWM2 mode	<ul style="list-style-type: none"> <li>• Compare match between TRC register and TRCGRA register</li> <li>• TRCTRIG pin trigger input</li> </ul>	Contents of buffer register (TRCGRD) are transferred to TRCGRB register

**Figure 19.3 Buffer Operation for Input Capture Function**

**Figure 19.4 Buffer Operation for Output Compare Function**

Make the following settings in timer mode.

- To use the TRCGRC register as the buffer register for the TRCGRA register:  
Set the IOC2 bit in the TRCIOR1 register to the same value as the IOA2 bit in the TRCIOR0 register.
- To use the TRCGRD register as the buffer register for the TRCGRB register:  
Set the IOD2 bit in the TRCIOR1 register to the same value as the IOB2 bit in the TRCIOR0 register.

The output compare function, PWM mode, or PWM2 mode, and the TRCGRC or TRCGRD register is functioning as a buffer register, the IMFC bit or IMFD bit in the TRCSR register is set to 1 when a compare match with the TRC register occurs.

The input capture function and the TRCGRC register or TRCGRD register is functioning as a buffer register, the IMFC bit or IMFD bit in the TRCSR register is set to 1 at the input edge of a signal input to the TRCIO pin or TRCIOD pin.

### 19.3.3 Digital Filter

The input to TRCTR<sub>j</sub> or TRCIO<sub>j</sub> ( $j = A, B, C, \text{ or } D$ ) is sampled, and the level is considered to be determined when three matches occur. The digital filter function and sampling clock are selected using the TRCDF register. Figure 19.5 shows a Digital Filter Block Diagram.

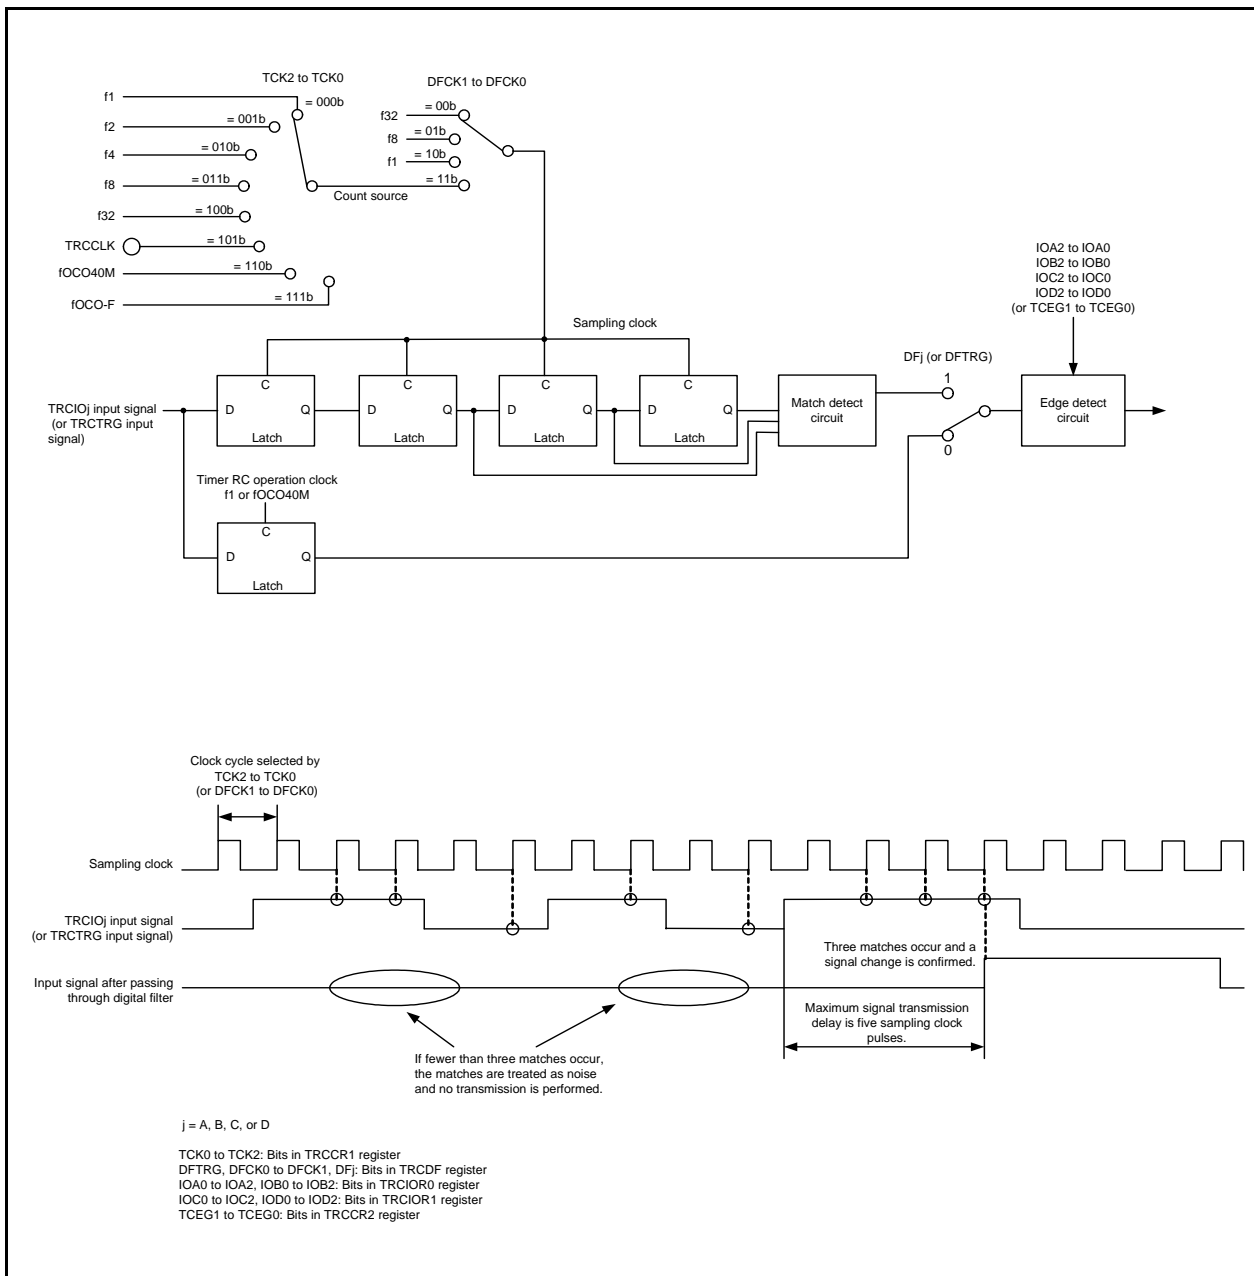

Figure 19.5 Digital Filter Block Diagram

### 19.3.4 Forced Cutoff of Pulse Output

When using the timer mode's output compare function, the PWM mode, or the PWM2 mode, pulse output from the TRCIOj (j = A, B, C, or D) output pin can be forcibly cut off and the TRCIOj pin set to function as a programmable I/O port by means of input to the  $\overline{\text{INT0}}$  pin.

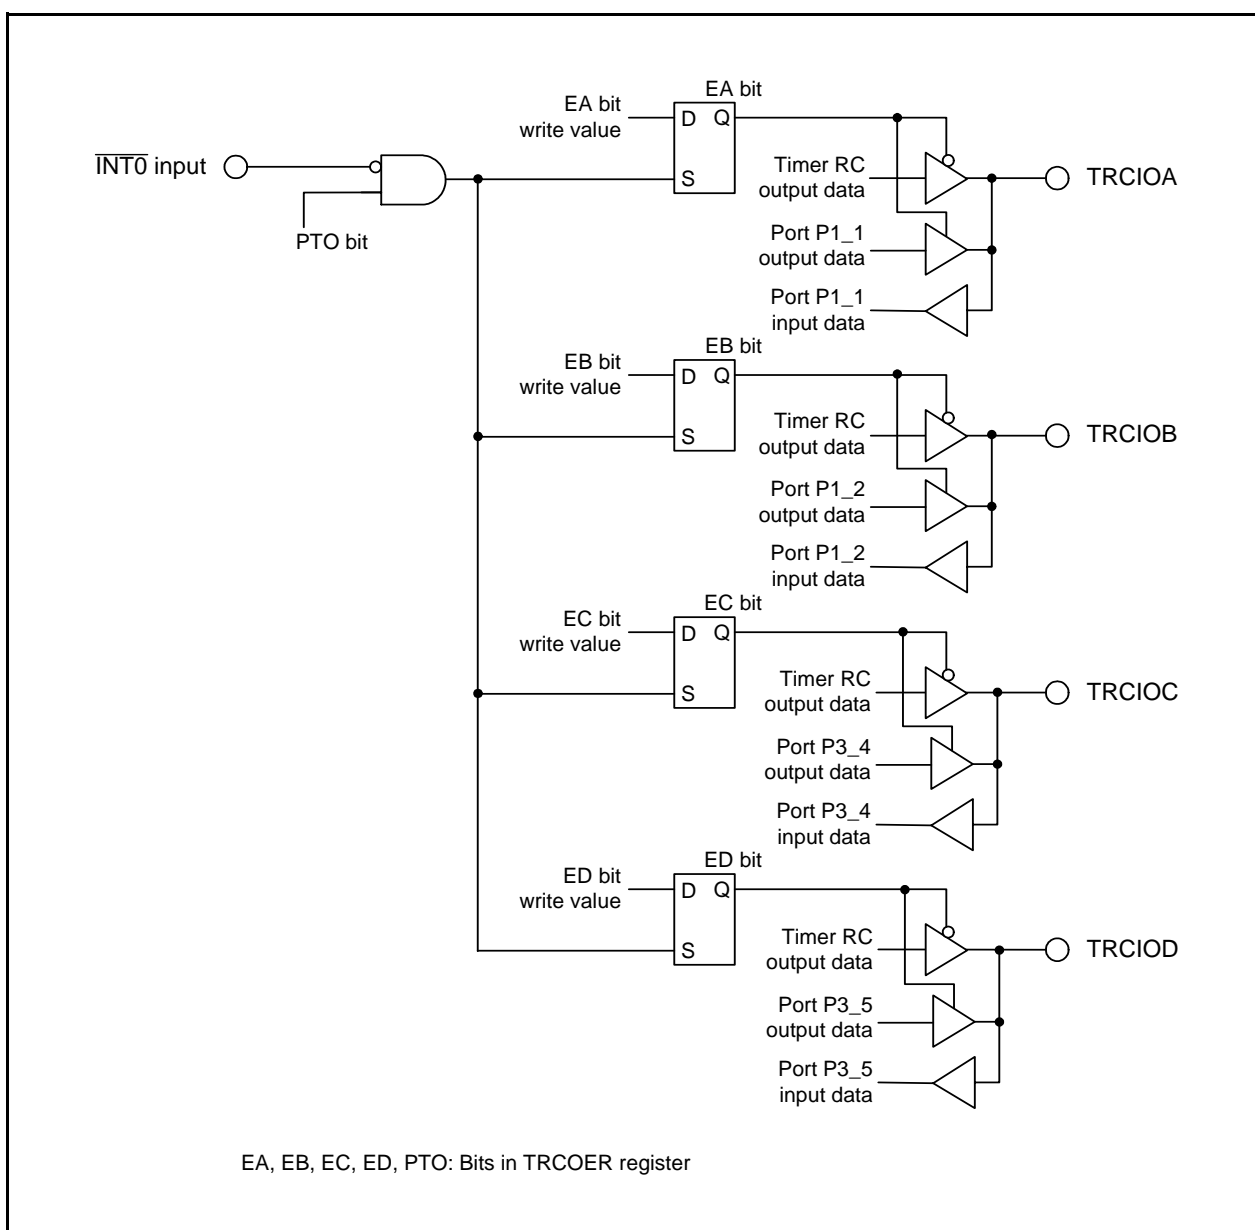

A pin used for output by the timer mode's output compare function, the PWM mode, or the PWM2 mode can be set to function as the timer RC output pin by setting the Ej bit in the TRCOER register to 0 (timer RC output enabled). If "L" is input to the  $\overline{\text{INT0}}$  pin while the PTO bit in the TRCOER register is set to 1 (pulse output forced cutoff signal input  $\overline{\text{INT0}}$  enabled), bits EA, EB, EC, and ED in the TRCOER register are all set to 1 (timer RC output disabled, TRCIOj output pin functions as the programmable I/O port). When one or two cycles of the timer RC operation clock after "L" input to the  $\overline{\text{INT0}}$  pin (refer to **Table 19.1 Timer RC Operation Clock**) has elapsed, the TRCIOj output pin becomes a programmable I/O port.

Make the following settings to use this function:

- Set the pin state following forced cutoff of pulse output (high impedance (input), "L" output, or "H" output). (refer to **7. I/O Ports**).
- Set the INT0EN bit in the INTEN register to 1 ( $\overline{\text{INT0}}$  input enabled) and the INT0PL bit to 0 (one edge), and set the POL bit in the INT0IC register to 0 (falling edge selected).
- Set the PD4\_5 bit in the PD4 register to 0 (input mode).
- Select the  $\overline{\text{INT0}}$  digital filter by bits INT0F1 to INT0F0 in the INTF register.
- Set the PTO bit in the TRCOER register to 1 (pulse output forced cutoff signal input  $\overline{\text{INT0}}$  enabled).

The IR bit in the INT0IC register is set to 1 (interrupt request) in accordance with the setting of the POL bit in the INT0IC register and the INT0PL bit in the INTEN register, and a change in the  $\overline{\text{INT0}}$  pin input (refer to **11.9 Notes on Interrupts**).

For details on interrupts, refer to **11. Interrupts**.

**Figure 19.6** Forced Cutoff of Pulse Output

## 19.4 Timer Mode (Input Capture Function)

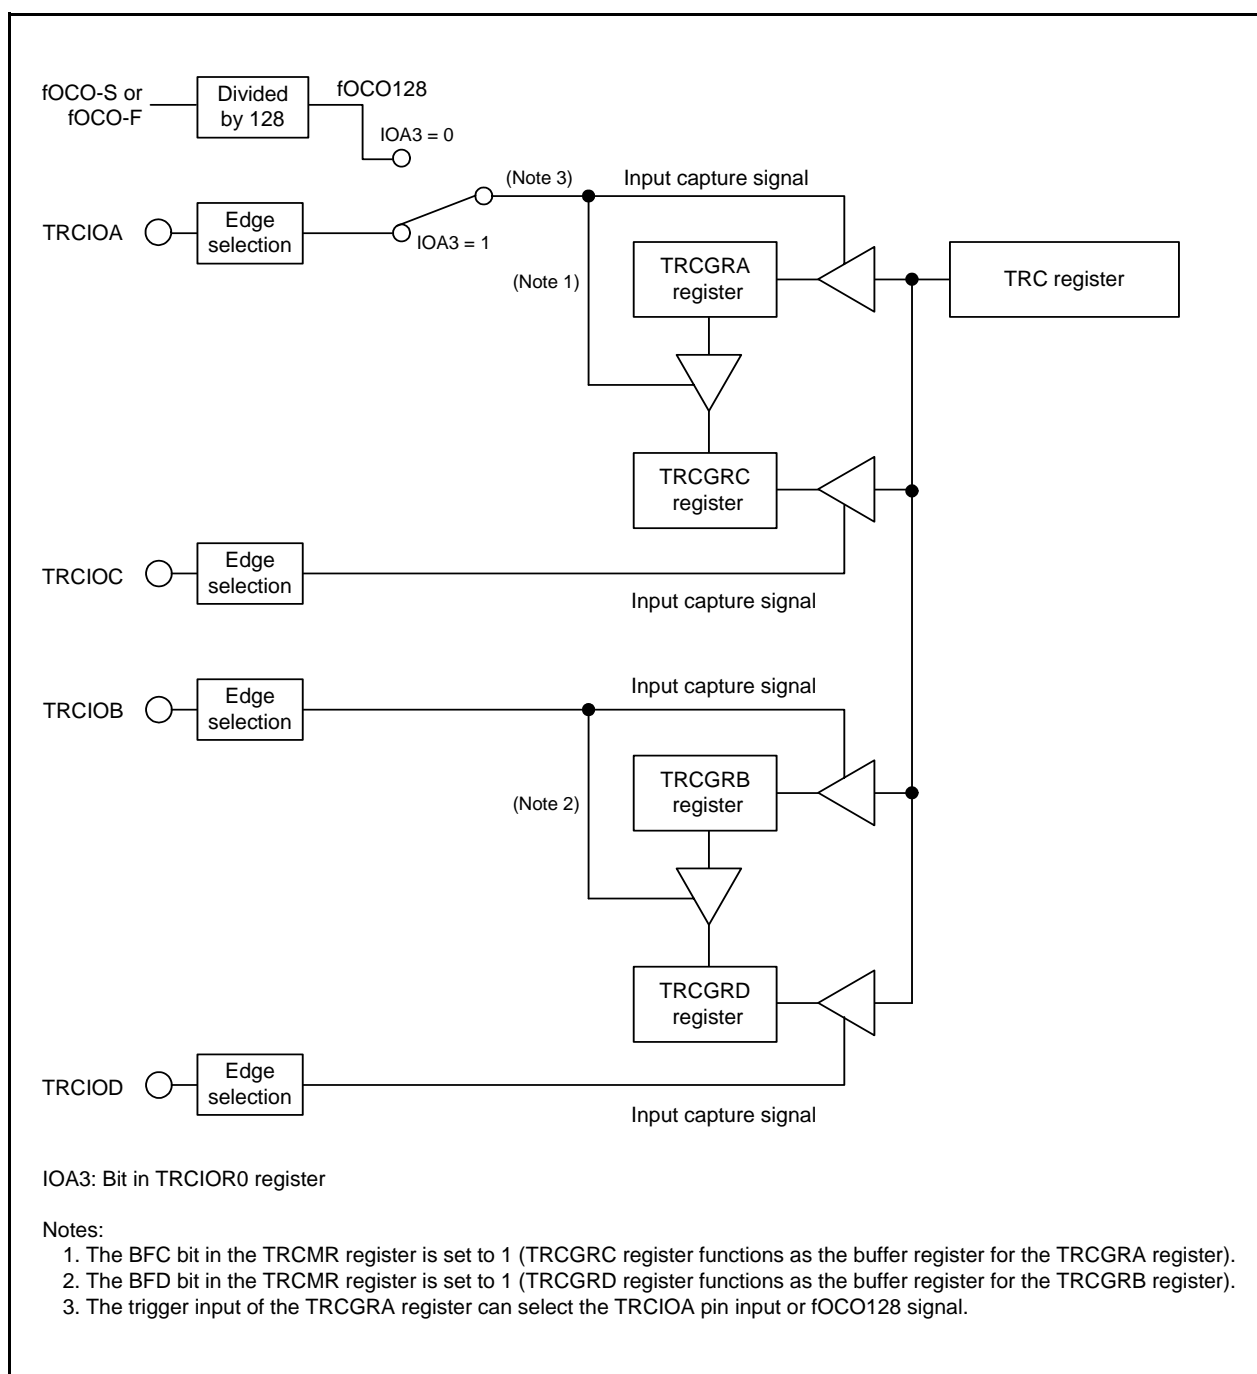

This function measures the width or period of an external signal. An external signal input to the TRCIOj (j = A, B, C, or D) pin acts as a trigger for transferring the contents of the TRC register (counter) to the TRCGRj register (input capture). The input capture function, or any other mode or function, can be selected for each individual pin. The TRCGRA register can also select fOCO128 signal as input-capture trigger input.

Table 19.7 lists the Specifications of Input Capture Function, Figure 19.7 shows a Block Diagram of Input Capture Function, Table 19.8 lists the Functions of TRCGRj Register when Using Input Capture Function, and Figure 19.8 shows an Operating Example of Input Capture Function.

**Table 19.7 Specifications of Input Capture Function**

Item	Specification
Count source	f1, f2, f4, f8, f32, fOCO40M, fOCO-F, or external signal (rising edge) input to TRCCLK pin
Count operation	Increment
Count period	<ul style="list-style-type: none"> <li>The CCLR bit in the TRCCR1 register is set to 0 (free running operation):  <math>1/f_k \times 65,536</math>  <math>f_k</math>: Count source frequency</li> <li>The CCLR bit in the TRCCR1 register is set to 1 (TRC register set to 0000h at TRCGRA compare match):  <math>1/f_k \times (n+1)</math>  <math>n</math>: TRCGRA register setting value</li> </ul>
Count start condition	1 (count starts) is written to the TSTART bit in the TRCMR register.
Count stop condition	0 (count stops) is written to the TSTART bit in the TRCMR register. The TRC register retains a value before count stops.
Interrupt request generation timing	<ul style="list-style-type: none"> <li>Input capture (valid edge of TRCIOj input or fOCO128 signal edge)</li> <li>The TRC register overflows.</li> </ul>
TRCIOA, TRCIOB, TRCIOC, and TRCIOD pin functions	Programmable I/O port or input capture input (selectable individually for each pin)
INT0 pin function	Programmable I/O port or $\overline{\text{INT0}}$ interrupt input
Read from timer	The count value can be read by reading TRC register.
Write to timer	The TRC register can be written to.
Select functions	<ul style="list-style-type: none"> <li>Input capture input pin selection One or more of pins TRCIOA, TRCIOB, TRCIOC, and TRCIOD</li> <li>Input capture input valid edge selection Rising edge, falling edge, or both rising and falling edges</li> <li>Buffer operation (Refer to <b>19.3.2 Buffer Operation.</b>)</li> <li>Digital filter (Refer to <b>19.3.3 Digital Filter.</b>)</li> <li>Timing for setting the TRC register to 0000h Overflow or input capture</li> <li>Input-capture trigger selected fOCO128 can be selected for input-capture trigger input of the TRCGRA register.</li> </ul>

j = A, B, C, or D

### 19.4.3 Operating Example

**Figure 19.8** Operating Example of Input Capture Function

## 19.5 Timer Mode (Output Compare Function)

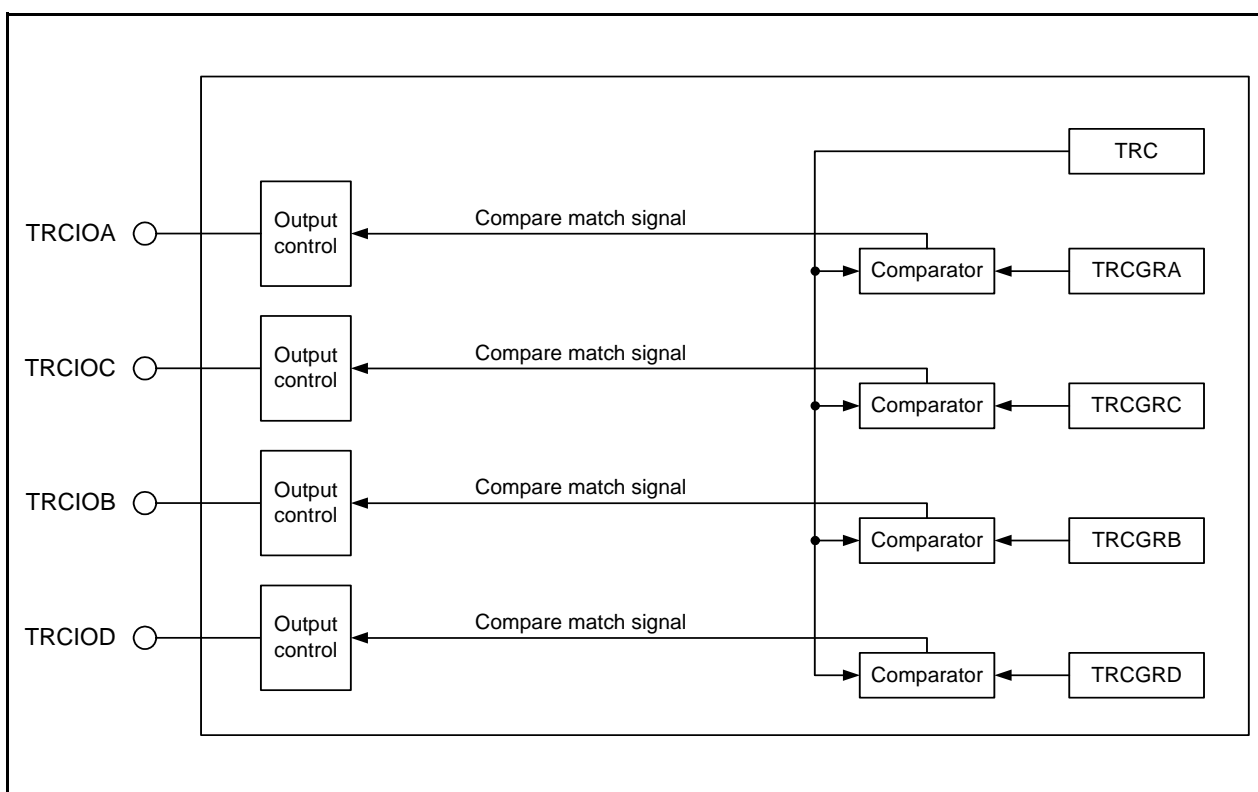

This function detects when the contents of the TRC register (counter) and the TRCGRj register (j = A, B, C, or D) match (compare match). When a match occurs a signal is output from the TRCIOj pin at a given level. The output compare function, or other mode or function, can be selected for each individual pin.

Table 19.9 lists the Specifications of Output Compare Function, Figure 19.9 shows a Block Diagram of Output Compare Function, Table 19.10 lists the Functions of TRCGRj Register when Using Output Compare Function, and Figure 19.10 shows an Operating Example of Output Compare Function.

**Table 19.9 Specifications of Output Compare Function**

Item	Specification
Count source	f1, f2, f4, f8, f32, fOCO40M, fOCO-F, or external signal (rising edge) input to TRCCLK pin
Count operation	Increment
Count period	<ul style="list-style-type: none"> <li>The CCLR bit in the TRCCR1 register is set to 0 (free running operation):  <math>1/f_k \times 65,536</math>  <math>f_k</math>: Count source frequency</li> <li>The CCLR bit in the TRCCR1 register is set to 1 (TRC register set to 0000h at TRCGRA compare match):  <math>1/f_k \times (n+1)</math>  <math>n</math>: TRCGRA register setting value</li> </ul>
Waveform output timing	Compare match
Count start condition	1 (count starts) is written to the TSTART bit in the TRCMR register.
Count stop condition	<ul style="list-style-type: none"> <li>When the CSEL bit in the TRCCR2 register is set to 0 (count continues after compare match with TRCGRA).  0 (count stops) is written to the TSTART bit in the TRCMR register.  The output compare output pin retains output level before count stops, the TRC register retains a value before count stops.</li> <li>When the CSEL bit in the TRCCR2 register is set to 1 (count stops at compare match with TRCGRA register).  The count stops at the compare match with the TRCGRA register. The output compare output pin retains the level after the output is changed by the compare match.</li> </ul>
Interrupt request generation timing	<ul style="list-style-type: none"> <li>Compare match (contents of registers TRC and TRCGRj match)</li> <li>The TRC register overflows.</li> </ul>

Notes:

1. Enabled when in PWM mode.
2. Enabled when in output compare function, PWM mode, or PWM2 mode. For notes on PWM2 mode, refer to **19.9.6 TRCMR Register in PWM2 Mode**.
3. Enabled when in PWM2 mode.

### 19.5.5 Operating Example

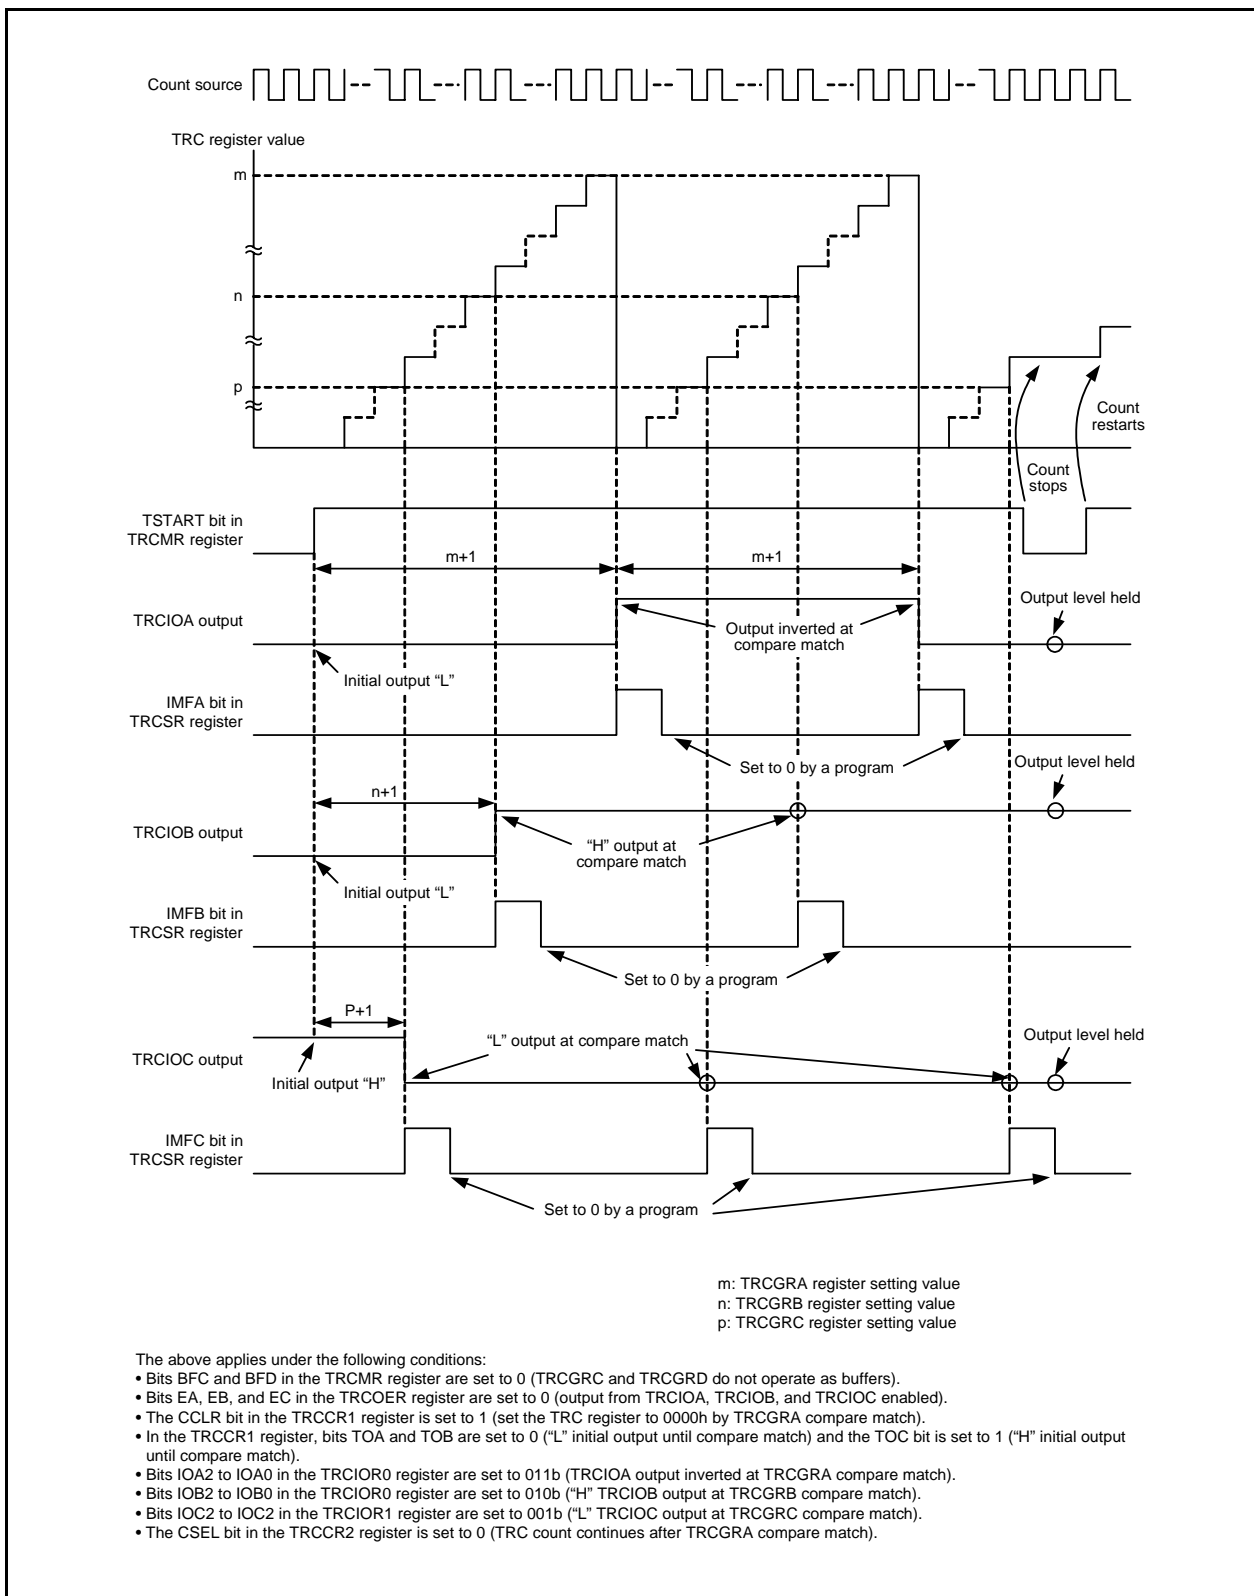

Figure 19.10 Operating Example of Output Compare Function

### 19.5.6 Changing Output Pins in Registers TRCGRC and TRCGRD

The TRCGRC register can be used for output control of the TRCIOA pin, and the TRCGRD register can be used for output control of the TRCIOB pin. Therefore, each pin output can be controlled as follows:

- TRCIOA output is controlled by the values in registers TRCGRA and TRCGRC.
- TRCIOB output is controlled by the values in registers TRCGRB and TRCGRD.

Change output pins in registers TRCGRC and TRCGRD as follows:

- Set the IOC3 bit in the TRCIOR1 register to 0 (TRCIOA output register) and set the IOD3 bit to 0 (TRCIOB output register).
- Set bits BFC and BFD in the TRCMR register to 0 (general register).
- Set different values in registers TRCGRC and TRCGRA. Also, set different values in registers TRCGRD and TRCGRB.

Figure 19.12 shows an Operating Example When TRCGRC Register is Used for Output Control of TRCIOA Pin and TRCGRD Register is Used for Output Control of TRCIOB Pin.

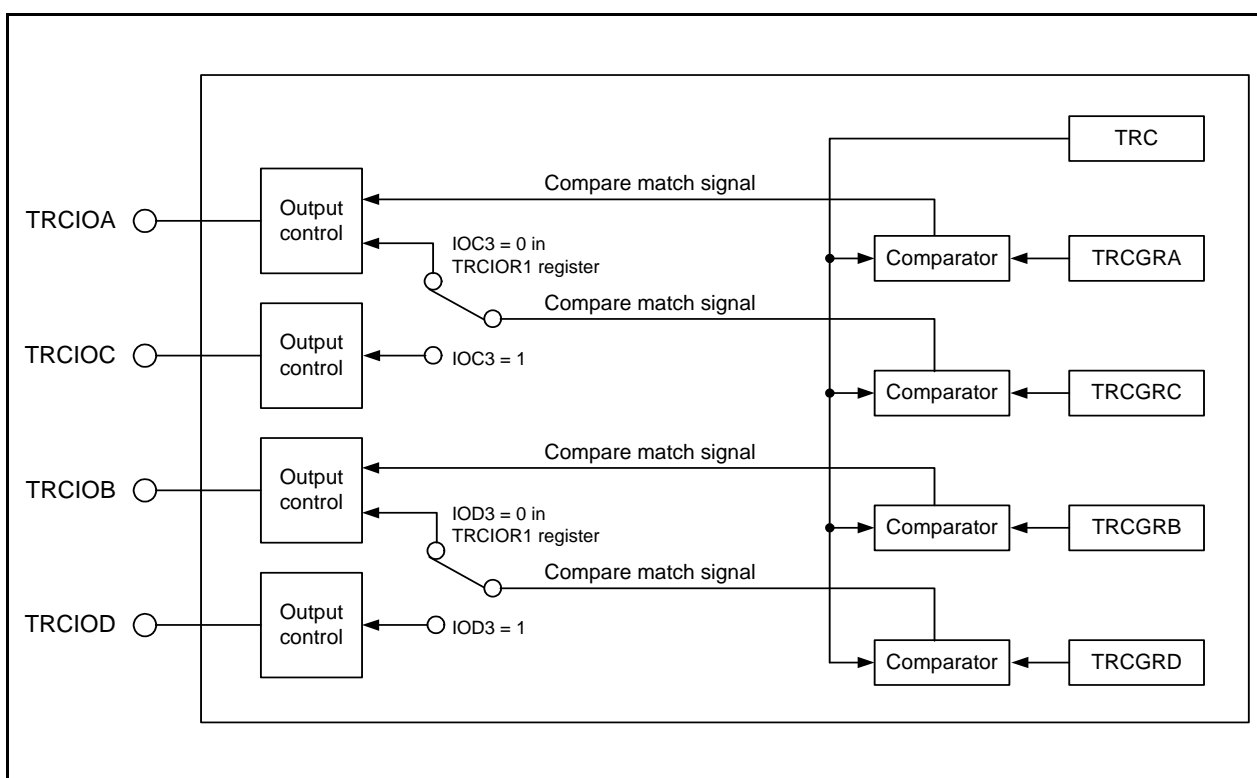

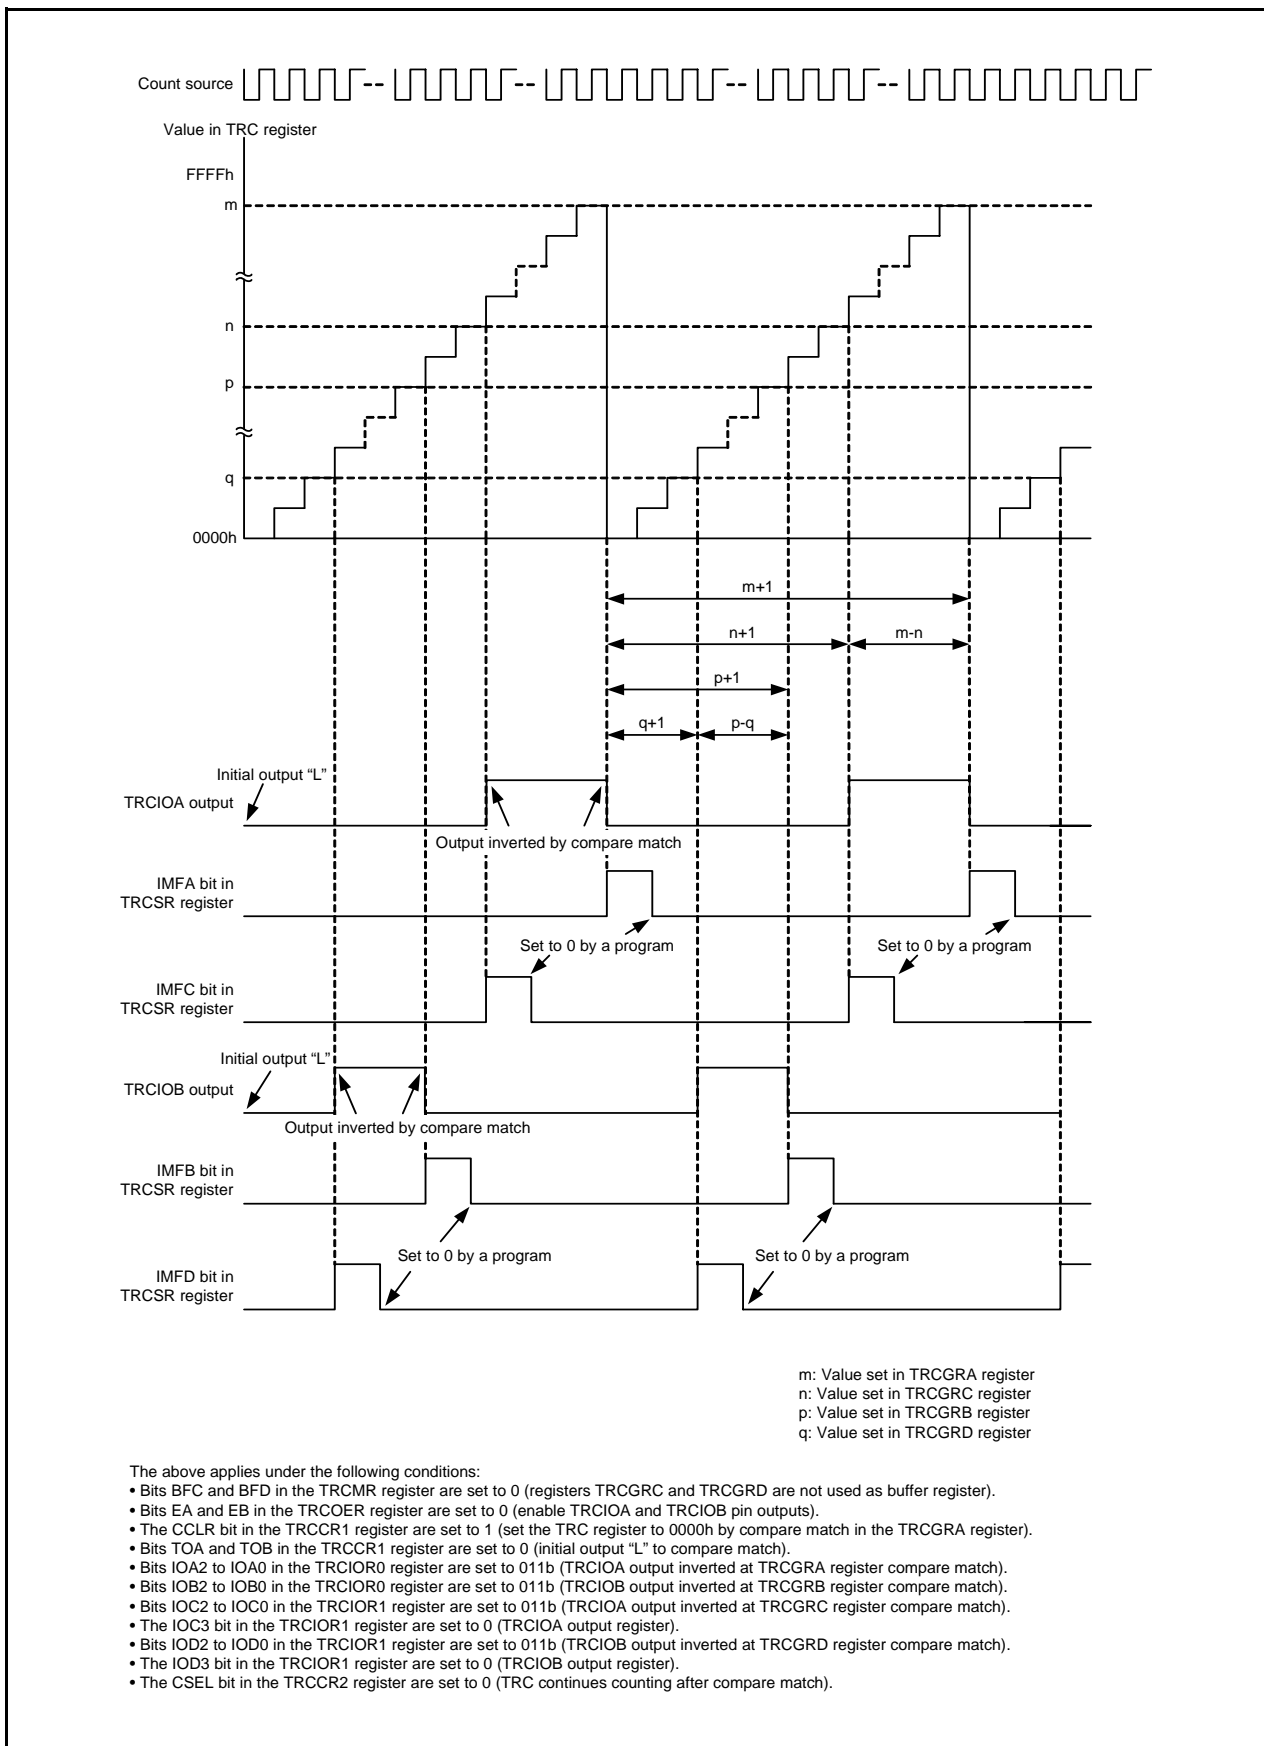

Figure 19.11 Changing Output Pins in Registers TRCGRC and TRCGRD

**Figure 19.12 Operating Example When TRCGRC Register is Used for Output Control of TRCIOA Pin and TRCGRD Register is Used for Output Control of TRCIOB Pin**

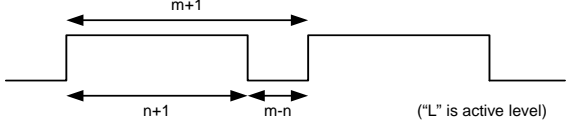

## 19.6 PWM Mode

This mode outputs PWM waveforms. A maximum of three PWM waveforms with the same period are output.

The PWM mode, or the timer mode, can be selected for each individual pin. (However, since the TRCGRA register is used when using any pin for the PWM mode, the TRCGRA register cannot be used for the timer mode.)

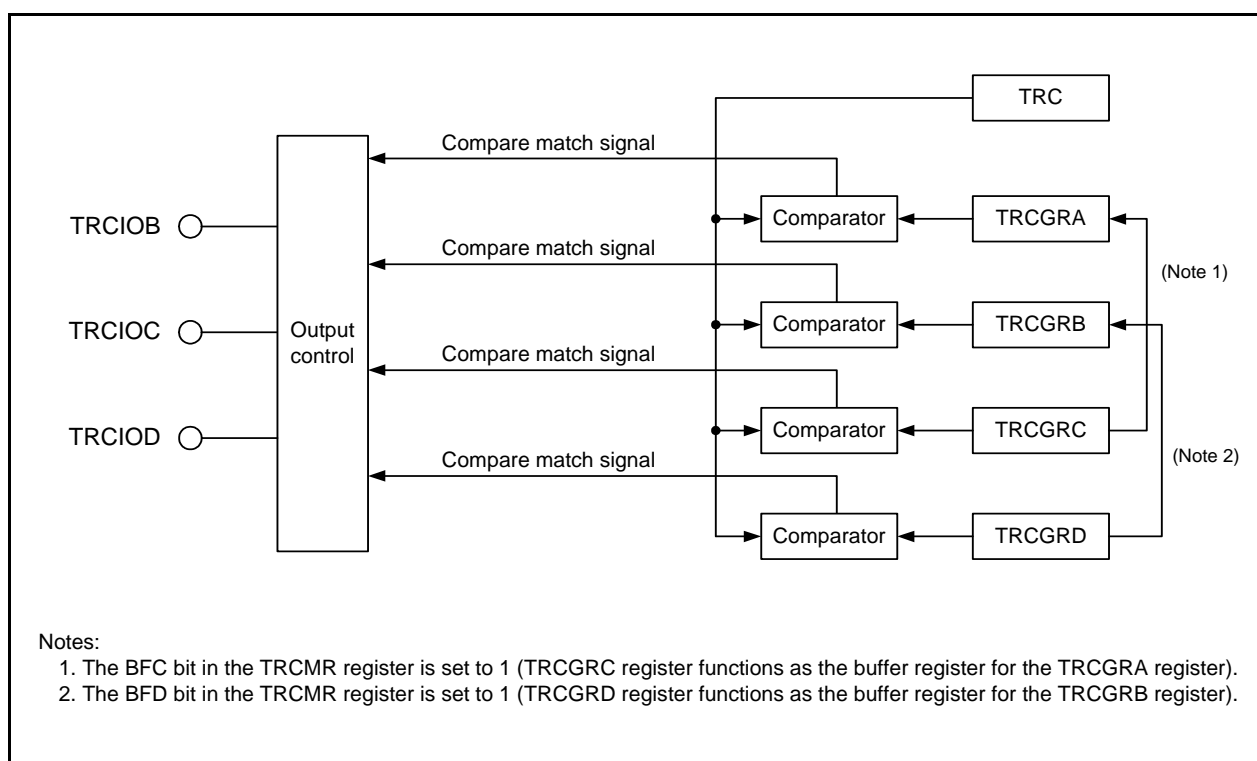

Table 19.11 lists the Specifications of PWM Mode, Figure 19.13 shows a PWM Mode Block Diagram, Table 19.12 lists the Functions of TRCGRh Register in PWM Mode, and Figures 19.14 and 19.15 show Operating Examples of PWM Mode.

**Table 19.11 Specifications of PWM Mode**

Item	Specification
Count source	f1, f2, f4, f8, f32, fOCO40M, fOCO-F, or external signal (rising edge) input to TRCCLK pin
Count operation	Increment
PWM waveform	PWM period: $1/f_k \times (m+1)$ Active level width: $1/f_k \times (m-n)$ Inactive width: $1/f_k \times (n+1)$ $f_k$ : Count source frequency $m$ : TRCGRA register setting value $n$ : TRCGRj register setting value 
Count start condition	1 (count starts) is written to the TSTART bit in the TRCMR register.
Count stop condition	<ul style="list-style-type: none"> <li>When the CSEL bit in the TRCCR2 register is set to 0 (count continues after compare match with TRCGRA). 0 (count stops) is written to the TSTART bit in the TRCMR register. PWM output pin retains output level before count stops, TRC register retains value before count stops.</li> <li>When the CSEL bit in the TRCCR2 register is set to 1 (count stops at compare match with TRCGRA register). The count stops at the compare match with the TRCGRA register. The PWM output pin retains the level after the output is changed by the compare match.</li> </ul>
Interrupt request generation timing	<ul style="list-style-type: none"> <li>Compare match (contents of registers TRC and TRCGRh match)</li> <li>The TRC register overflows.</li> </ul>
TRCIOA pin function	Programmable I/O port
TRCIOB, TRCIOC, and TRCIOD pin functions	Programmable I/O port or PWM output (selectable individually for each pin)
INT0 pin function	Programmable I/O port, pulse output forced cutoff signal input, or $\overline{\text{INT0}}$ interrupt input
Read from timer	The count value can be read by reading the TRC register.
Write to timer	The TRC register can be written to.
Select functions	<ul style="list-style-type: none"> <li>One to three pins selectable as PWM output pins One or more of pins TRCIOB, TRCIOC, and TRCIOD</li> <li>Active level selectable for each pin</li> <li>Initial level selectable for each pin</li> <li>Buffer operation (Refer to <b>19.3.2 Buffer Operation</b>.)</li> <li>Pulse output forced cutoff signal input (Refer to <b>19.3.4 Forced Cutoff of Pulse Output</b>.)</li> <li>A/D trigger generation</li> </ul>

j = B, C, or D

h = A, B, C, or D

b7	TCEG1			R/W

Notes:

1. Enabled when in PWM mode.
2. Enabled when in output compare function, PWM mode, or PWM2 mode. For notes on PWM2 mode, refer to **19.9.6 TRCMR Register in PWM2 Mode.**
3. In timer mode and PWM mode these bits are disabled.

**Table 19.12 Functions of TRCGRh Register in PWM Mode**

Register	Setting	Register Function	PWM Output Pin
TRCGRA	—	General register. Set the PWM period.	—
TRCGRB	—	General register. Set the PWM output change point.	TRCIOB
TRCGRC	BFC = 0	General register. Set the PWM output change point.	TRCIOC
TRCGRD	BFD = 0		TRCIOD
TRCGRC	BFC = 1	Buffer register. Set the next PWM period. (Refer to <b>19.3.2 Buffer Operation.</b> )	—
TRCGRD	BFD = 1	Buffer register. Set the next PWM output change point. (Refer to <b>19.3.2 Buffer Operation.</b> )	TRCIOB

h = A, B, C, or D

BFC, BFD: Bits in TRCMR register

Note:

1. The output level does not change even when a compare match occurs if the TRCGRA register value (PWM period) is the same as the TRCGRB, TRCGRC, or TRCGRD register value.

### 19.6.3 Operating Example

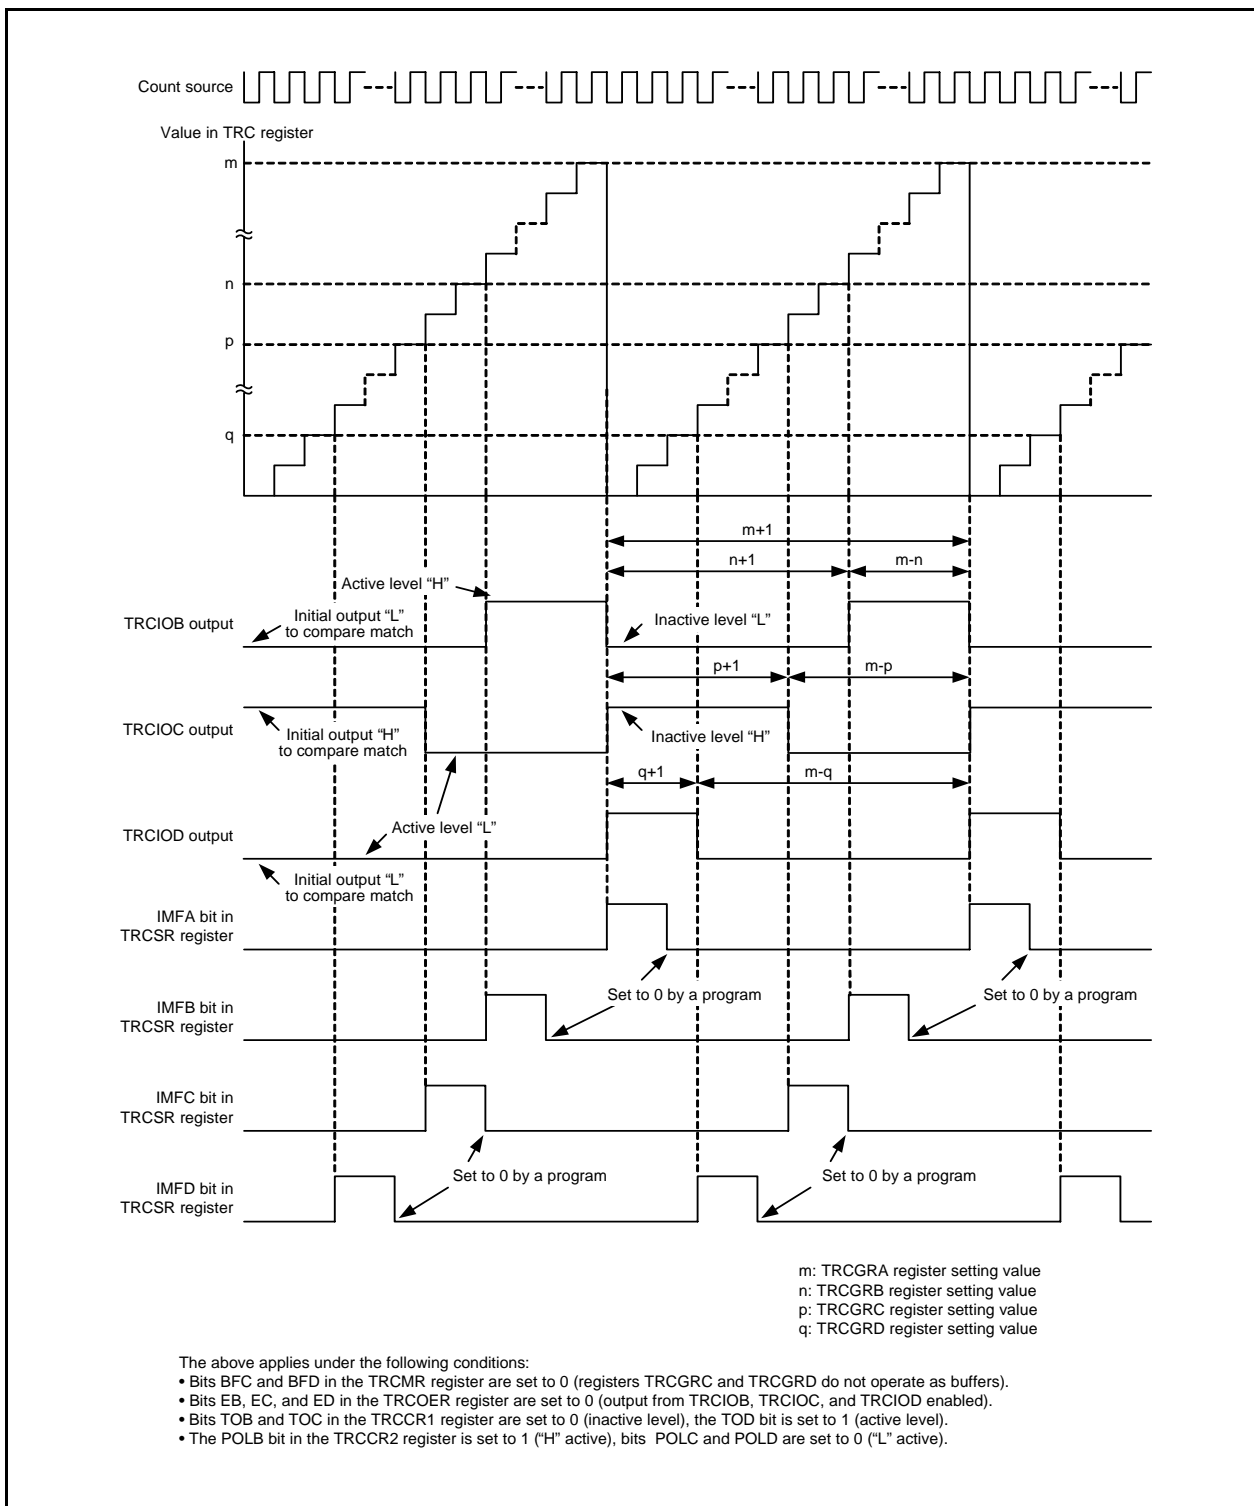

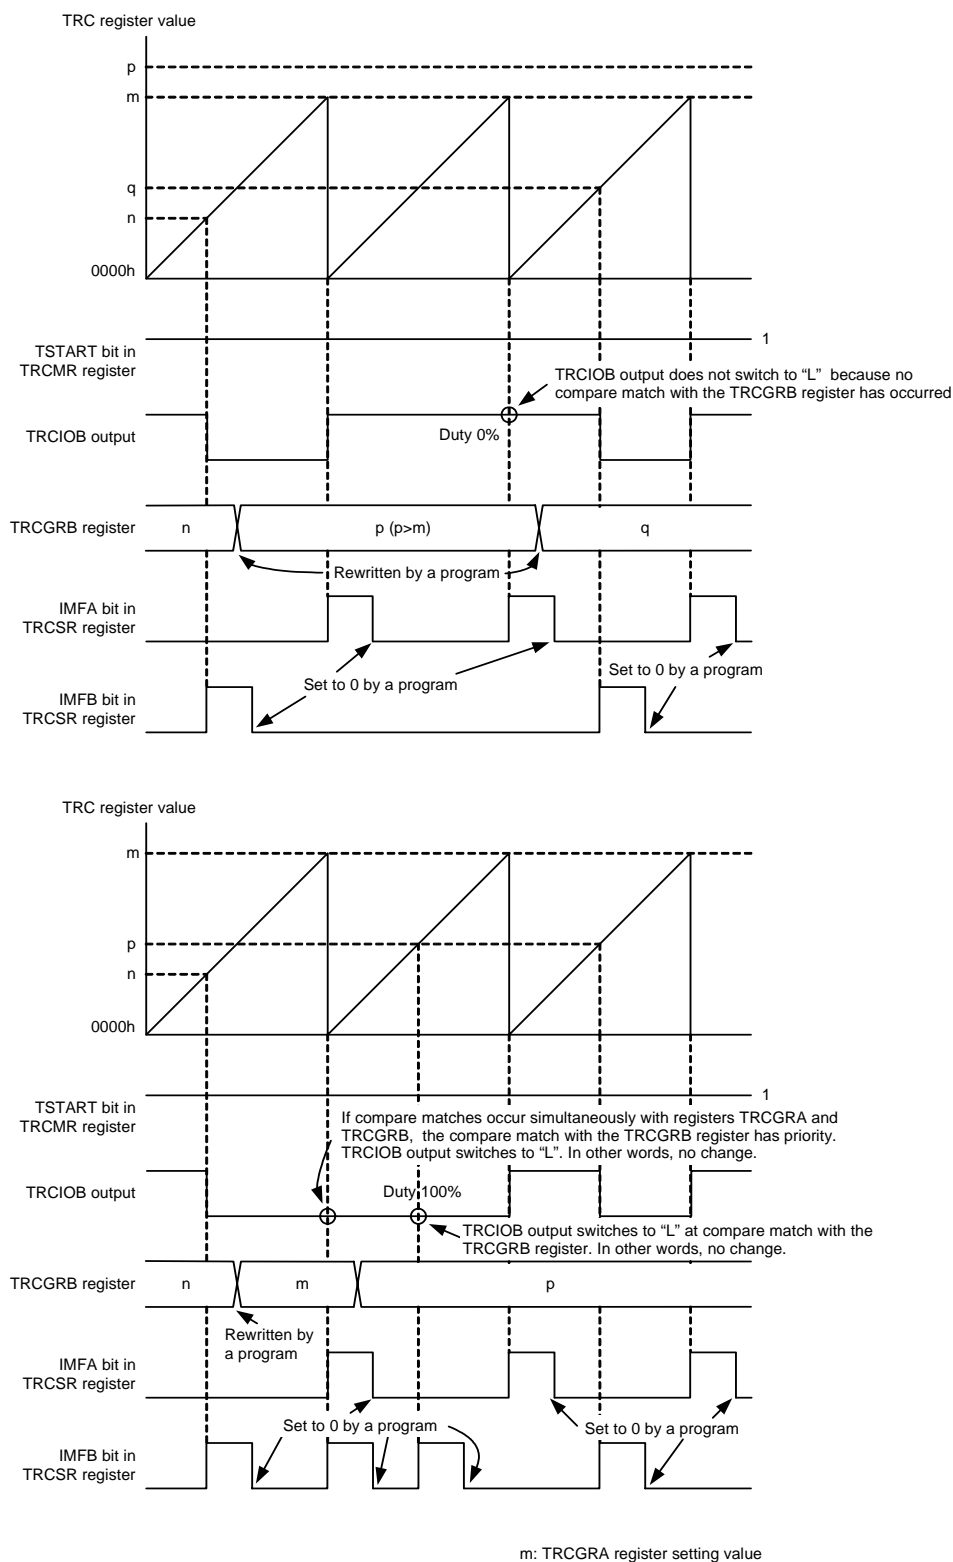

Figure 19.14 Operating Example of PWM Mode

The above applies under the following conditions:

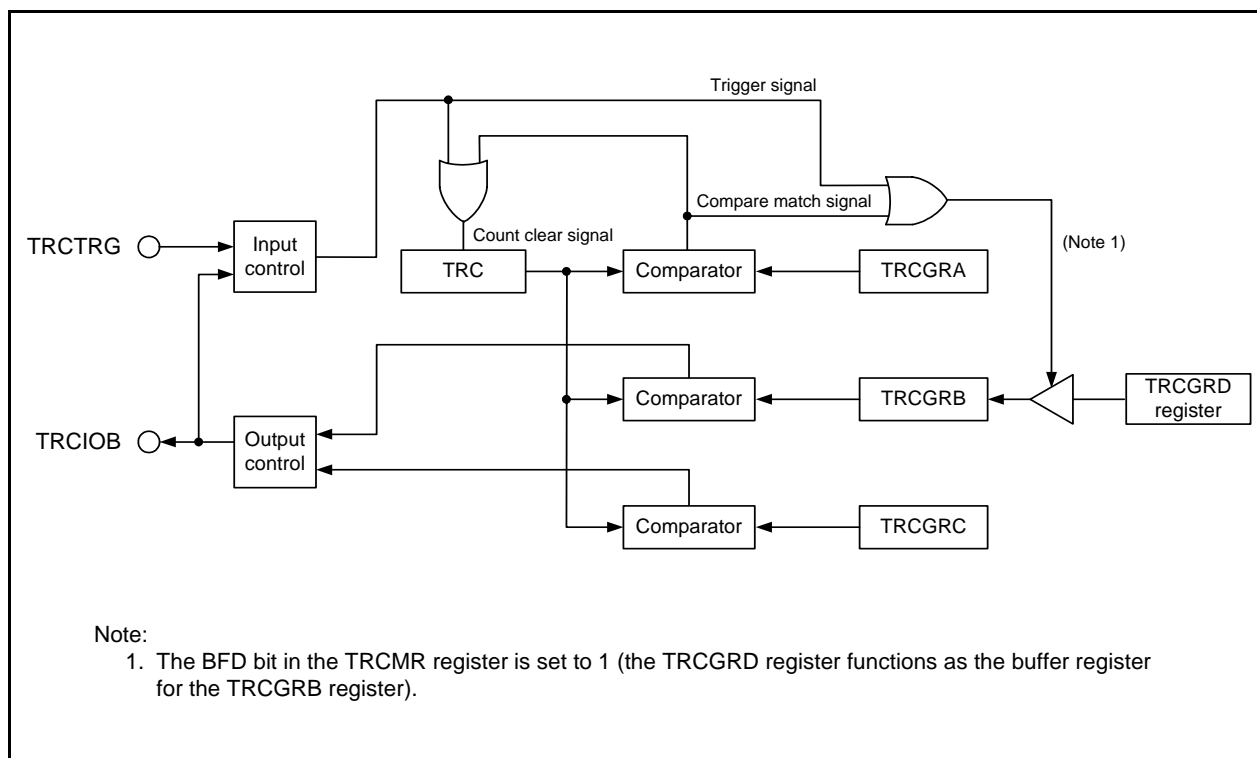

- The EB bit in the TRCOER register is set to 0 (output from TRCIOB enabled).
- The POLB bit in the TRCCR2 register is set to 0 ("L" active).

**Figure 19.15 Operating Example of PWM Mode (Duty 0% and Duty 100%)**

## 19.7 PWM2 Mode

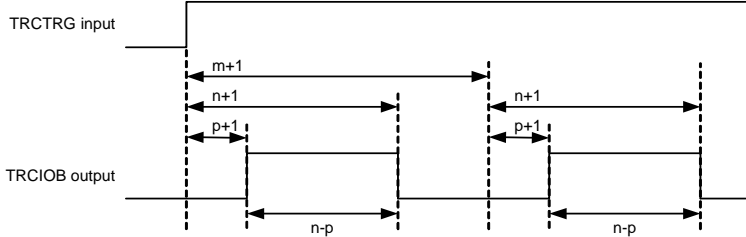

This mode outputs a single PWM waveform. After a given wait duration has elapsed following the trigger, the pin output switches to active level. Then, after a given duration, the output switches back to inactive level. Furthermore, the counter stops at the same time the output returns to inactive level, making it possible to use PWM2 mode to output a programmable wait one-shot waveform.

Since timer RC uses multiple general registers in PWM2 mode, other modes cannot be used in conjunction with it. Figure 19.16 shows a PWM2 Mode Block Diagram, Table 19.13 lists the Specifications of PWM2 Mode, Table 19.14 lists the Functions of TRCGRj Register in PWM2 Mode, and Figures 19.17 to 19.19 show Operating Examples of PWM2 Mode.

**Figure 19.16 PWM2 Mode Block Diagram**

**Table 19.13 Specifications of PWM2 Mode**

Item	Specification
Count source	f1, f2, f4, f8, f32, fOCO40M, fOCO-F, or external signal (rising edge) input to TRCCLK pin

b7	DFCK1			R/W

Notes:

- These bits are enabled for the input capture function.
- These bits are enabled when in PWM2 mode and bits TCEG1 to TCEG0 in the TRCCR2 register are set to 01b, 10b, or 11b (TRCTRG trigger input enabled).

**Table 19.14 Functions of TRCGRj Register in PWM2 Mode**

Register	Setting	Register Function	PWM2 Output Pin
TRCGRA	—	General register. Set the PWM period.	TRCIOB pin
TRCGRB <sup>(1)</sup>	—	General register. Set the PWM output change point.	
TRCGRC <sup>(1)</sup>	BFC = 0	General register. Set the PWM output change point (wait time after trigger).	
TRCGRD	BFD = 0	(Not used in PWM2 mode)	—
TRCGRD	BFD = 1	Buffer register. Set the next PWM output change point. (Refer to <b>19.3.2 Buffer Operation.</b> )	TRCIOB pin

j = A, B, C, or D

BFC, BFD: Bits in TRCMR register

Note:

- Do not set the TRCGRB and TRCGRC registers to the same value.

## 19.7.4 Operating Example

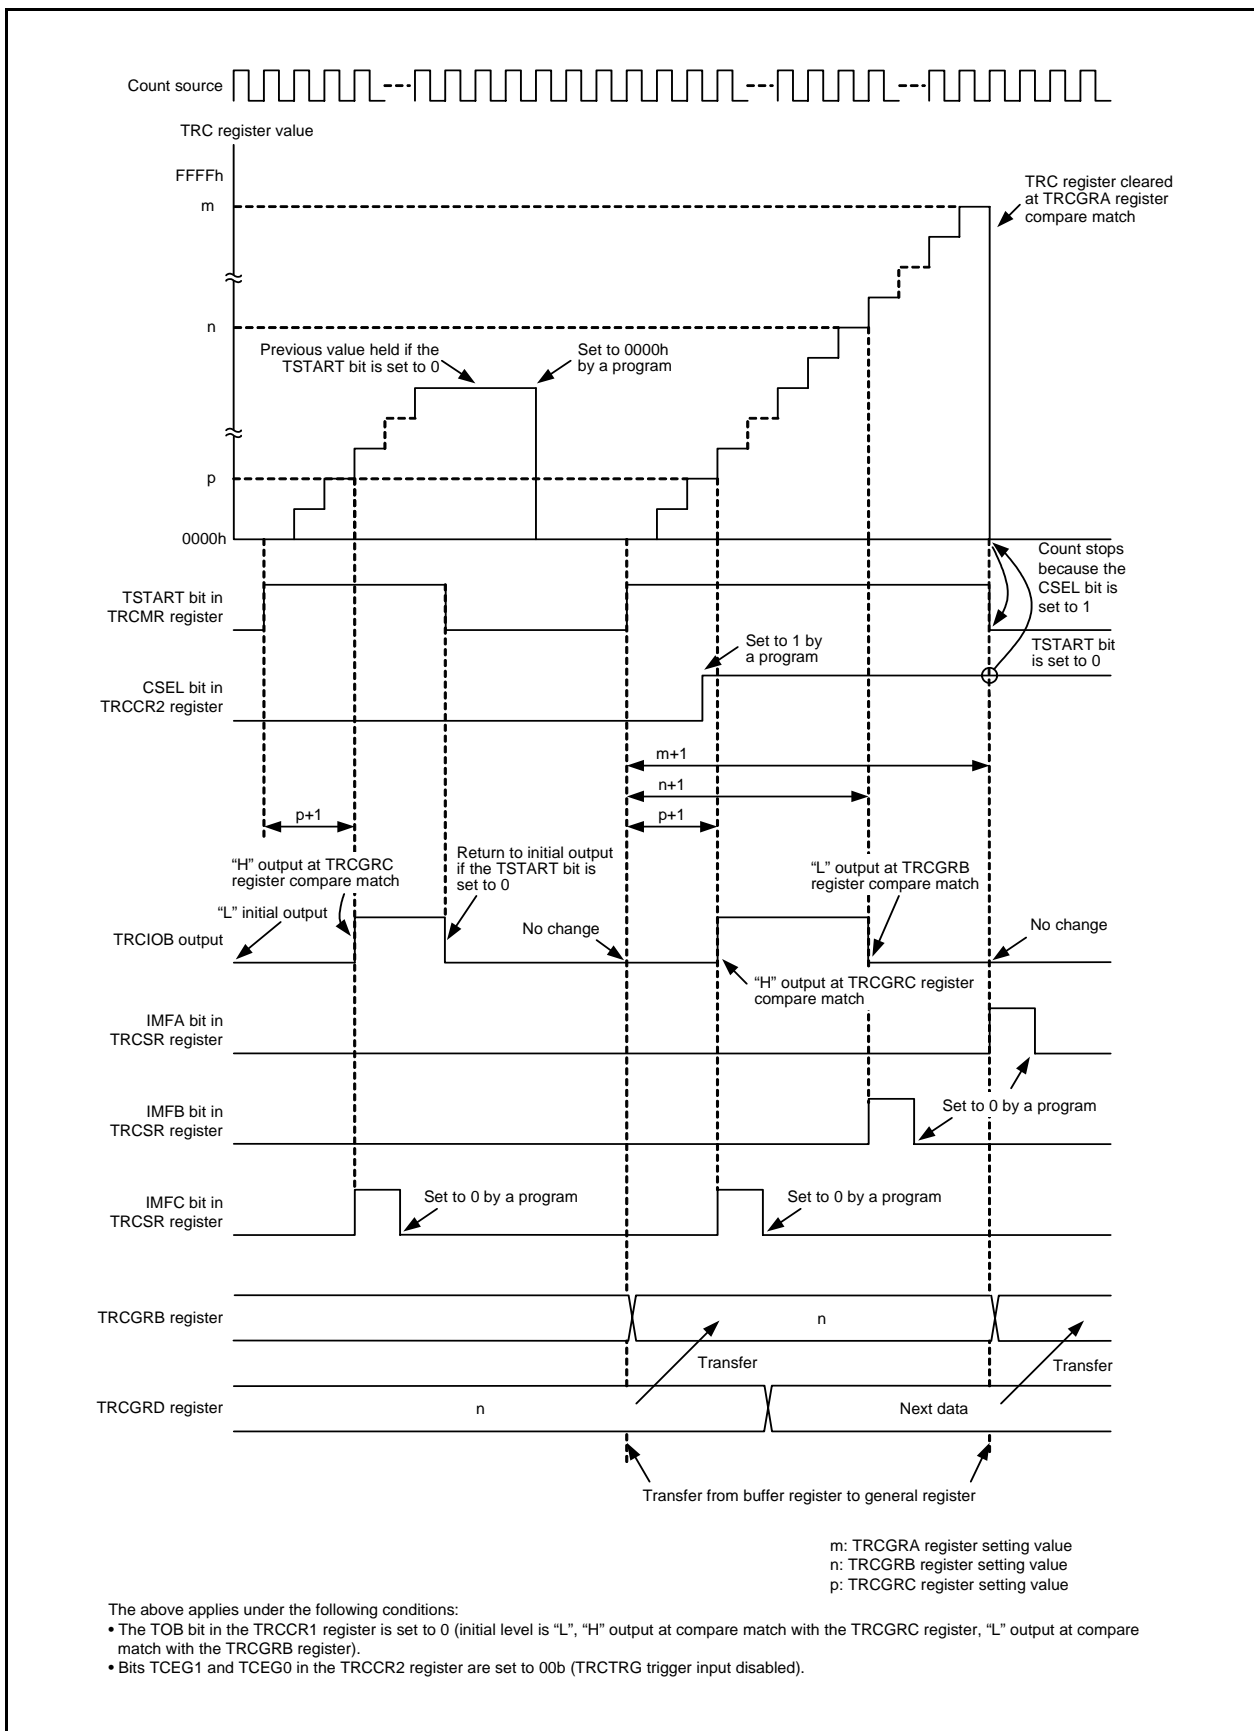

Figure 19.17 Operating Example of PWM2 Mode (TRCTRIG Trigger Input Disabled)

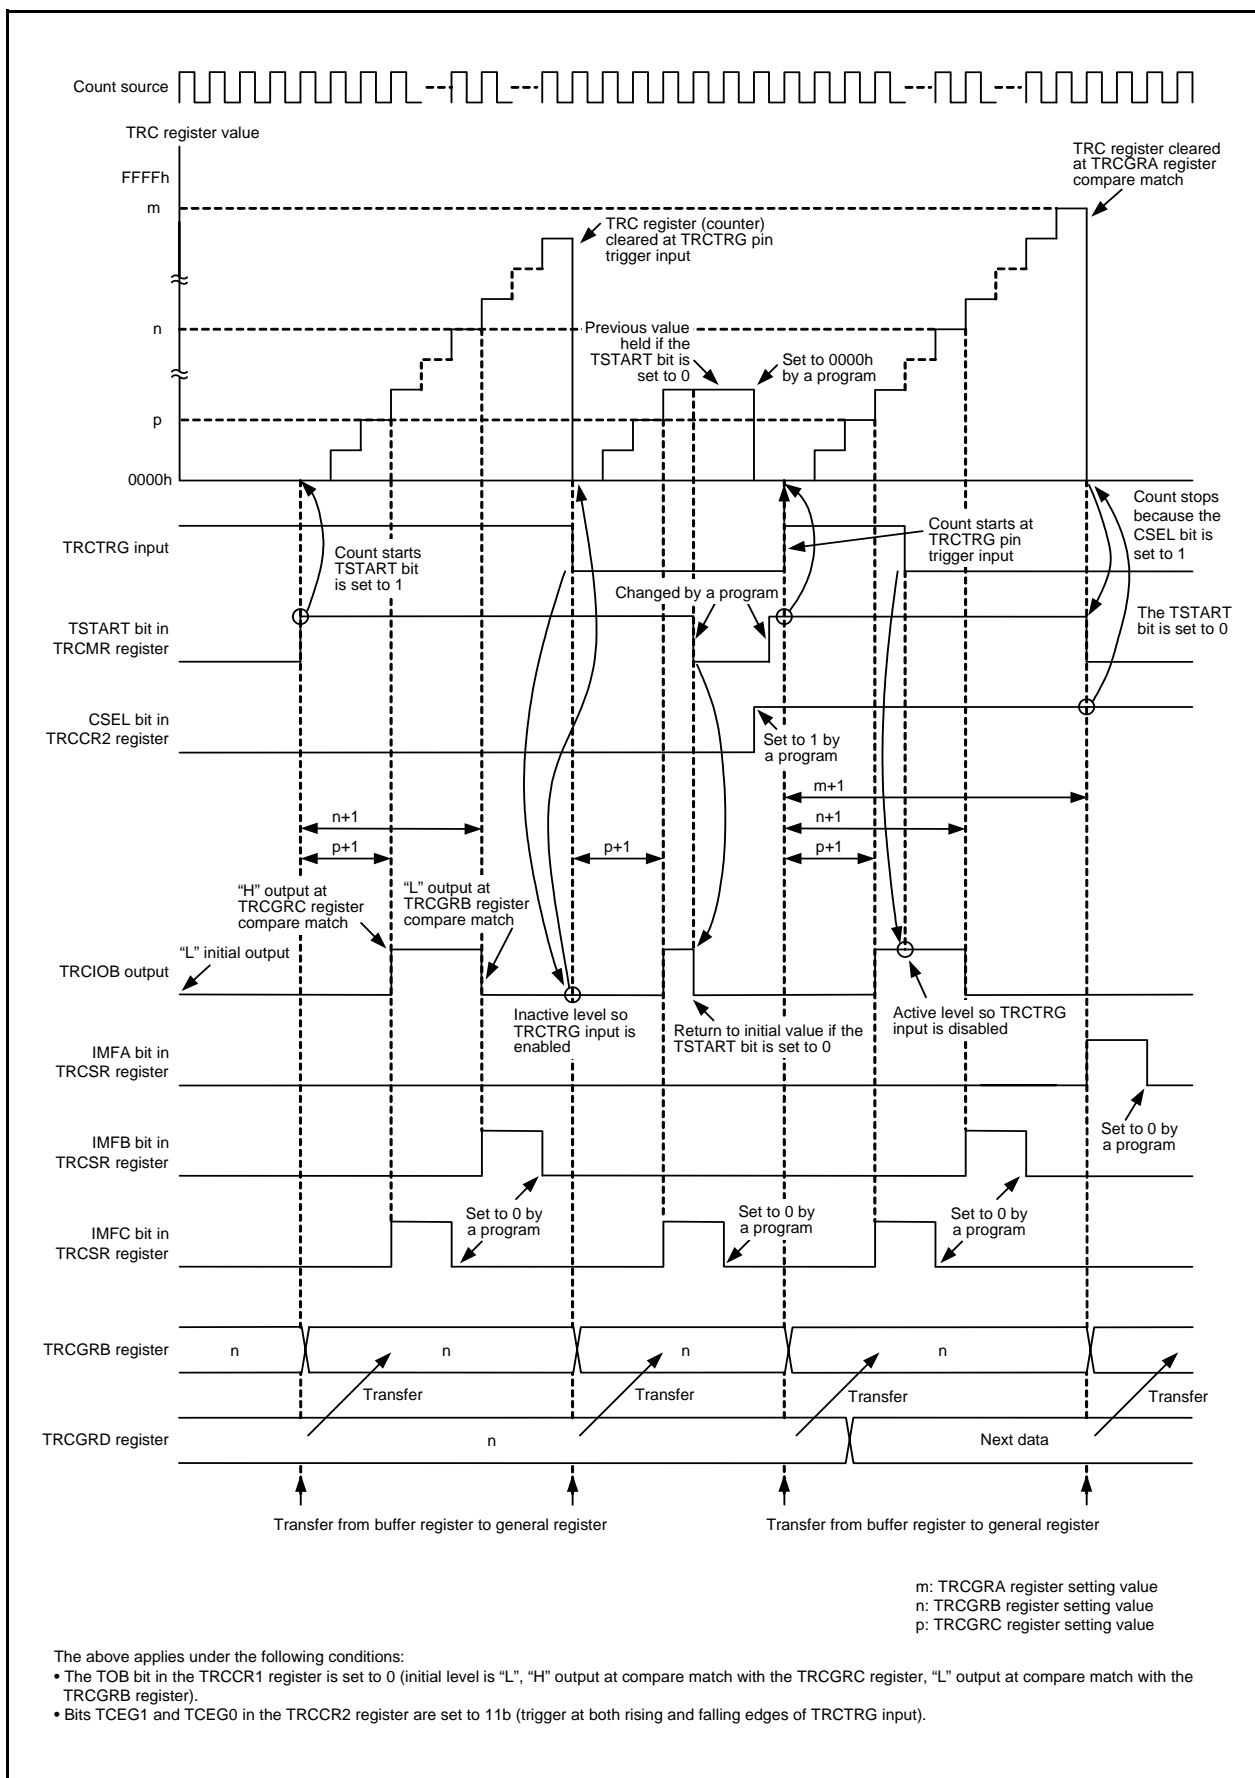

Figure 19.18 Operating Example of PWM2 Mode (TRCTRG Trigger Input Enabled)

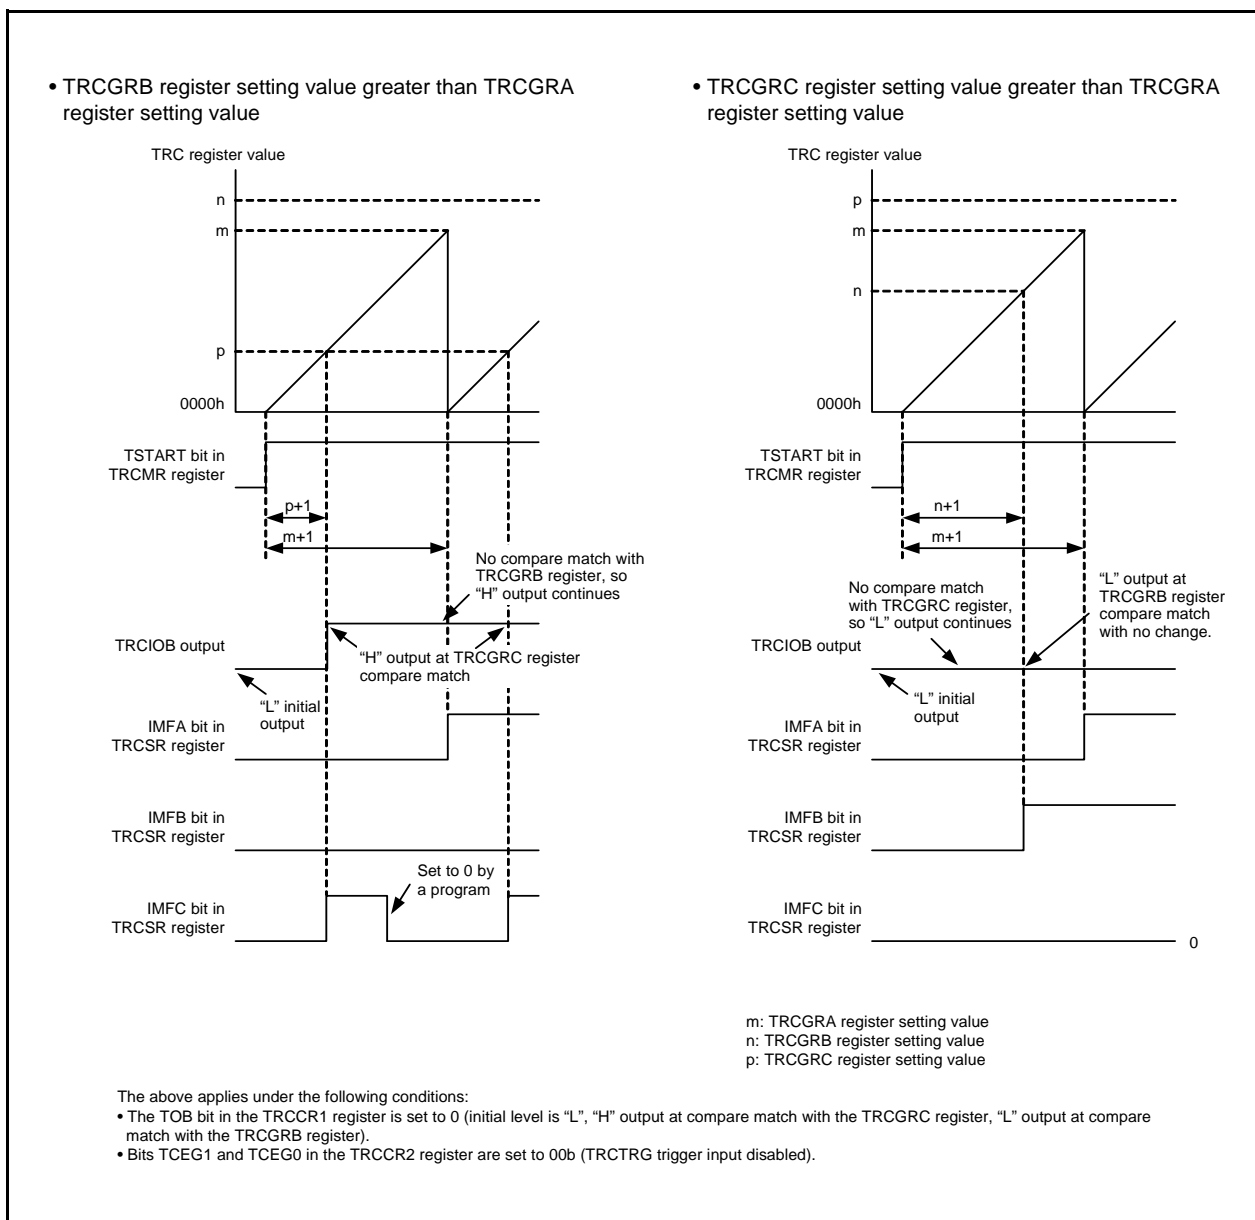

Figure 19.19 Operating Example of PWM2 Mode (Duty 0% and Duty 100%)

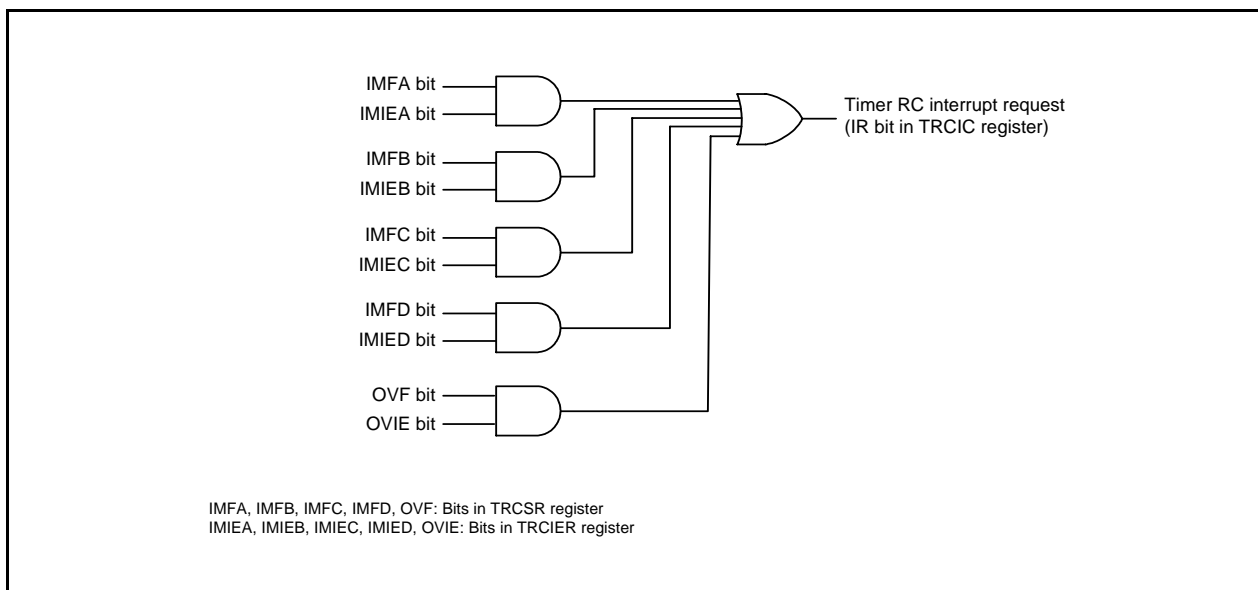

## 19.8 Timer RC Interrupt

Timer RC generates a timer RC interrupt request from five sources. The timer RC interrupt uses the single TRCIC register (bits IR and ILVL0 to ILVL2) and a single vector.

Table 19.15 lists the Registers Associated with Timer RC Interrupt, and Figure 19.20 shows a Timer RC Interrupt Block Diagram.

**Table 19.15 Registers Associated with Timer RC Interrupt**

Timer RC Status Register	Timer RC Interrupt Enable Register	Timer RC Interrupt Control Register
TRCSR	TRCIER	TRCIC

**Figure 19.20 Timer RC Interrupt Block Diagram**

Like other maskable interrupts, the timer RC interrupt is controlled by the combination of the I flag, IR bit, bits ILVL0 to ILVL2, and IPL. However, it differs from other maskable interrupts in the following respects because a single interrupt source (timer RC interrupt) is generated from multiple interrupt request sources.

- The IR bit in the TRCIC register is set to 1 (interrupt requested) when a bit in the TRCSR register is set to 1 and the corresponding bit in the TRCIER register is also set to 1 (interrupt enabled).
- The IR bit is set to 0 (no interrupt requested) when the bit in the TRCSR register or the corresponding bit in the TRCIER register is set to 0, or both are set to 0. In other words, the interrupt request is not maintained if the IR bit is once set to 1 but the interrupt is not acknowledged.
- If another interrupt source is triggered after the IR bit is set to 1, the IR bit remains set to 1 and does not change.
- If multiple bits in the TRCIER register are set to 1, use the TRCSR register to determine the source of the interrupt request.
- The bits in the TRCSR register are not automatically set to 0 when an interrupt is acknowledged. Set them to 0 within the interrupt routine. Refer to **19.2.5 Timer RC Status Register (TRCSR)**, for the procedure for setting these bits to 0.

Refer to **19.2.4 Timer RC Interrupt Enable Register (TRCIER)**, for details of the TRCIER register.

Refer to **11.3 Interrupt Control**, for details of the TRCIC register and **11.1.5.2 Relocatable Vector Tables**, for information on interrupt vectors.

## 19.9 Notes on Timer RC

### 19.9.1 TRC Register

- The following note applies when the CCLR bit in the TRCCR1 register is set to 1 (clear TRC register at compare match with TRCGRA register).

When using a program to write a value to the TRC register while the TSTART bit in the TRCMR register is set to 1 (count starts), ensure that the write does not overlap with the timing with which the TRC register is set to 0000h.

If the timing of the write to the TRC register and the setting of the TRC register to 0000h coincide, the write value will not be written to the TRC register and the TRC register will be set to 0000h.

- Reading from the TRC register immediately after writing to it can result in the value previous to the write being read out. To prevent this, execute the JMP.B instruction between the read and the write instructions.

Program Example	MOV.W	#XXXXh, TRC	; Write
	JMP.B	L1	; JMP.B instruction
L1:	MOV.W	TRC, DATA	; Read

### 19.9.2 TRCSR Register

Reading from the TRCSR register immediately after writing to it can result in the value previous to the write being read out. To prevent this, execute the JMP.B instruction between the read and the write instructions.

Program Example	MOV.B	#XXh, TRCSR	; Write
	JMP.B	L1	; JMP.B instruction
L1:	MOV.B	TRCSR, DATA	; Read

### 19.9.3 TRCCR1 Register

To set bits TCK2 to TCK0 in the TRCCR1 register to 111b (fOCO-F), set fOCO-F to the clock frequency higher than the CPU clock frequency.

### 19.9.4 Count Source Switching

- Stop the count before switching the count source.

Switching procedure

- (1) Set the TSTART bit in the TRCMR register to 0 (count stops).
- (2) Change the settings of bits TCK2 to TCK0 in the TRCCR1 register.

- After switching the count source from fOCO40M to another clock, allow a minimum of two cycles of f1 to elapse after changing the clock setting before stopping fOCO40M.

Switching procedure

- (1) Set the TSTART bit in the TRCMR register to 0 (count stops).
- (2) Change the settings of bits TCK2 to TCK0 in the TRCCR1 register.
- (3) Wait for a minimum of two cycles of f1.
- (4) Set the FRA00 bit in the FRA0 register to 0 (high-speed on-chip oscillator off).

- After switching the count source from fOCO-F to fOCO40M, allow a minimum of two cycles of fOCO-F to elapse after changing the clock setting before stopping fOCO-F.

Switching procedure

- (1) Set the TSTART bit in the TRCMR register to 0 (count stops).
- (2) Change the settings of bits TCK2 to TCK0 in the TRCCR1 register.
- (3) Wait for a minimum of two cycles of fOCO-F.
- (4) Set the FRA00 bit in the FRA0 register to 0 (high-speed on-chip oscillator off).

- After switching the count source from fOCO-F to a clock other than fOCO40M, allow a minimum of one cycle of fOCO-F + fOCO40M to elapse after changing the clock setting before stopping fOCO-F.

Switching procedure

- (1) Set the TSTART bit in the TRCMR register to 0 (count stops).
- (2) Change the settings of bits TCK2 to TCK0 in the TRCCR1 register.
- (3) Wait for a minimum of one cycle of fOCO-F + fOCO40M.
- (4) Set the FRA00 bit in the FRA0 register to 0 (high-speed on-chip oscillator off).

### 19.9.5 Input Capture Function

- Set the pulse width of the input capture signal as follows:  
 [When the digital filter is not used]  
 Three or more cycles of the timer RC operation clock (refer to **Table 19.1 Timer RC Operation Clock**)  
 [When the digital filter is used]  
 Five cycles of the digital filter sampling clock + three cycles of the timer RC operating clock, minimum (refer to **Figure 19.5 Digital Filter Block Diagram**)
- The value of the TRC register is transferred to the TRCGRj register one or two cycles of the timer RC operation clock after the input capture signal is input to the TRCIOj (j = A, B, C, or D) pin (when the digital filter function is not used).

### 19.9.6 TRCMR Register in PWM2 Mode

When the CSEL bit in the TRCCR2 register is set to 1 (count stops at compare match with the TRCGRA register), do not set the TRCMR register at compare match timing of registers TRC and TRCGRA.

### 19.9.7 Count Source fOCO40M

The count source fOCO40M can be used with supply voltage  $V_{CC} = 2.7\text{ V}$  to  $5.5\text{ V}$ . For supply voltage other than that, do not set bits TCK2 to TCK0 in the TRCCR1 register to 110b (select fOCO40M as the count source).

## 20. Serial Interface (UARTi (i = 0 or 1))

The serial interface consists of three channels, UART0 to UART2. This chapter describes the UARTi (i = 0 or 1).

### 20.1 Overview

UART0 and UART 1 have a dedicated timer to generate a transfer clock and operate independently. UART0 and UART1 support clock synchronous serial I/O mode and clock asynchronous serial I/O mode (UART mode).

Figure 20.1 shows a UARTi (i = 0 or 1) Block Diagram. Figure 20.2 shows a Block Diagram of UARTi Transmit/Receive Unit. Table 20.1 lists the Pin Configuration of UARTi (i = 0 or 1).

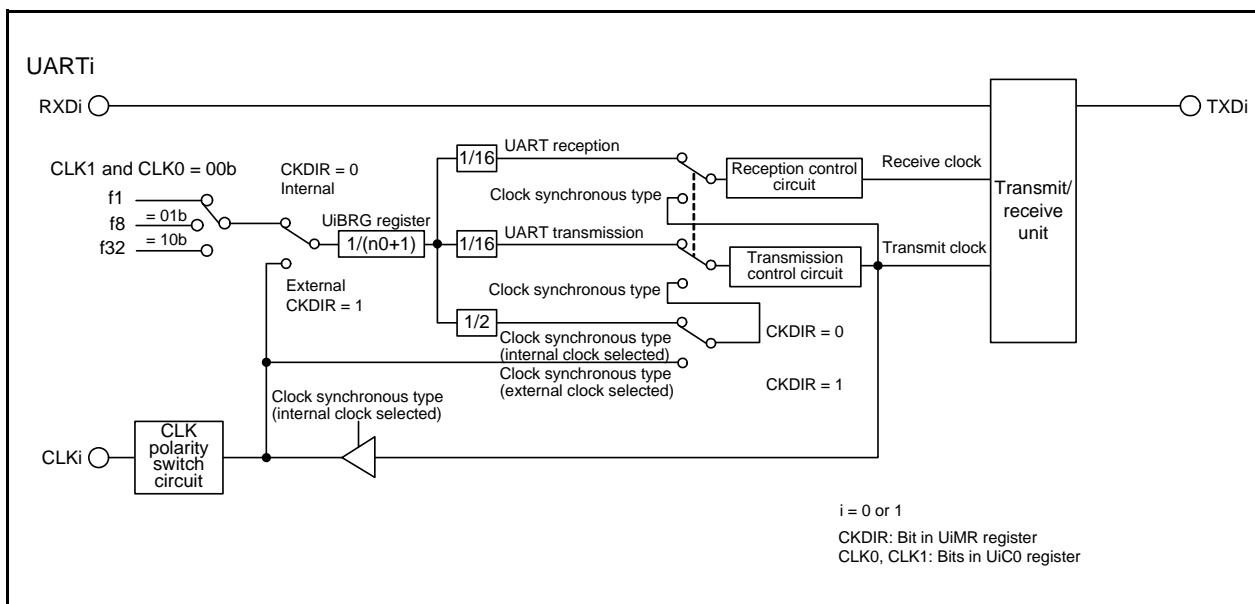

Figure 20.1 UARTi (i = 0 or 1) Block Diagram

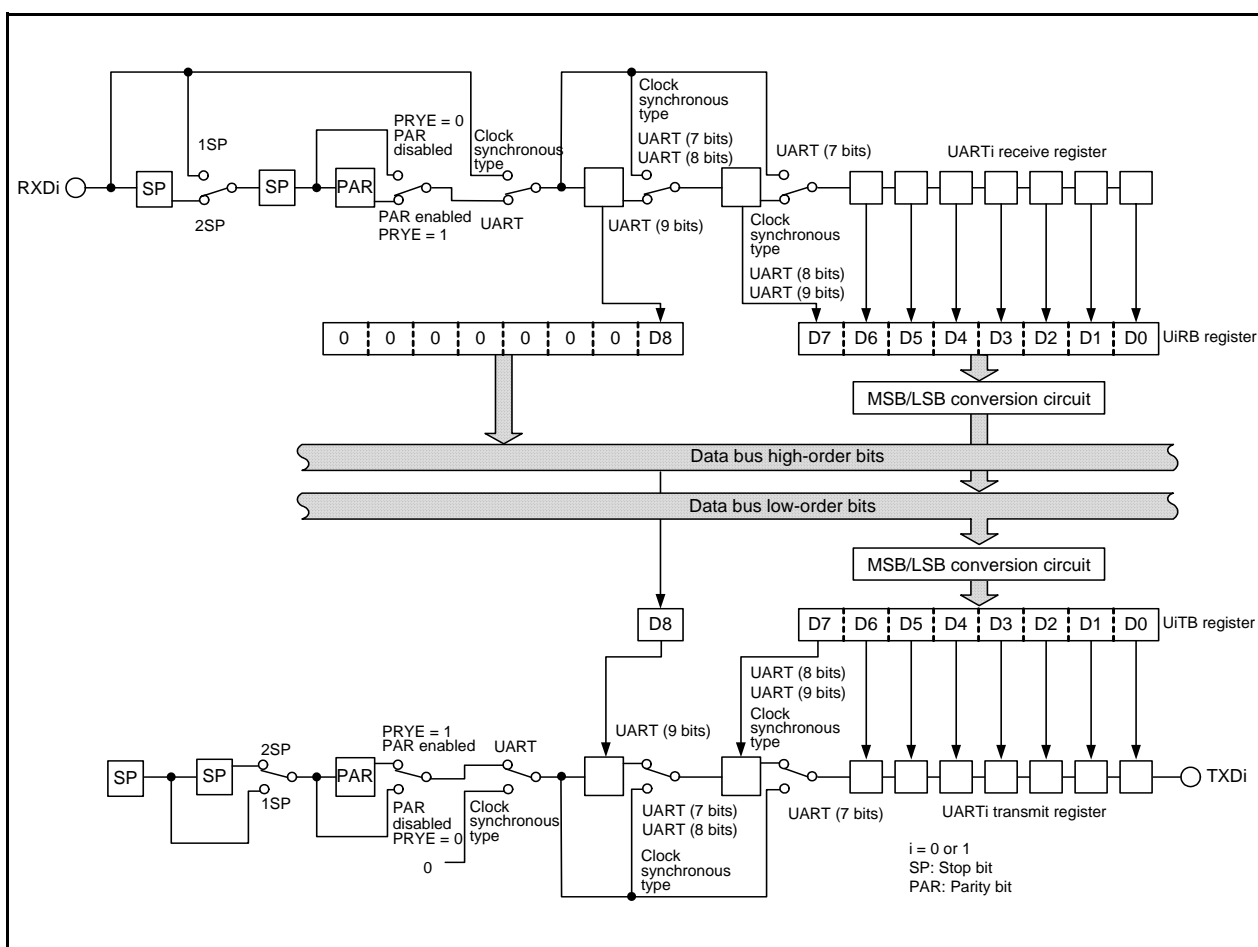

Figure 20.2 Block Diagram of UARTi Transmit/Receive Unit

Table 20.1 Pin Configuration of UARTi (i = 0 or 1)

Pin Name	Assigned Pin	I/O	Function
TXD0	P1_4	Output	Serial data output
RXD0	P1_5	Input	Serial data input
CLK0	P1_6	I/O	Transfer clock I/O
TXD1	P0_1	Output	Serial data output
RXD1	P0_2	Input	Serial data input
CLK1	P0_3	I/O	Transfer clock I/O

## 20.2 Registers

### 20.2.1 UARTi Transmit/Receive Mode Register (UiMR) (i = 0 or 1)

Bit	Function	Setting Range	R/W
b7 to b0	If the setting value is n, UiBRG divides the count source by n+1.	00h to FFh	W

Write to the UiBRG register while transmission and reception stop.

Use the MOV instruction to write to this register.

Set bits CLK0 and CLK1 in the UiC0 register before writing to the UiBRG register.

**20.2.3 UARTi Transmit Buffer Register (UiTB) (i = 0 or 1)**

Address 00A3h to 00A2h (U0TB), 0163h to 0162h (U1TB)

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	—	—	—	—
After Reset	X	X	X	X	X	X	X	X

Bit	b15	b14	b13	b12	b11	b10	b9	b8
Symbol	—	—	—	—	—	—	—	—
After Reset	X	X	X	X	X	X	X	X

Bit	Symbol	Function	R/W

b13	—		
b14	—		
b15	—		

If the transfer data is 9 bits long, write data to the high-order byte first, then low-order byte of the UiTB register.  
Use the MOV instruction to write to this register.

### 20.2.4 UARTi Transmit/Receive Control Register 0 (UiC0) (i = 0 or 1)

Address 00A4h (U0C0), 0164h (U1C0)

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	UFORM	CKPOL	NCH	—	TXEPT	—	CLK1	CLK0
After Reset	0	0	0	0	1	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	CLK0	BRG count source select bit <sup>(1)</sup>	b1 b0 0 0: f1 selected 0 1: f8 selected 1 0: f32 selected 1 1: Do not set.	R/W
b1	CLK1			R/W
b2	—	Reserved bit	Set to 0.	R/W
b3	TXEPT	Transmit register empty flag	0: Data present in the transmit register (transmission in progress) 1: No data in the transmit register (transmission completed)	R
b4	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b5	NCH	Data output select bit	0: TXDi pin set to CMOS output 1: TXDi pin set to N-channel open-drain output	R/W
b6	CKPOL	CLK polarity select bit	0: Transmit data output at the falling edge and receive data input at the rising edge of the transfer clock 1: Transmit data output at the rising edge and receive data input at the falling edge of the transfer clock	R/W
b7	UFORM	Transfer format select bit	0: LSB first 1: MSB first	R/W

Note:

1. If the BRG count source is switched, set the UiBRG register again.

### 20.2.5 UARTi Transmit/Receive Control Register 1 (UiC1) (i = 0 or 1)

Address 00A5h (U0C1), 0165h (U1C1)

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	UiRRM	UiIRS	RI	RE	TI	TE
After Reset	0	0	0	0	0	0	1	0

Bit	Symbol	Bit Name	Function	R/W
b0	TE	Transmit enable bit	0: Transmission disabled 1: Transmission enabled	R/W
b1	TI	Transmit buffer empty flag	0: Data present in the UiTB register 1: No data in the UiTB register	R
b2	RE	Receive enable bit	0: Reception disabled 1: Reception enabled	R/W
b3	RI	Receive complete flag <sup>(1)</sup>	0: No data in the UiRB register 1: Data present in the UiRB register	R
b4	UiIRS	UARTi transmit interrupt source select bit	0: Transmission buffer empty (TI = 1) 1: Transmission completed (TXEPT = 1)	R/W
b5	UiRRM	UARTi continuous receive mode enable bit <sup>(2)</sup>	0: Continuous receive mode disabled 1: Continuous receive mode enabled	R/W
b6	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b7	—			

Notes:

1. The RI bit is set to 0 when the higher byte of the UiRB register is read.
2. In UART mode, set the UiRRM bit to 0 (continuous receive mode disabled).

**20.2.6 UARTi Receive Buffer Register (UiRB) (i = 0 or 1)**

Address 00A7h to 00A6h (U0RB), 0167h to 0166h (U1RB)

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	—	—	—	—
After Reset	X	X	X	X	X	X	X	X

Bit	b15	b14	b13	b12	b11	b10	b9	b8
Symbol	SUM	PER	FER	OER	—	—	—	—
After Reset	X	X	X	X	X	X	X	X

Bit	Symbol	Bit Name	Function	R/W
b0	—	—	Receive data (D7 to D0)	R
b1	—			
b2	—			
b3	—			
b4	—			
b5	—			
b6	—			
b7	—			
b8	—	—	Receive data (D8)	R
b9	—	Nothing is assigned. If necessary, set to 0. When read, the content is undefined.		—
b10	—			
b11	—			
b12	OER			
b12	OER	Overrun error flag <sup>(1)</sup>	0: No overrun error 1: Overrun error	R
b13	FER	Framing error flag <sup>(1, 2)</sup>	0: No framing error 1: Framing error	R
b14	PER	Parity error flag <sup>(1, 2)</sup>	0: No parity error 1: Parity error	R
b15	SUM	Error sum flag <sup>(1, 2)</sup>	0: No error 1: Error	R

## Notes:

- Bits SUM, PER, FER, and OER are set to 0 (no error) when either of the following is set:
  - Bits SMD2 to SMD0 in the UiMR register are set to 000b (serial interface disabled), or
  - The RE bit in the UiC1 register is set to 0 (reception disabled)
 The SUM bit is set to 0 (no error) when all of bits PER, FER, and OER are set to 0 (no error).  
 Bits PER and FER are also set to 0 when the high-order byte of the UiRB register is read.  
 When setting bits SMD2 to SMD0 in the UiMR register to 000b, set the TE bit in the UiC1 register to 0 (transmission disabled) and the RE bit to 0 (reception disabled).
- These error flags are invalid when bits SMD2 to SMD0 in the UiMR register are set to 001b (clock synchronous serial I/O mode). When read, the content is undefined.

Always read the UiRB register in 16-bit units.

### 20.2.7 UART0 Pin Select Register (U0SR)

Address 0188h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	CLK0SEL0	—	RXD0SEL0	—	TXD0SEL0
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	TXD0SEL0	TXD0 pin select bit	0: TXD0 pin not used 1: P1_4 assigned	R/W
b1	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b2	RXD0SEL0	RXD0 pin select bit	0: RXD0 pin not used 1: P1_5 assigned	R/W
b3	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b4	CLK0SEL0	CLK0 pin select bit	0: CLK0 pin not used 1: P1_6 assigned	R/W
b5	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b6	—			
b7	—			

The U0SR register selects which pin is assigned to the UART0 I/O. To use the I/O pin for UART0, set this register.

Set the U0SR register before setting the UART0 associated registers. Also, do not change the setting value in this register during UART0 operation.

### 20.2.8 UART1 Pin Select Register (U1SR)

Address 0189h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	CLK1SEL0	—	RXD1SEL0	—	TXD1SEL0
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	TXD1SEL0	TXD1 pin select bit	0: TXD1 pin not used 1: P0_1 assigned	R/W
b1	—	Reserved bit	Set to 0.	R/W
b2	RXD1SEL0	RXD1 pin select bit	0: RXD1 pin not used 1: P0_2 assigned	R/W
b3	—	Reserved bit	Set to 0.	R/W
b4	CLK1SEL0	CLK1 pin select bit	0: CLK1 pin not used 1: P0_3 assigned	R/W
b5	—	Reserved bit	Set to 0.	R/W
b6	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b7	—			

The U1SR register selects which pin is assigned to the UART1 I/O. To use the I/O pin for UART1, set this register.

Set the U1SR register before setting the UART1 associated registers. Also, do not change the setting value in this register during UART1 operation.

### 20.2.9 Low-Voltage Signal Mode Control Register (TSMR)

Address 0190h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	I3LVM	I2LVM	I1LVM	I0LVM	U2LVM	U1LVM	U0LVM	LVMPR
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	LVMPR	Low-voltage signal mode protect bit	0: Write disabled 1: Write enabled <sup>(1)</sup>	R/W
b1	U0LVM	UART0 low-voltage signal mode control bit <sup>(1)</sup>	0: Low-voltage signal mode disabled 1: Low-voltage signal mode enabled <sup>(2)</sup>	R/W
b2	U1LVM	UART1 low-voltage signal mode control bit <sup>(1)</sup>		R/W
b3	U2LVM	UART2 low-voltage signal mode control bit <sup>(1)</sup>		R/W
b4	I0LVM	$\overline{\text{INT0}}$ low-voltage signal mode control bit <sup>(1)</sup>	0: Low-voltage signal mode disabled 1: Low-voltage signal mode enabled	R/W
b5	I1LVM	$\overline{\text{INT1}}$ low-voltage signal mode control bit <sup>(1)</sup>		R/W
b6	I2LVM	$\overline{\text{INT2}}$ low-voltage signal mode control bit <sup>(1)</sup>		R/W
b7	I3LVM	$\overline{\text{INT3}}$ low-voltage signal mode control bit <sup>(1)</sup>		R/W

Notes:

1. When the LVMPR bit is set to 1 (write enabled), writing to bits UiLVM (i = 0 to 2) and IjLVM (j = 0 to 3) is enabled. Rewrite bits UiLVM (i = 0 to 2) and IjLVM (j = 0 to 3) after setting the LVMPR bit to 1. When writing 1 to the LVMPR bit, write 0 and then 1 continuously.
2. When the UiLVM (i = 0 to 2) bit is set to 1, the TxDi pin is set to N-channel open-drain output regardless of the setting of the NCH bit in the UiC0 (i = 0 to 2) register.

### 20.3 Clock Synchronous Serial I/O Mode

In clock synchronous serial I/O mode, data is transmitted and received using a transfer clock.

Table 20.2 lists the Clock Synchronous Serial I/O Mode Specifications. Table 20.3 lists the Registers Used and Settings in Clock Synchronous Serial I/O Mode.

**Table 20.2 Clock Synchronous Serial I/O Mode Specifications**

Item	Specification
Transfer data format	<ul style="list-style-type: none"> <li>Transfer data length: 8 bits</li> </ul>
Transfer clocks	<ul style="list-style-type: none"> <li>The CKDIR bit in the UiMR register is set to 0 (internal clock): <math>f_i/(2(n+1))</math>  <math>f_i = f_1, f_8, f_{32}</math>  <math>n =</math> setting value in the UiBRG register: 00h to FFh</li> <li>The CKDIR bit is set to 1 (external clock): Input from the CLKi pin</li> </ul>
Transmit start conditions	<p>To start transmission, the following requirements must be met: <sup>(1)</sup></p> <ul style="list-style-type: none"> <li>The TE bit in the UiC1 register is set to 1 (transmission enabled).</li> <li>The TI bit in the UiC1 register is set to 0 (data present in the UiTB register).</li> </ul>
Receive start conditions	<p>To start reception, the following requirements must be met: <sup>(1)</sup></p> <ul style="list-style-type: none"> <li>The RE bit in the UiC1 register is set to 1 (reception enabled).</li> <li>The TE bit in the UiC1 register is set to 1 (transmission enabled).</li> <li>The TI bit in the UiC1 register is set to 0 (data present in the UiTB register).</li> </ul>
Interrupt request generation timing	<p>For transmission: One of the following can be selected.</p> <ul style="list-style-type: none"> <li>The UiIRS bit is set to 0 (transmit buffer empty): When data is transferred from the UiTB register to the UARTi transmit register (at start of transmission).</li> <li>The UiIRS bit is set to 1 (transmission completed): When data transmission from the UARTi transmit register is completed.</li> </ul> <p>For reception:</p> <ul style="list-style-type: none"> <li>When data is transferred from the UARTi receive register to the UiRB register (at completion of reception).</li> </ul>
Error detection	<p>Overrun error <sup>(2)</sup></p> <p>This error occurs if the serial interface starts receiving the next unit of data before reading the UiRB register and receives the 7th bit of the next unit of data.</p>
Selectable functions	<ul style="list-style-type: none"> <li>CLK polarity selection Transfer data input/output can be selected to occur synchronously with the rising or the falling edge of the transfer clock.</li> <li>LSB first, MSB first selection Whether transmitting or receiving data begins with bit 0 or begins with bit 7 can be selected.</li> <li>Continuous receive mode selection Reception is enabled immediately by reading the UiRB register.</li> </ul>

i = 0 or 1

Notes:

- When an external clock is selected, the requirements must be met in either of the following states:
  - The external clock is held high when the CKPOL bit in the UiC0 register is set to 0 (transmit data output at the falling edge and receive data input at the rising edge of the transfer clock)
  - The external clock is held low when the CKPOL bit in the UiC0 register is set to 1 (transmit data output at the rising edge and receive data input at the falling edge of the transfer clock)
- If an overrun error occurs, the receive data (b0 to b8) in the UiRB register will be undefined. The IR bit in the SiRIC register remains unchanged.

**Table 20.3 Registers Used and Settings in Clock Synchronous Serial I/O Mode <sup>(1)</sup>**

Register	Bit	Function
UiTB	b0 to b7	Set data transmission.
UiRB	b0 to b7	Receive data can be read.
	OER	Overrun error flag
UiBRG	b0 to b7	Set a bit rate.
UiMR	SMD2 to SMD0	Set to 001b.
	CKDIR	Select the internal clock or external clock.
UiC0	CLK1, CLK0	Select the count source for the UiBRG register.
	TXEPT	Transmit register empty flag
	NCH	Select TXDi pin output mode.
	CKPOL	Select the transfer clock polarity.
	UFORM	Select LSB first or MSB first.
UiC1	TE	Set to 1 to enable transmission/reception
	TI	Transmit buffer empty flag
	RE	Set to 1 to enable reception.
	RI	Receive complete flag
	UiIRS	Select the UARTi transmit interrupt source.
	UiRRM	Set to 1 to use continuous receive mode.

i = 0 or 1

Note:

1. Set the bits not listed in this table to 0 when writing to the above registers in clock synchronous serial I/O mode.

Table 20.4 lists the I/O Pin Functions in Clock Synchronous Serial I/O Mode.

After UARTi (i = 0 or 1) operating mode is selected, the TXDi pin outputs a “H” level until transfer starts. (If the NCH bit is set to 1 (N-channel open-drain output), this pin is in the high-impedance state.)

**Table 20.4 I/O Pin Functions in Clock Synchronous Serial I/O Mode**

Pin Name	Function	Selection Method
TXD0 (P1_4)	Serial data output	TXD0SEL0 bit in U0SR register = 1 For reception only: P1_4 can be used as a port by setting TXD0SEL0 bit = 0.
RXD0 (P1_5)	Serial data input	RXD0SEL0 bit in U0SR register = 1 PD1_5 bit in PD1 register = 0 For transmission only: P1_5 can be used as a port by setting RXD0SEL0 bit = 0.
CLK0 (P1_6)	Transfer clock output	CLK0SEL0 bit in U0SR register = 1 CKDIR bit in U0MR register = 0
	Transfer clock input	CLK0SEL0 bit in U0SR register = 1 CKDIR bit in U0MR register = 1 PD1_6 bit in PD1 register = 0
TXD1 (P0_1)	Serial data output	TXD1SEL0 bit in U1SR register = 1 For reception only: P0_1 can be used as a port by setting TXD1SEL0 bit = 0.
RXD1 (P0_2)	Serial data input	RXD1SEL0 bit in U1SR register = 1 PD0_2 bit in PD0 register = 0 For transmission only: P0_2 can be used as a port by setting RXD1SEL0 bit = 0.
CLK1 (P0_3)	Transfer clock output	CLK1SEL0 bit in U1SR register = 1 CKDIR bit in U1MR register = 0
	Transfer clock input	CLK1SEL0 bit in U1SR register = 1 CKDIR bit in U1MR register = 1 PD0_3 bit in PD0 register = 0

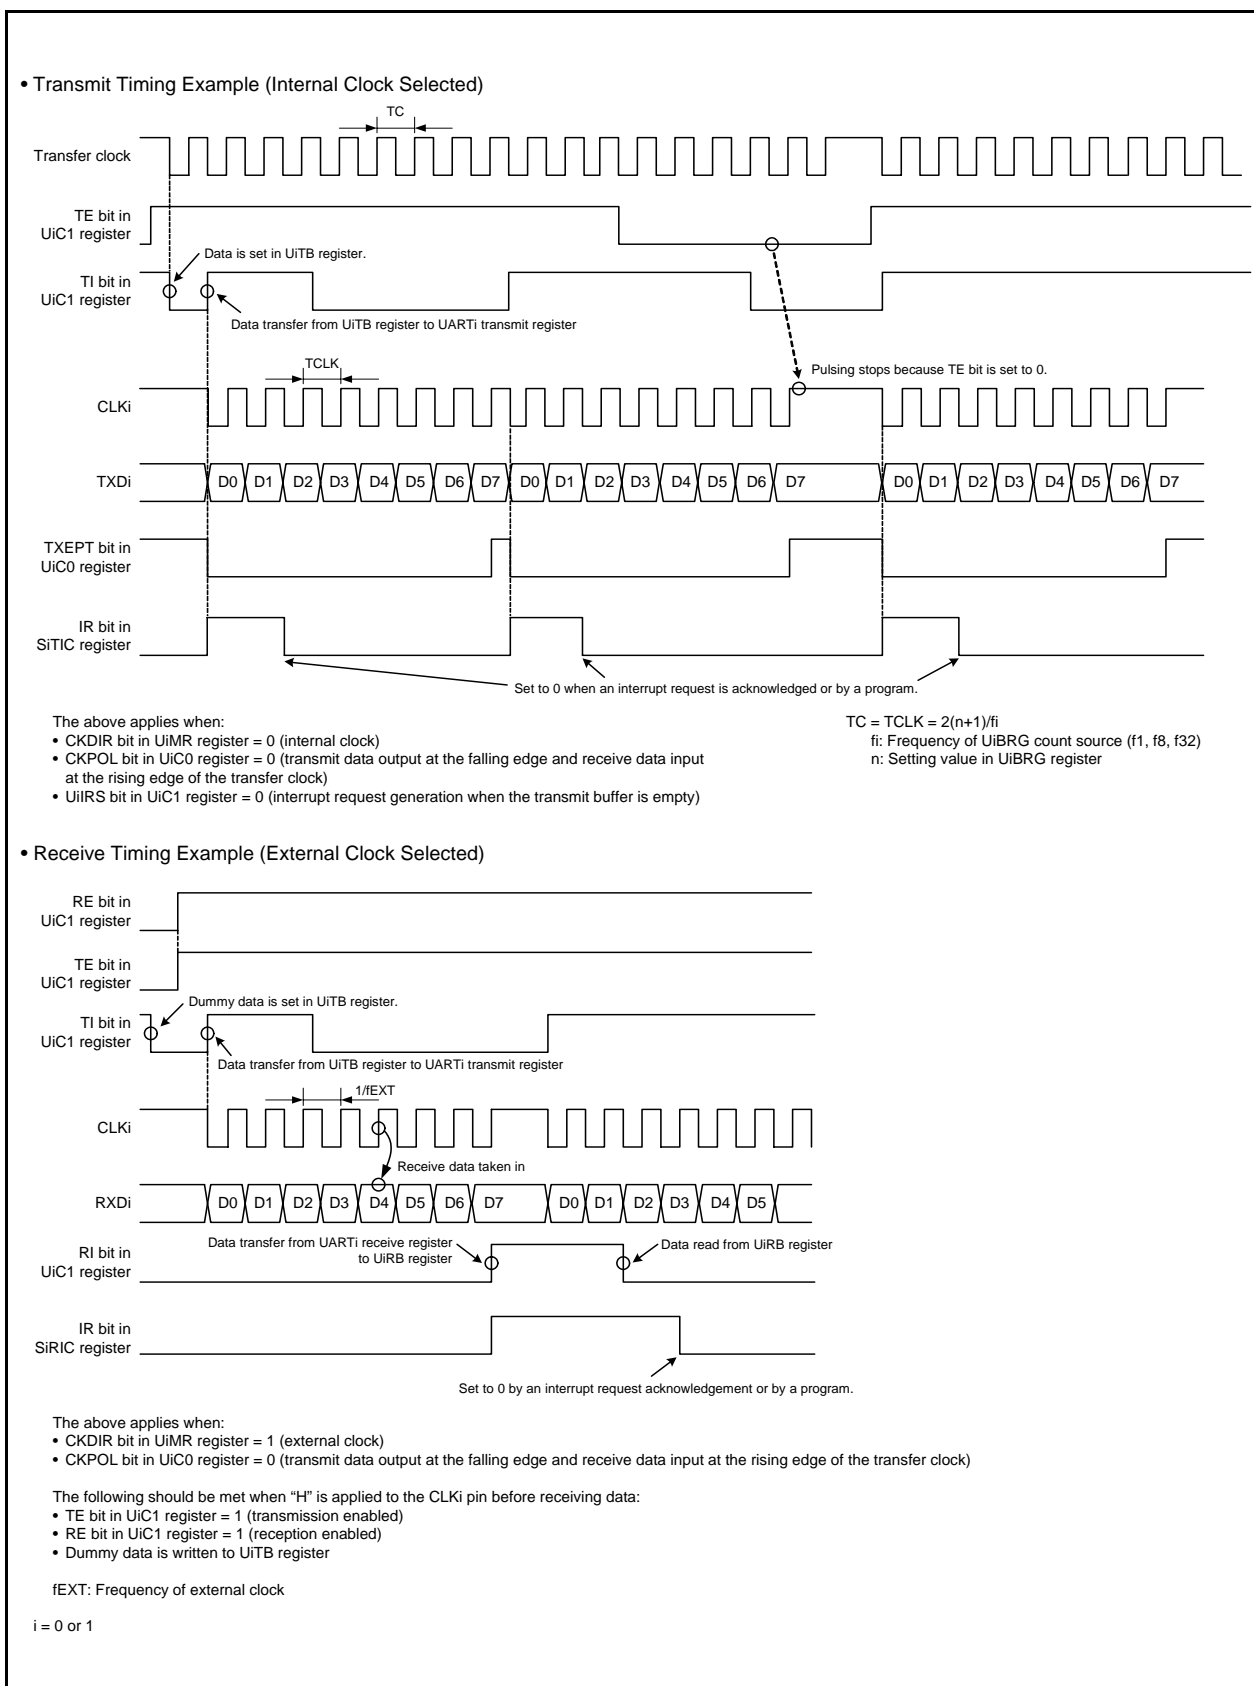

Figure 20.3 Transmit and Receive Timing in Clock Synchronous Serial I/O Mode

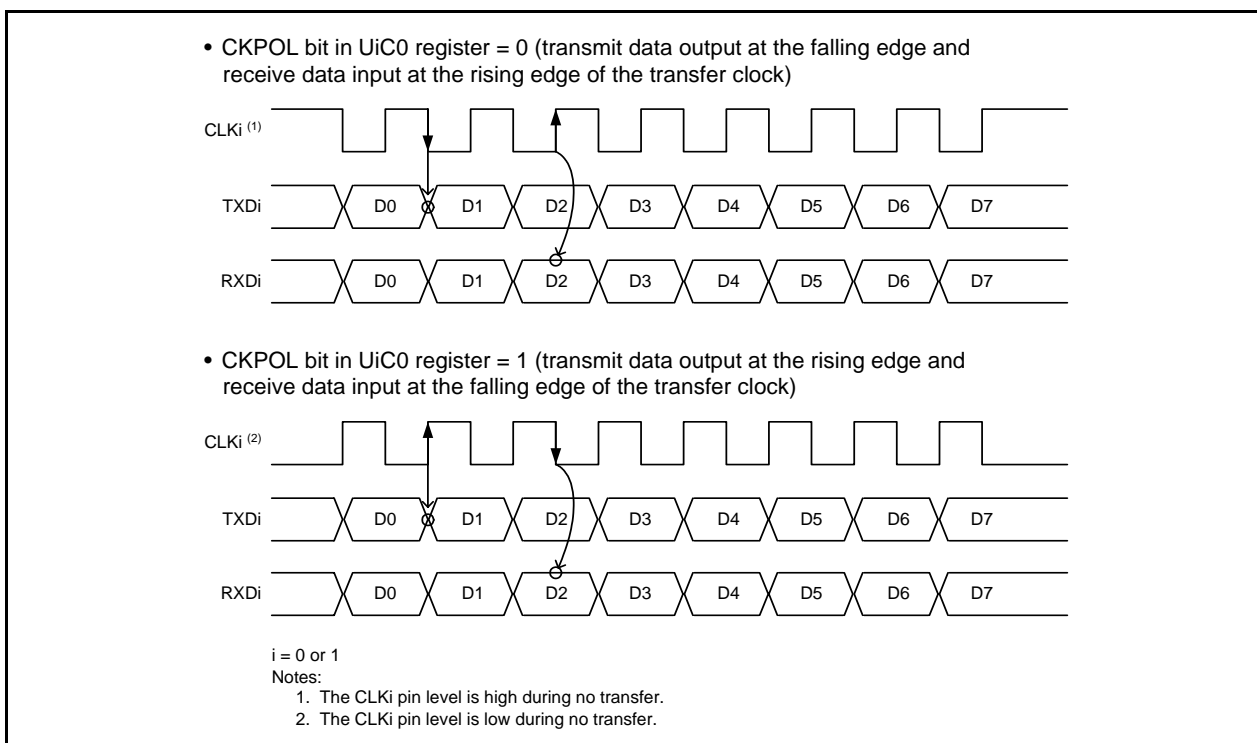

### 20.3.1 Measure for Dealing with Communication Errors

If communication is aborted or a communication error occurs while transmitting or receiving in clock synchronous serial I/O mode, follow the procedures below:

- (1) Set the TE bit in the UiC1 register (i = 0 or 1) to 0 (transmission disabled) and the RE bit to 0 (reception disabled).
- (2) Set bits SMD2 to SMD0 in the UiMR register to 000b (serial interface disabled).
- (3) Set bits SMD2 to SMD0 in the UiMR register to 001b (clock synchronous serial I/O mode).
- (4) Set the TE bit in the UiC1 register to 1 (transmission enabled) and the RE bit to 1 (reception enabled).

### 20.3.2 Polarity Select Function

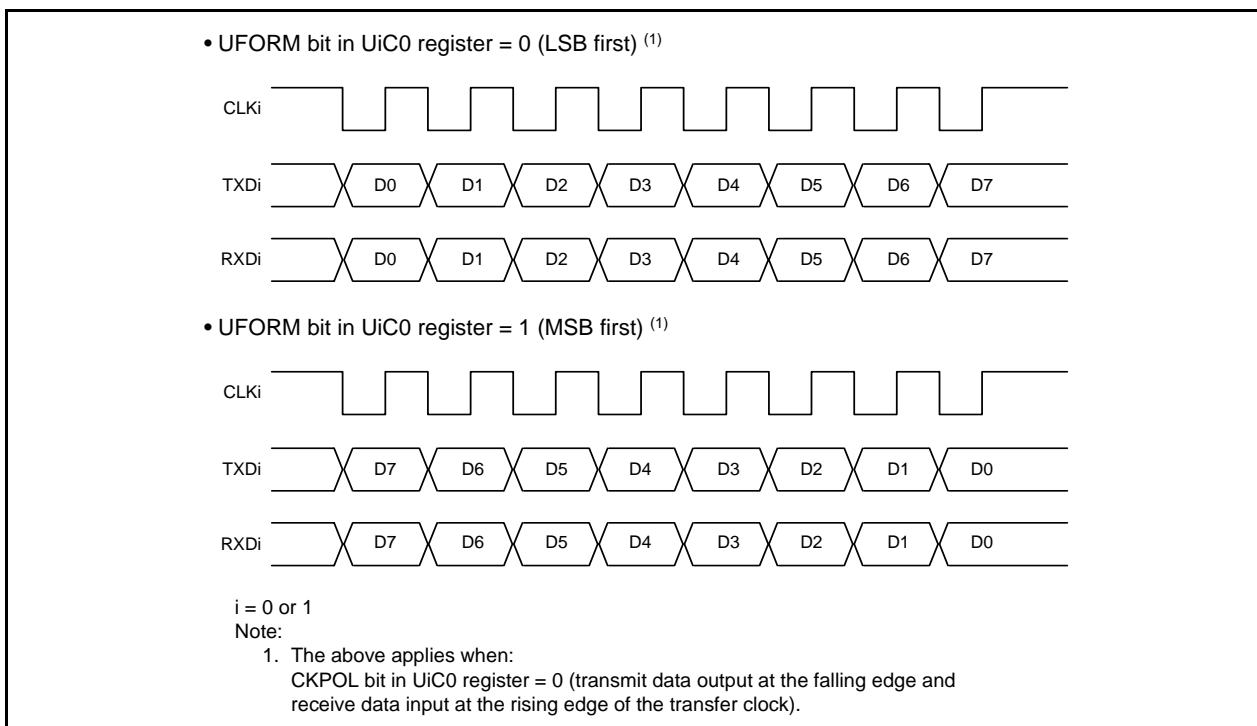

Figure 20.4 shows the Transfer Clock Polarity. Use the CKPOL bit in the UiC0 (i = 0 or 1) register to select the transfer clock polarity.

**Figure 20.4** Transfer Clock Polarity

### 20.3.3 LSB First/MSB First Select Function

Figure 20.5 shows the Transfer Format. Use the UFORM bit in the UiC0 (i = 0 to 1) register to select the transfer format.

**Figure 20.5** Transfer Format

### 20.3.4 Continuous Receive Mode

Continuous receive mode is selected by setting the UiRRM bit in the UiC1 register (i = 0 or 1) to 1 (continuous receive mode enabled). In this mode, reading the UiRB register sets the TI bit in the UiC1 register to 0 (data present in the UiTB register). If the UiRRM bit is set to 1, do not write dummy data to the UiTB register by a program.

## 20.4 Clock Asynchronous Serial I/O (UART) Mode

The UART mode allows data transmission and reception after setting the desired bit rate and transfer data format. Table 20.5 lists the UART Mode Specifications. Table 20.6 lists the Registers Used and Settings in UART Mode.

**Table 20.5 UART Mode Specifications**

Item	Specification
Transfer data formats	<ul style="list-style-type: none"> <li>• Character bits (transfer data): Selectable among 7, 8 or 9 bits</li> <li>• Start bit: 1 bit</li> <li>• Parity bit: Selectable among odd, even, or none</li> <li>• Stop bits: Selectable among 1 or 2 bits</li> </ul>
Transfer clocks	<ul style="list-style-type: none"> <li>• The CKDIR bit in the UiMR register is set to 0 (internal clock): <math>f_j/(16(n+1))</math>  <math>f_j = f_1, f_8, f_{32}</math>  <math>n =</math> setting value in the UiBRG register: 00h to FFh</li> <li>• The CKDIR bit is set to 1 (external clock): <math>f_{EXT}/(16(n+1))</math>  <math>f_{EXT}</math>: Input from the CLKi pin  <math>n =</math> setting value in the UiBRG register: 00h to FFh</li> </ul>
Transmit start conditions	To start transmission, the following requirements must be met: <ul style="list-style-type: none"> <li>• The TE bit in the UiC1 register is set to 1 (transmission enabled).</li> <li>• The TI bit in the UiC1 register is set to 0 (data present in the UiTB register).</li> </ul>
Receive start conditions	To start reception, the following requirements must be met: <ul style="list-style-type: none"> <li>• The RE bit in the UiC1 register is set to 1 (reception enabled).</li> <li>• Start bit detection</li> </ul>
Interrupt request generation timing	For transmission: One of the following can be selected. <ul style="list-style-type: none"> <li>• The UiIRS bit is set to 0 (transmit buffer empty):                When data is transferred from the UiTB register to the UARTi transmit register (at start of transmission).</li> <li>• The UiIRS bit is set to 1 (transfer completed):                When data transmission from the UARTi transmit register is completed.</li> </ul> For reception: <ul style="list-style-type: none"> <li>• When data is transferred from the UARTi receive register to the UiRB register (at completion of reception).</li> </ul>
Error detection	<ul style="list-style-type: none"> <li>• Overrun error <sup>(1)</sup>                This error occurs if the serial interface starts receiving the next unit of data before reading the UiRB register and receive the bit one before the last stop bit of the next unit of data.</li> <li>• Framing error                This error occurs when the set number of stop bits is not detected. <sup>(2)</sup></li> <li>• Parity error                This error occurs when parity is enabled, and the number of 1's in the parity and character bits do not match the set number of 1's. <sup>(2)</sup></li> <li>• Error sum flag                This flag is set to 1 if an overrun, framing, or parity error occurs.</li> </ul>

i = 0 or 1

Notes:

1. If an overrun error occurs, the receive data (b0 to b8) in the UiRB register will be undefined. The IR bit in the SiRIC register remains unchanged.
2. The framing error flag and the parity error flag are set to 1 when data is transferred from the UARTi receive register to the UiRB register.

**Table 20.6 Registers Used and Settings in UART Mode**

Register	Bit	Function
UiTB	b0 to b8	Set transmit data. <sup>(1)</sup>
UiRB	b0 to b8	Receive data can be read. <sup>(2)</sup>
	OER, FER, PER, SUM	Error flag
UiBRG	b0 to b7	Set a bit rate.
UiMR	SMD2 to SMD0	Set to 100b when transfer data is 7 bits long. Set to 101b when transfer data is 8 bits long. Set to 110b when transfer data is 9 bits long.
	CKDIR	Select the internal clock or external clock.
	STPS	Select the stop bit.
	PRY, PRYE	Select whether parity is included and whether odd or even.
UiC0	CLK0, CLK1	Select the count source for the UiBRG register.
	TXEPT	Transmit register empty flag
	NCH	Select TXDi pin output mode.
	CKPOL	Set to 0.
	UFORM	Select LSB first or MSB first when transfer data is 8 bits long. Set to 0 when transfer data is 7 bits or 9 bits long.
UiC1	TE	Set to 1 to enable transmission.
	TI	Transmit buffer empty flag
	RE	Set to 1 to enable reception.
	RI	Receive complete flag
	UiIRS	Select the UARTi transmit interrupt source.
	UiRRM	Set to 0.

i = 0 or 1

Notes:

- The bits used for transmission/receive data are as follows:
  - Bits b0 to b6 when transfer data is 7 bits long
  - Bits b0 to b7 when transfer data is 8 bits long
  - Bits b0 to b8 when transfer data is 9 bits long
- The contents of the following are undefined:
  - Bits 7 and 8 when the transfer data is 7 bits long
  - Bit 8 when the transfer data is 8 bits long

Table 20.7 lists the I/O Pin Functions in UART Mode.

After the UARTi (i = 0 to 1) operating mode is selected, the TXDi pin outputs a “H” level until transfer starts. (If the NCH bit is set to 1 (N-channel open-drain output), this pin is in the high-impedance state.)

**Table 20.7 I/O Pin Functions in UART Mode**

Pin name	Function	Selection Method
TXD0 (P1_4)	Serial data output	TXD0SEL0 bit in U0SR register = 1 For reception only: P1_4 can be used as a port by setting TXD0SEL0 bit = 0.
RXD0 (P1_5)	Serial data input	RXD0SEL0 bit in U0SR register = 1 PD1_5 bit in PD1 register = 0 For transmission only: P1_5 can be used as a port by setting RXD0SEL0 bit = 0.
CLK0 (P1_6)	Programmable I/O port	CLK0SEL0 bit in U0SR register = 0 (CLK0 pin not used)
	Transfer clock input	CLK0SEL0 bit in U0SR register = 1 CKDIR bit in U0MR register = 1 PD1_6 bit in PD1 register = 0
TXD1 (P0_1)	Serial data output	TXD1SEL0 bit in U1SR register = 1 For reception only: P0_1 can be used as a port by setting TXD1SEL0 bit = 0.
RXD1 (P0_2)	Serial data input	RXD1SEL0 bit in U1SR register = 1 PD0_2 bit in PD0 register = 0 For transmission only: P0_2 can be used as a port by setting RXD1SEL0 bit = 0.
CLK1 (P0_3)	Programmable I/O port	CLK1SEL0 bit in U1SR register = 0 (CLK1 pin not used)
	Transfer clock input	CLK1SEL0 bit in U1SR register = 1 CKDIR bit in U1MR register = 1 PD0_3 bit in PD0 register = 0

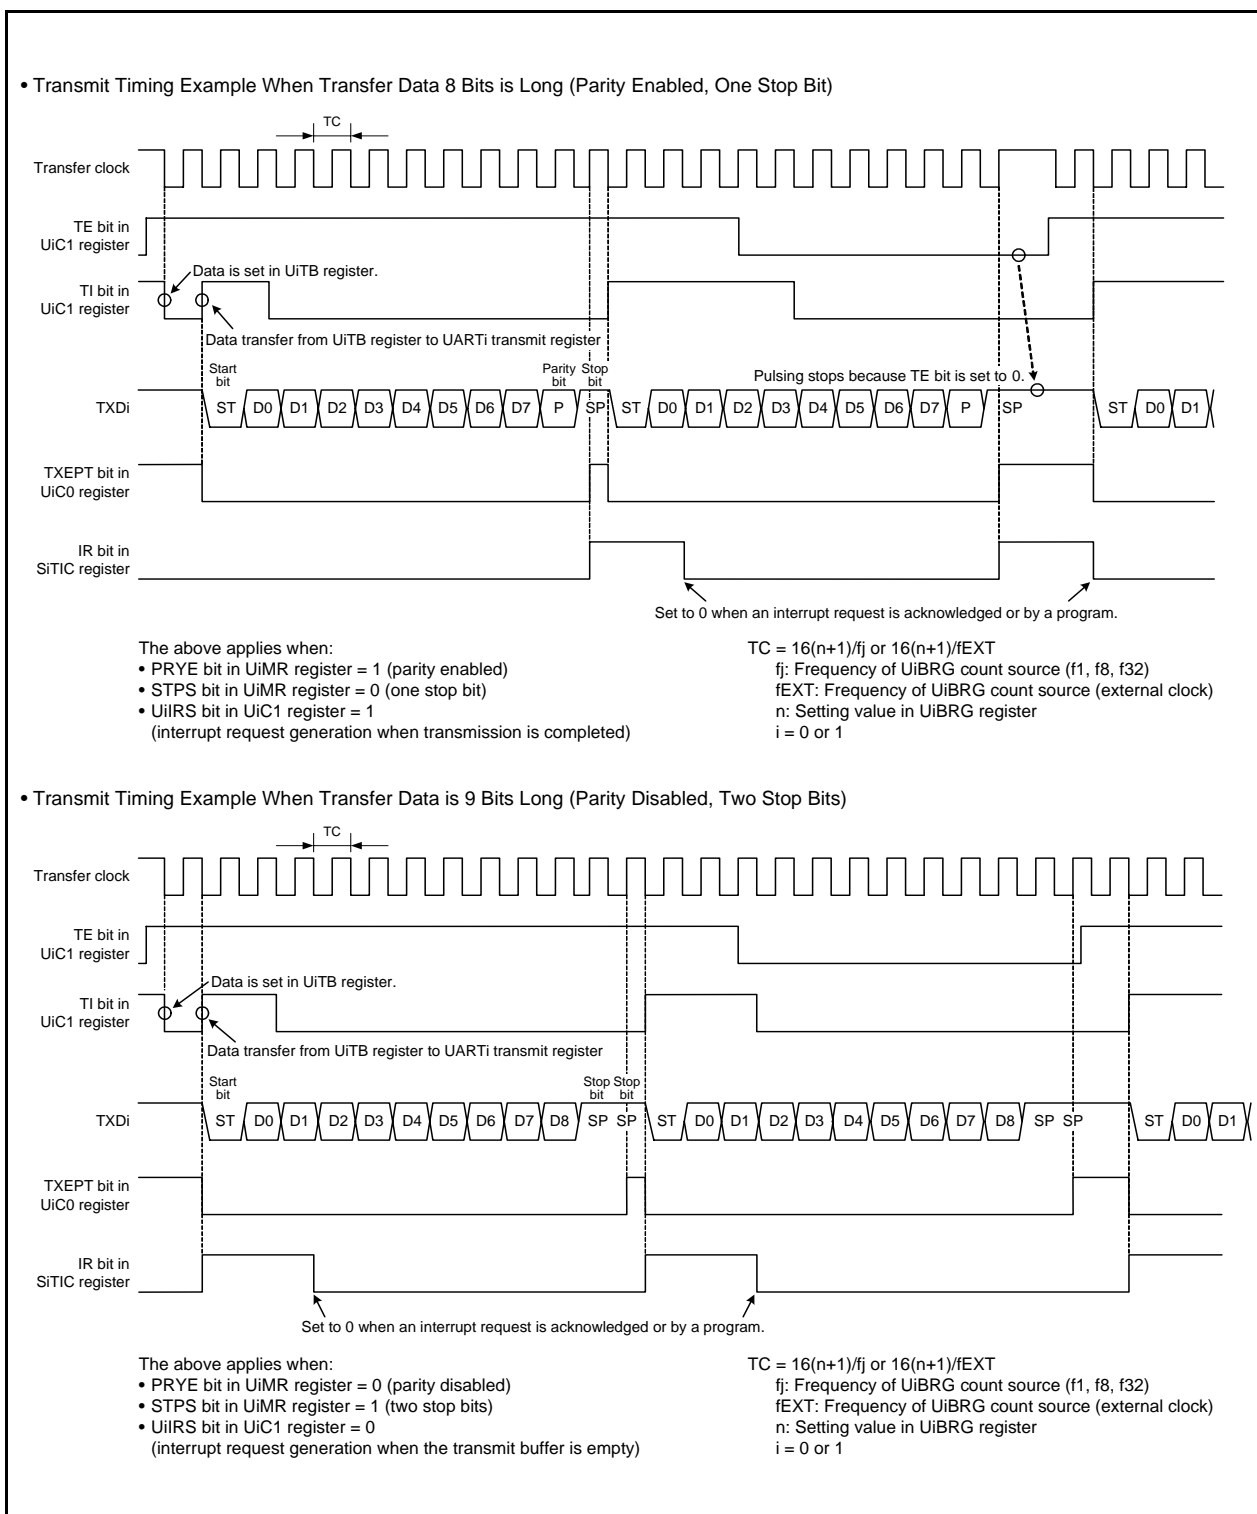

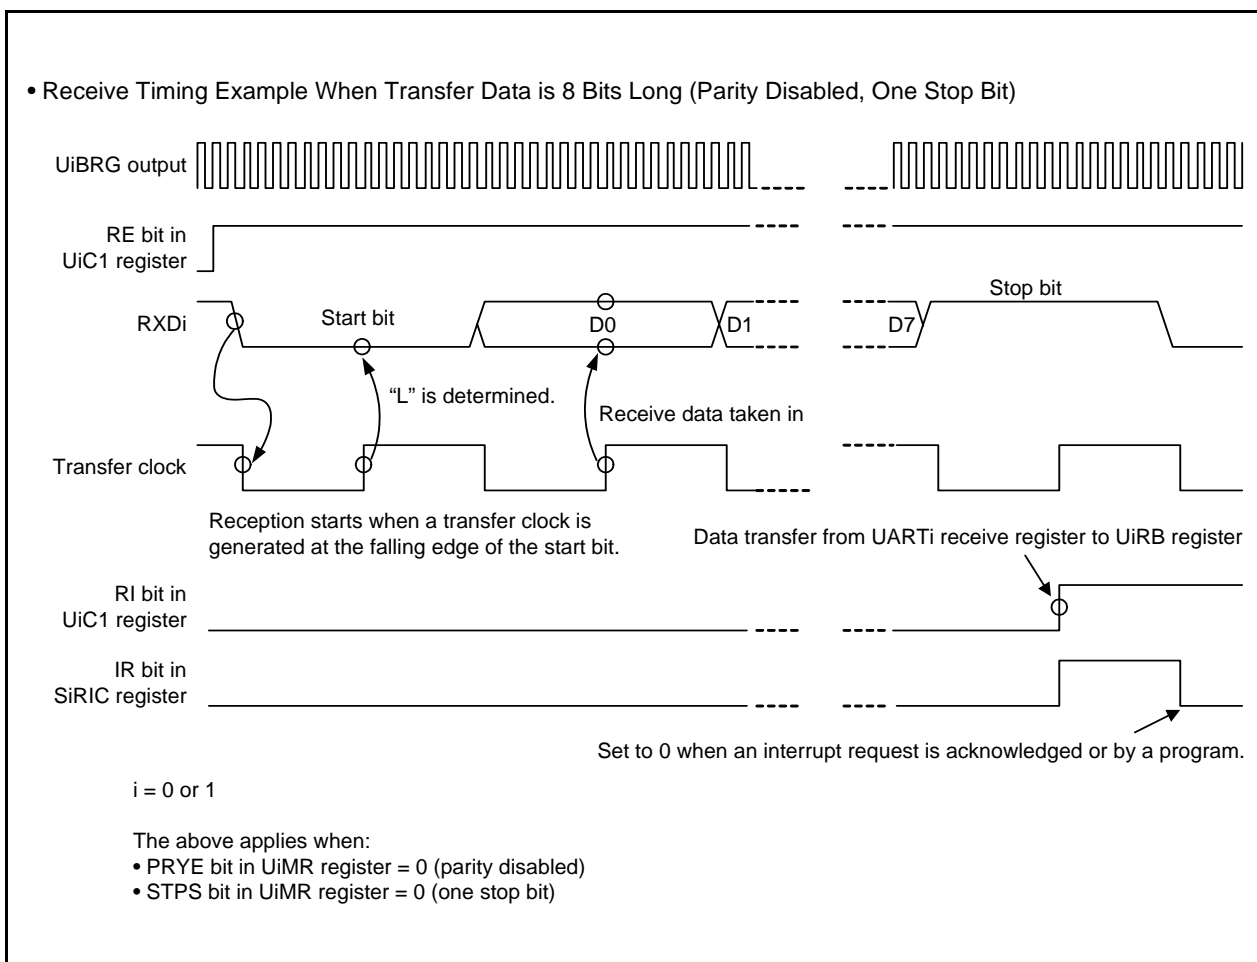

Figure 20.6 Transmit Timing in UART Mode

**Figure 20.7** Receive Timing in UART Mode

### 20.4.1 Bit Rate

In UART mode, the bit rate is the frequency divided by the UiBRG (i = 0 or 1) register and divided by 16.

UART mode

- Internal clock selected

$$\text{Setting value in UiBRG register} = \frac{f_j}{\text{Bit Rate} \times 16} - 1$$

$f_j$ : Count source frequency of UiBRG register ( $f_1$ ,  $f_8$ , or  $f_{32}$ )

- External clock selected

$$\text{Setting value in UiBRG register} = \frac{f_{\text{EXT}}}{\text{Bit Rate} \times 16} - 1$$

$f_{\text{EXT}}$ : Count source frequency of UiBRG register (external clock)

$i = 0$  or  $1$

**Figure 20.8 Formula for Calculating Setting Value in UiBRG (i = 0 or 1) Register**

**Table 20.8 Bit Rate Setting Example in UART Mode (Internal Clock Selected)**

Bit Rate (bps)	UiBRG Count Source	System Clock = 20 MHz			System Clock = 18.432 MHz (1)			System Clock = 8 MHz		
		UiBRG Setting Value	Actual Time (bps)	Setting Error (%)	UiBRG Setting Value	Actual Time (bps)	Setting Error (%)	UiBRG Setting Value	Actual Time (bps)	Setting Error (%)
1200	f8	129 (81h)	1201.92	0.16	119 (77h)	1200.00	0.00	51 (33h)	1201.92	0.16
2400	f8	64 (40h)	2403.85	0.16	59 (3Bh)	2400.00	0.00	25 (19h)	2403.85	0.16
4800	f8	32 (20h)	4734.85	-1.36	29 (1Dh)	4800.00	0.00	12 (0Ch)	4807.69	0.16
9600	f1	129 (81h)	9615.38	0.16	119 (77h)	9600.00	0.00	51 (33h)	9615.38	0.16
14400	f1	86 (56h)	14367.82	-0.22	79 (4Fh)	14400.00	0.00	34 (22h)	14285.71	-0.79
19200	f1	64 (40h)	19230.77	0.16	59 (3Bh)	19200.00	0.00	25 (19h)	19230.77	0.16
28800	f1	42 (2Ah)	29069.77	0.94	39 (27h)	28800.00	0.00	16 (10h)	29411.76	2.12

57600	f1	21 (15h)	56818.18	-1.36	19 (13h)	57600.00	0.00	8 (08h)	55555.56	-3.55
115200	f1	10 (0Ah)	113636.36	-1.36	9 (09h)	115200.00	0.00	—	—	—

$i = 0$  or  $1$

Note:

- For the high-speed on-chip oscillator, the correction value in the FRA4 register should be written into the FRA1 register and the correction value in the FRA5 register should be written into the FRA3 register. This applies when the high-speed on-chip oscillator is selected as the system clock and bits FRA22 to FRA20 in the FRA2 register are set to 000b (divide-by-2 mode). For the precision of the high-speed on-chip oscillator, refer to **27. Electrical Characteristics**.

### 20.4.2 Measure for Dealing with Communication Errors

If communication is aborted or a communication error occurs while transmitting or receiving in UART mode, follow the procedures below:

- (1) Set the TE bit in the UiC1 register (i = 0 or 1) to 0 (transmission disabled) and the RE bit to 0 (reception disabled).
- (2) Set bits SMD2 to SMD0 in the UiMR register to 000b (serial interface disabled).
- (3) Set bits SMD2 to SMD0 in the UiMR register to 100b (UART mode, transfer data 7 bits long), 101b (UART mode, transfer data 8 bits long), or 110b (UART mode, transfer data 9 bits long).
- (4) Set the TE bit in the UiC1 register to 1 (transmission enabled) and the RE bit to 1 (reception enabled).

## 20.5 Low-Voltage Signal Mode

Serial interface (UART0 to UART2) communication and the  $\overline{\text{INT}}$  input for the  $\overline{\text{INT}}$  interrupt can be performed using a low-voltage signal. Table 20.9 lists the Pins Usable for Inputting and Outputting Low-Voltage Signal.

Depending on the setting of the TSMR register, the pins enabled for low-voltage signal mode is switched from schmitt input to CMOS input when they are used as input.

Set the input threshold values for CMOS input using registers VLT0 and VLT1.

When low-voltage signal mode is used, all inputs are set to CMOS input. Since schmitt input is disabled, always take countermeasures against noise.

**Table 20.9 Pins Usable for Inputting and Outputting Low-Voltage Signal**

Peripheral Function Name		Pin
Serial interface	UART0 Clock synchronous serial I/O Clock asynchronous serial I/O	CLK0, RXD0, TXD0
	UART1 Clock synchronous serial I/O Clock asynchronous serial I/O	CLK1, RXD1, TXD1
	UART2 Clock synchronous serial I/O Clock asynchronous serial I/O Special mode 1 (I <sup>2</sup> C mode) Special mode 2 (SSU mode) Multiprocessor communication function	CLK2, RXD2, TXD2, CTS2, RTS2, SCL2, SDA2
$\overline{\text{INT}}$	$\overline{\text{INT0}}$ to $\overline{\text{INT3}}$	$\overline{\text{INT0}}$ to $\overline{\text{INT3}}$

## 20.6 Notes on Serial Interface (UARTi (i = 0 or 1))

- When reading data from the UiRB (i = 0 or 1) register either in clock synchronous serial I/O mode or in clock asynchronous serial I/O mode, always read data in 16-bit units.

When the high-order byte of the UiRB register is read, bits PER and FER in the UiRB register and the RI bit in the UiC1 register are set to 0.

To check receive errors, read the UiRB register and then use the read data.

Program example to read the receive buffer register:

```
MOV.W    00A6H, R0    ; Read the U0RB register
```

- When writing data to the UiTB register in clock asynchronous serial I/O mode with 9-bit transfer data length, write data to the high-order byte first and then the low-order byte, in 8-bit units.

Program example to write to the transmit buffer register:

```
MOV.B    #XXH, 00A3H  ; Write to the high-order byte of the U0TB register
```

```
MOV.B    #XXH, 00A2H  ; Write to the low-order byte of the U0TB register
```

## 21. Serial Interface (UART2)

The serial interface consists of three channels, UART0 to UART2. This chapter describes the UART2.

### 21.1 Overview

UART2 has a dedicated timer to generate a transfer clock.

Figure 21.1 shows a UART2 Block Diagram. Figure 21.2 shows a Block Diagram of UART2 Transmit/Receive Unit. Table 21.1 lists the Pin Configuration of UART2.

UART2 has the following modes:

- Clock synchronous serial I/O mode
- Clock asynchronous serial I/O mode (UART mode)
- Special mode 1 (I<sup>2</sup>C mode)
- Special mode 2 (SSU mode)
- Multiprocessor communication function

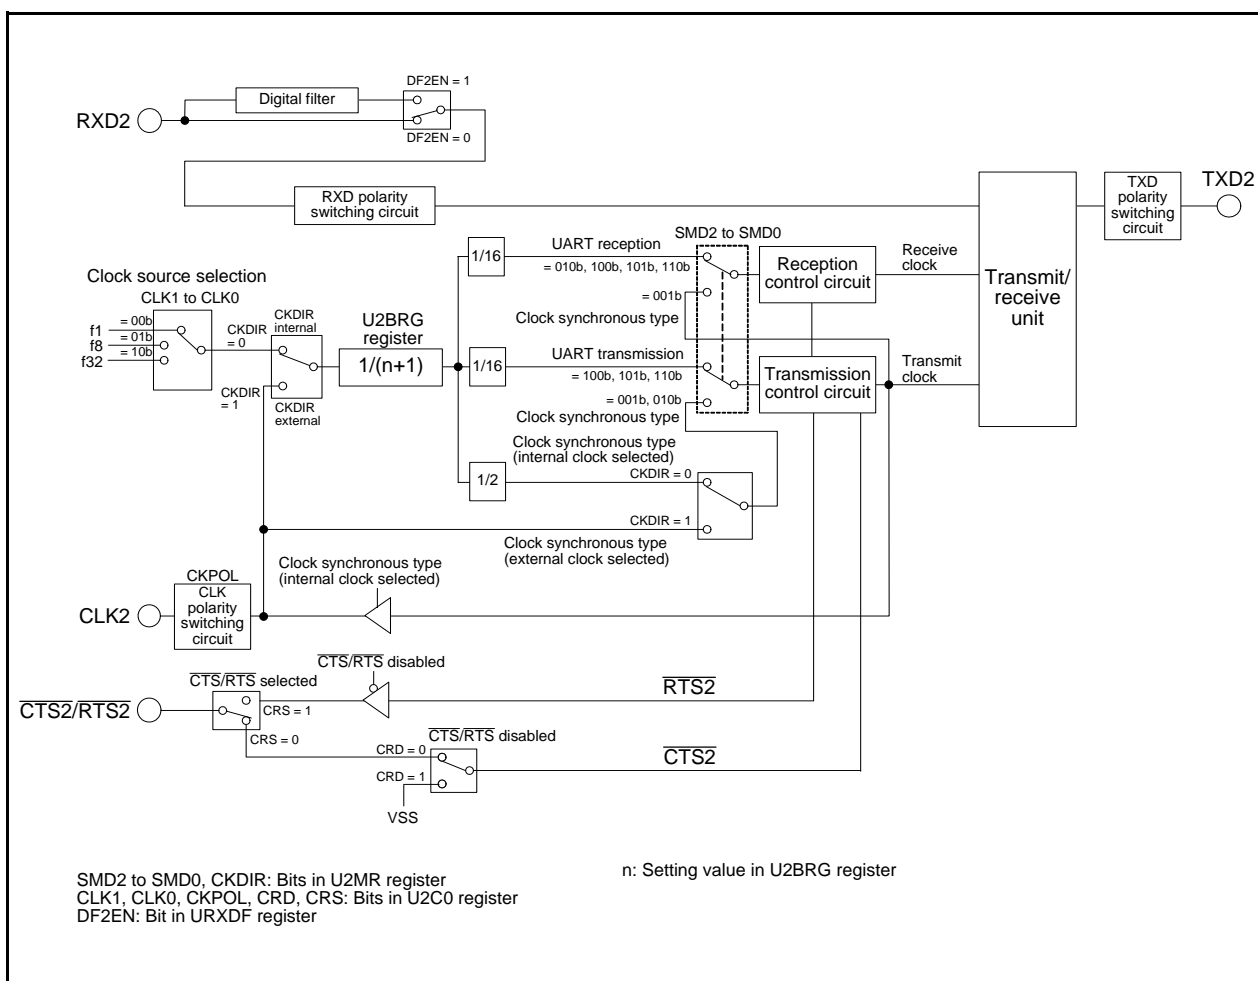

Figure 21.1 UART2 Block Diagram

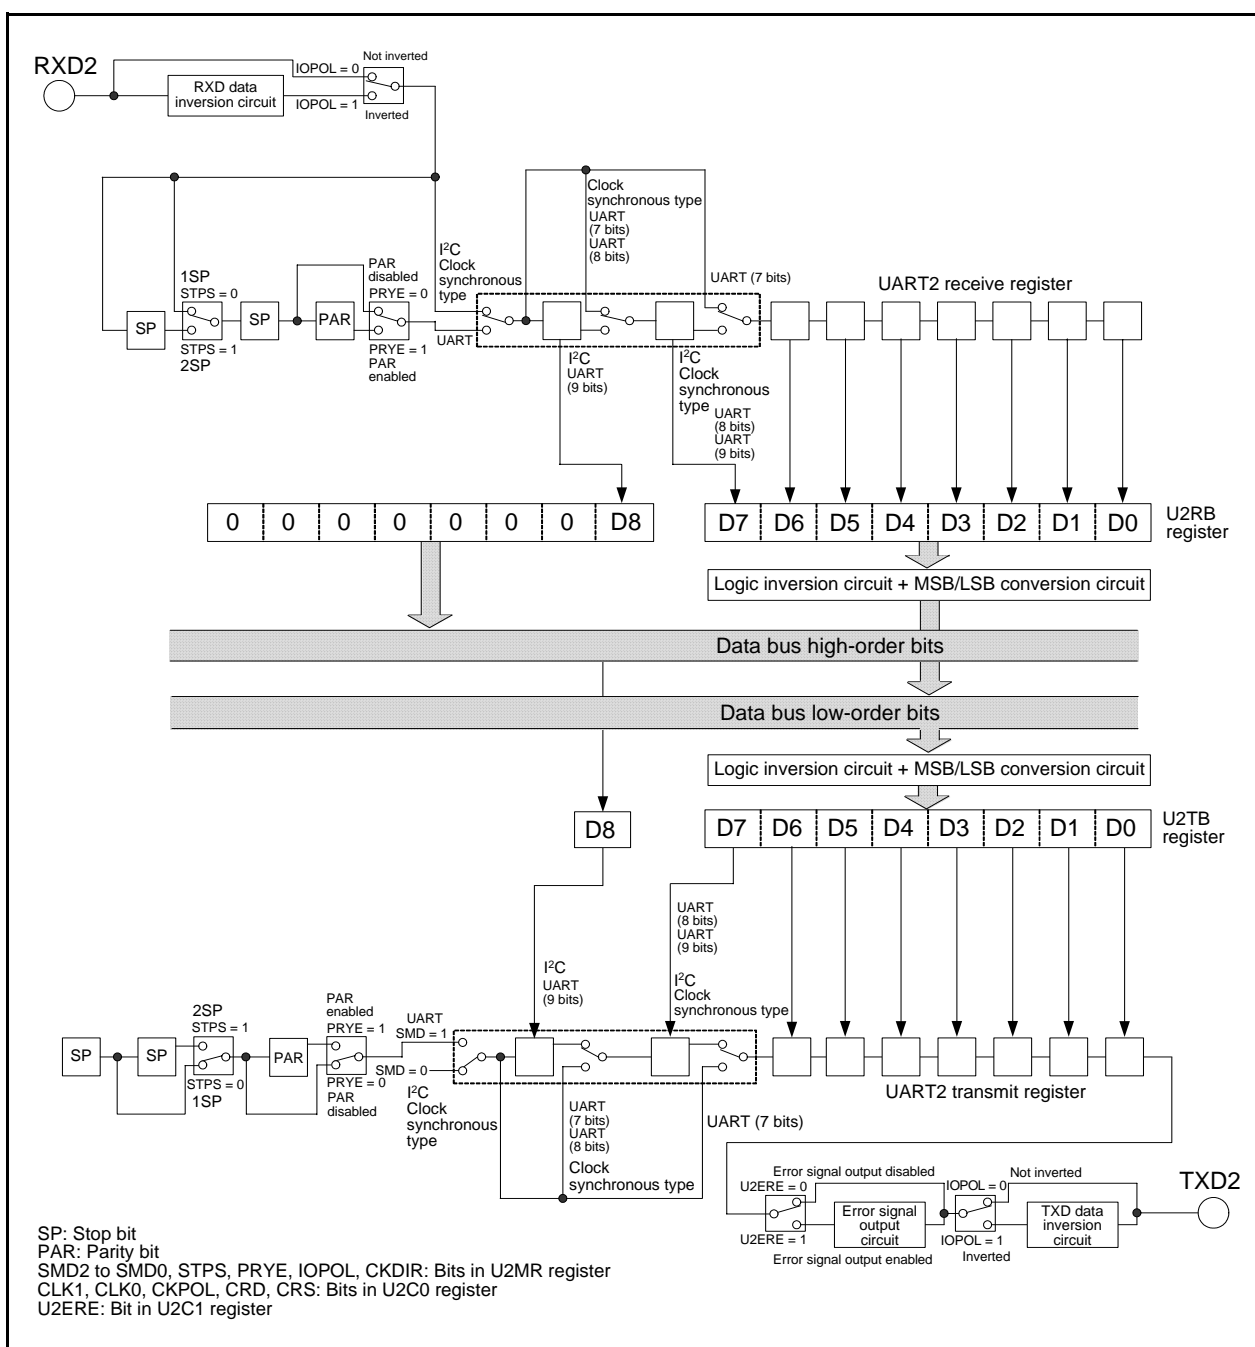

Figure 21.2 Block Diagram of UART2 Transmit/Receive Unit

Table 21.1 Pin Configuration of UART2

Pin Name	Assigned Pin	I/O	Function
TXD2	P0_0, P2_0, P2_2, P3_4, or P3_7	Output	Serial data output
RXD2	P2_0, P2_2, P3_4, P3_7, or P4_5	Input	Serial data input
CLK2	P0_5, P2_1, or P3_5	I/O	Transfer clock I/O
CTS2	P3_1 or P3_3	Input	Transmit control input
RTS2	P3_1 or P3_3	Output	Receive control input
SCL2	P2_0, P2_2, P3_4, P3_7, or P4_5	I/O	I <sup>2</sup> C mode clock I/O
SDA2	P0_0, P2_0, P2_2, P3_4, or P3_7	I/O	I <sup>2</sup> C mode data I/O

## 21.2 Registers

### 21.2.1 UART2 Transmit/Receive Mode Register (U2MR)

Address 00A8h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	IOPOL	PRYE	PRY	STPS	CKDIR	SMD2	SMD1	SMD0
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	SMD0	Serial I/O mode select bit	b2 b1 b0 0 0 0: Serial interface disabled 0 0 1: Clock synchronous serial I/O mode 0 1 0: I <sup>2</sup> C mode 1 0 0: UART mode, transfer data 7 bits long 1 0 1: UART mode, transfer data 8 bits long 1 1 0: UART mode, transfer data 9 bits long Other than above: Do not set.	R/W
b1	SMD1			R/W
b2	SMD2			R/W
b3	CKDIR	Internal/external clock select bit	0: Internal clock 1: External clock	R/W
b4	STPS	Stop bit length select bit	0: One stop bit 1: Two stop bits	R/W
b5	PRY	Odd/even parity select bit	Enabled when PRYE = 1 0: Odd parity 1: Even parity	R/W
b6	PRYE	Parity enable bit	0: Parity disabled 1: Parity enabled	R/W
b7	IOPOL	TXD, RXD I/O polarity switch bit	0: Not inverted 1: Inverted	R/W

### 21.2.2 UART2 Bit Rate Register (U2BRG)

Address 00A9h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	—	—	—	—
After Reset	X	X	X	X	X	X	X	X

Bit	Function	Setting Range	R/W
b7 to b0	If the setting value is n, U2BRG divides the count source by n+1.	00h to FFh	W

Write to the U2BRG register while transmission and reception stop.

Use the MOV instruction to write to this register.

Set bits CLK1 to CLK0 in the U2C0 register before writing to the U2BRG register.

### 21.2.3 UART2 Transmit Buffer Register (U2TB)

Address 00ABh to 00AAh

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	—	—	—	—
After Reset	X	X	X	X	X	X	X	X

Bit	b15	b14	b13	b12	b11	b10	b9	b8
Symbol	—	—	—	—	—	—	—	MPTB
After Reset	X	X	X	X	X	X	X	X

Bit	Symbol	Function	R/W
b0	—	Transmit data (D7 to D0)	W
b1	—		
b2	—		
b3	—		
b4	—		
b5	—		
b6	—		
b7	—		
b8	MPTB	Transmit data (D8) <sup>(1)</sup> [When the multiprocessor communication function is not used] Transmit data (D8) [When the multiprocessor communication function is used] • To transfer an ID, set the MPTB bit to 1. • To transfer data, set the MPTB bit to 0.	W
b9	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.	—
b10	—		
b11	—		
b12	—		
b13	—		
b14	—		
b15	—		

Note:

1. Set bits b0 to b7 after setting the MPTB bit.

### 21.2.4 UART2 Transmit/Receive Control Register 0 (U2C0)

Address 00ACh

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	UFORM	CKPOL	NCH	CRD	TXEPT	CRS	CLK1	CLK0
After Reset	0	0	0	0	1	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	CLK0	U2BRG count source select bit <sup>(1)</sup>	b1 b0 0 0: f1 selected 0 1: f8 selected 1 0: f32 selected 1 1: Do not set.	R/W
b1	CLK1			R/W
b2	CRS	$\overline{\text{CTS}}/\overline{\text{RTS}}$ function select bit	Enabled when CRD = 0 0: $\overline{\text{CTS}}$ function selected 1: $\overline{\text{RTS}}$ function selected	R/W
b3	TXEPT	Transmit register empty flag	0: Data present in the transmit register (transmission in progress) 1: No data in the transmit register (transmission completed)	R
b4	CRD	$\overline{\text{CTS}}/\overline{\text{RTS}}$ disable bit	0: $\overline{\text{CTS}}/\overline{\text{RTS}}$ function enabled 1: $\overline{\text{CTS}}/\overline{\text{RTS}}$ function disabled	R/W
b5	NCH	Data output select bit	0: Pins TXD2/SDA2, SCL2 set to CMOS output 1: Pins TXD2/SDA2, SCL2 set to N-channel open-drain output	R/W
b6	CKPOL	CLK polarity select bit	0: Transmit data output at the falling edge and receive data input at the rising edge of the transfer clock 1: Transmit data output at the rising edge and receive data input at the falling edge of the transfer clock	R/W
b7	UFORM	Transfer format select bit <sup>(2)</sup>	0: LSB first 1: MSB first	R/W

Notes:

1. If bits CLK1 to CLK0 are switched, set the U2BRG register again.
2. The UFORM bit is enabled when bits SMD2 to SMD0 in the U2MR register are set to 001b (clock synchronous serial I/O mode), or set to 101b (UART mode, transfer data 8 bits long).

Set the UFORM bit to 1 when bits SMD2 to SMD0 are set to 010b (I<sup>2</sup>C mode), and to 0 when bits SMD2 to SMD0 are set to 100b (UART mode, transfer data 7 bits long) or 110b (UART mode, transfer data 9 bits long).

### 21.2.5 UART2 Transmit/Receive Control Register 1 (U2C1)

Address 00ADh

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	U2ERE	U2LCH	U2RRM	U2IRS	RI	RE	TI	TE
After Reset	0	0	0	0	0	0	1	0

Bit	Symbol	Bit Name	Function	R/W
b0	TE	Transmit enable bit	0: Transmission disabled 1: Transmission enabled	R/W
b1	TI	Transmit buffer empty flag	0: Data present in the U2TB register 1: No data in the U2TB register	R
b2	RE	Receive enable bit	0: Reception disabled 1: Reception enabled	R/W
b3	RI	Receive complete flag	0: No data in the U2RB register 1: Data present in the U2RB register	R
b4	U2IRS	UART2 transmit interrupt source select bit	0: Transmit buffer empty (TI = 1) 1: Transmission completed (TXEPT = 1)	R/W
b5	U2RRM	UART2 continuous receive mode enable bit	0: Continuous receive mode disabled 1: Continuous receive mode enabled	R/W
b6	U2LCH	Data logic select bit <sup>(1)</sup>	0: Not inverted 1: Inverted	R/W
b7	U2ERE	Error signal output enable bit	0: Output disabled 1: Output enabled	R/W

Note:

1. The U2LCH bit is enabled when bits SMD2 to SMD0 in the U2MR register are set to 001b (clock synchronous serial I/O mode), 100b (UART mode, transfer data 7 bits long), or 101b (UART mode, transfer data 8 bits long). Set the U2LCH bit to 0 when bits SMD2 to SMD0 are set to 010b (I<sup>2</sup>C mode) or 110b (UART mode, transfer data 9 bits long).

### 21.2.6 UART2 Receive Buffer Register (U2RB)

Address 00AFh to 00AEh

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	—	—	—	—
After Reset	X	X	X	X	X	X	X	X

Bit	b15	b14	b13	b12	b11	b10	b9	b8
Symbol	SUM	PER	FER	OER	—	—	—	MPRB
After Reset	X	X	X	X	X	X	X	X

Bit	Symbol	Bit Name	Function	R/W
b0	—	—	Receive data (D7 to D0)	R
b1	—			
b2	—			
b3	—			
b4	—			
b5	—			
b6	—			
b7	—			
b8	MPRB	—	Receive data (D8) <sup>(1)</sup> [When the multiprocessor communication function is not used] Receive data (D8) [When the multiprocessor communication function is used] • When the MPRB bit is set to 0, received D0 to D7 are data fields. • When the MPRB bit is set to 1, received D0 to D7 are ID fields.	R
b9	—	Nothing is assigned. If necessary, set to 0. When read, the content is undefined.		—
b10	—			
b11	—	Reserved bit	Set to 0.	R/W
b12	OER	Overrun error flag <sup>(1)</sup>	0: No overrun error 1: Overrun error	R
b13	FER	Framing error flag <sup>(1, 2)</sup>	0: No framing error 1: Framing error	R
b14	PER	Parity error flag <sup>(1, 2)</sup>	0: No parity error 1: Parity error	R
b15	SUM	Error sum flag <sup>(1, 2)</sup>	0: No error 1: Error	R

## Notes:

- When bits SMD2 to SMD0 in the U2MR register are set to 000b (serial interface disabled) or the RE bit in the U2C1 register is set to 0 (reception disabled), all of bits SUM, PER, FER, and OER are set to 0 (no error). The SUM bit is set to 0 (no error) when all of bits PER, FER, and OER are set to 0 (no error). Bits PER and FER are set to 0 by reading the lower byte of the U2RB register.  
When setting bits SMD2 to SMD0 in the U2MR register to 000b, set the TE bit in the U2C1 register to 0 (transmission disabled) and the RE bit to 0 (reception disabled).
- These error flags are disabled when bits SMD2 to SMD0 in the U2MR register are set to 001b (clock synchronous serial I/O mode) or to 010b (I<sup>2</sup>C mode). When read, the content is undefined.

### 21.2.7 UART2 Digital Filter Function Select Register (URXDF)

Address 00B0h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	—	DF2EN	—	—
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b1	—			—
b2	DF2EN	RXD2 digital filter enable bit <sup>(1)</sup>	0: RXD2 digital filter disabled 1: RXD2 digital filter enabled	R/W
b3	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b4	—			—
b5	—			—
b6	—			—
b7	—			—

Note:

1. The RXD2 digital filter can be used only in clock asynchronous serial I/O (UART) mode. When bits SMD2 to SMD0 in the U2MR register are set to 001b (clock synchronous serial I/O mode) or 010b (I<sup>2</sup>C mode), set the DF2EN bit to 0 (RXD2 digital filter disabled).

### 21.2.8 UART2 Special Mode Register 5 (U2SMR5)

Address 00BBh

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	MPIE	—	—	—	MP
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	MP	Multiprocessor communication enable bit	0: Multiprocessor communication disabled 1: Multiprocessor communication enabled <sup>(1)</sup>	R/W
b1	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b2	—			—
b3	—			—
b4	MPIE	Multiprocessor communication control bit	This bit is enabled when the MP bit is set to 1 (multiprocessor communication enabled). When the MPIE bit is set to 1, the following will result: <ul style="list-style-type: none"> <li>• Receive data in which the multiprocessor bit is 0 is ignored. Setting of the RI bit in the U2C1 register and bits OER and FER in the U2RB register to 1 is disabled.</li> <li>• On receiving receive data in which the multiprocessor bit is 1, the MPIE bit is set to 0 and receive operation other than multiprocessor communication is performed.</li> </ul>	R/W
b5	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b6	—			—
b7	—	Reserved bit	Set to 0.	R/W

Note:

1. When the MP bit is set to 1 (multiprocessor communication enabled), the settings of bits PRY and PRYE in the U2MR register are disabled. If bits SMD2 to SMD0 in the U2MR register are set to 001b (clock synchronous serial I/O mode), set the MP bit to 0 (multiprocessor communication disabled).

### 21.2.9 UART2 Special Mode Register 4 (U2SMR4)

Address 00BCh

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	SWC9	SCLHI	ACKC	ACKD	STSPSEL	STPREQ	RSTAREQ	STAREQ
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	STAREQ	Start condition generate bit <sup>(1)</sup>	0: Clear 1: Start	R/W
b1	RSTAREQ	Restart condition generate bit <sup>(1)</sup>	0: Clear 1: Start	R/W
b2	STPREQ	Stop condition generate bit <sup>(1)</sup>	0: Clear 1: Start	R/W
b3	STSPSEL	SCL, SDA output select bit	0: Start and stop conditions not output 1: Start and stop conditions output	R/W
b4	ACKD	ACK data bit	0: ACK 1: NACK	R/W
b5	ACKC	ACK data output enable bit	0: Serial interface data output 1: ACK data output	R/W
b6	SCLHI	SCL output stop enable bit	0: Disabled 1: Enabled	R/W
b7	SWC9	SCL wait bit 3	0: SCL "L" hold disabled 1: SCL "L" hold enabled	R/W

Note:

1. This bit is set to 0 when each condition is generated.

### 21.2.10 UART2 Special Mode Register 3 (U2SMR3)

Address 00BDh

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	DL2	DL1	DL0	—	NODC	—	CKPH	—
After Reset	0	0	0	X	0	X	0	X

Bit	Symbol	Bit Name	Function	R/W
b0	—	Nothing is assigned. If necessary, set to 0. When read, the content is undefined.		—
b1	CKPH	Clock phase set bit	0: No clock delay 1: With clock delay	R/W
b2	—	Nothing is assigned. If necessary, set to 0. When read, the content is undefined.		—
b3	NODC	Clock output select bit	0: CLK2 set to CMOS output 1: CLK2 set to N-channel open-drain output	R/W
b4	—	Nothing is assigned. If necessary, set to 0. When read, the content is undefined.		—
b5	DL0	SDA2 digital delay setup bit <sup>(1, 2)</sup>	b7 b6 b5 0 0 0: No delay 0 0 1: 1 to 2 cycle(s) of U2BRG count source 0 1 0: 2 to 3 cycles of U2BRG count source 0 1 1: 3 to 4 cycles of U2BRG count source 1 0 0: 4 to 5 cycles of U2BRG count source 1 0 1: 5 to 6 cycles of U2BRG count source 1 1 0: 6 to 7 cycles of U2BRG count source 1 1 1: 7 to 8 cycles of U2BRG count source	R/W
b6	DL1			R/W
b7	DL2			R/W

Notes:

1. Bits DL2 to DL0 are used to generate a delay in SDA2 output digitally in I<sup>2</sup>C mode. In other than I<sup>2</sup>C mode, set these bits to 000b (no delay).
2. The amount of delay varies with the load on pins SCL2 and SDA2. When an external clock is used, the amount of delay increases by about 100 ns.

### 21.2.11 UART2 Special Mode Register 2 (U2SMR2)

Address 00BEh

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	SDHI	SWC2	STAC	—	SWC	CSC	IICM2
After Reset	X	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	IICM2	I <sup>2</sup> C mode select bit 2	Refer to <b>Table 21.12 I<sup>2</sup>C Mode Functions.</b>	R/W
b1	CSC	Clock synchronization bit	0: Disabled 1: Enabled	R/W
b2	SWC	SCL wait output bit	0: Disabled 1: Enabled	R/W
b3	—	Reserved bit	Set to 0.	R/W
b4	STAC	UART2 initialization bit	0: Disabled 1: Enabled	R/W
b5	SWC2	SCL wait output bit 2	0: Transfer clock 1: "L" output	R/W
b6	SDHI	SDA output disable bit	0: Enabled 1: Disabled (high-impedance)	R/W
b7	—	Nothing is assigned. If necessary, set to 0. When read, the content is undefined.		—

### 21.2.12 UART2 Special Mode Register (U2SMR)

Address 00BFh

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	—	BBS	—	IICM
After Reset	X	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	IICM	I <sup>2</sup> C mode select bit	0: Other than I <sup>2</sup> C mode 1: I <sup>2</sup> C mode	R/W
b1	—	Reserved bit	Set to 0.	R/W
b2	BBS	Bus busy flag <sup>(1)</sup>	0: Stop condition detected 1: Start condition detected (busy)	R/W
b3	—	Reserved bits	Set to 0.	R/W
b4	—			
b5	—			
b6	—			
b7	—	Nothing is assigned. If necessary, set to 0. When read, the content is undefined.		—

Note:

1. The BBS bit is set to 0 by writing 0 by a program (Writing 1 has no effect).

**21.2.13 UART2 Pin Select Register 0 (U2SR0)**

Address 018Ah

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	RXD2SEL2	RXD2SEL1	RXD2SEL0	—	TXD2SEL2	TXD2SEL1	TXD2SEL0
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W

b7	—	Reserved bit	Set to 0.	R/W

The U2SR0 register selects which pin is assigned to the UART2 I/O. To use the I/O pin for UART2, set this register.

Set the U2SR0 register before setting the UART2 associated registers. Also, do not change the setting value in this register during UART2 operation.

### 21.2.14 UART2 Pin Select Register 1 (U2SR1)

Address 018Bh

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	CTS2SEL1	CTS2SEL0	—	CLK2SEL2	CLK2SEL1	CLK2SEL0
After Reset	0	0	0	0	0	0	0	0

b6	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—	
b7	—				

The U2SR1 register selects which pin is assigned to the UART2 I/O. To use the I/O pin for UART2, set this register.

Set the U2SR1 register before setting the UART2 associated registers. Also, do not change the setting value in this register during UART2 operation.

### 21.2.15 Low-Voltage Signal Mode Control Register (TSMR)

Address 0190h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	I3LVM	I2LVM	I1LVM	I0LVM	U2LVM	U1LVM	U0LVM	LVMPR
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	LVMPR	Low-voltage signal mode protect bit	0: Write disabled 1: Write enabled <sup>(1)</sup>	R/W
b1	U0LVM	UART0 low-voltage signal mode control bit <sup>(1)</sup>	0: Low-voltage signal mode disabled 1: Low-voltage signal mode enabled <sup>(2)</sup>	R/W
b2	U1LVM	UART1 low-voltage signal mode control bit <sup>(1)</sup>		R/W
b3	U2LVM	UART2 low-voltage signal mode control bit <sup>(1)</sup>		R/W
b4	I0LVM	$\overline{\text{INT0}}$ low-voltage signal mode control bit <sup>(1)</sup>	0: Low-voltage signal mode disabled 1: Low-voltage signal mode enabled	R/W
b5	I1LVM	$\overline{\text{INT1}}$ low-voltage signal mode control bit <sup>(1)</sup>		R/W
b6	I2LVM	$\overline{\text{INT2}}$ low-voltage signal mode control bit <sup>(1)</sup>		R/W
b7	I3LVM	$\overline{\text{INT3}}$ low-voltage signal mode control bit <sup>(1)</sup>		R/W

Notes:

- When the LVMPR bit is set to 1 (write enabled), writing to bits UiLVM (i = 0 to 2) and IjLVM (j = 0 to 3) is enabled. Rewrite bits UiLVM (i = 0 to 2) and IjLVM (j = 0 to 3) after setting the LVMPR bit to 1. When writing 1 to the LVMPR bit, write 0 and then 1 continuously.
- When the UiLVM (i = 0 to 2) bit is set to 1, the TxDi pin is set to N-channel open-drain output regardless of the setting of the NCH bit in the UiC0 (i = 0 to 2) register.

### 21.3 Clock Synchronous Serial I/O Mode

In clock synchronous serial I/O mode, data is transmitted and received using a transfer clock.

Table 21.2 lists the Clock Synchronous Serial I/O Mode Specifications. Table 21.3 lists the Registers Used and Settings in Clock Synchronous Serial I/O Mode.

**Table 21.2 Clock Synchronous Serial I/O Mode Specifications**

Item	Specification
Transfer data format	Transfer data length: 8 bits
Transfer clock	<ul style="list-style-type: none"> <li>The CKDIR bit in the U2MR register is set to 0 (internal clock): <math>f_j/(2(n+1))</math>  <math>f_j = f_1, f_8, f_{32}</math>  <math>n =</math> setting value in the U2BRG register: 00h to FFh</li> <li>The CKDIR bit is set to 1 (external clock): Input from the CLK2 pin</li> </ul>
Transmit/receive control	Selectable from the $\overline{\text{CTS}}$ function, $\overline{\text{RTS}}$ function, or $\overline{\text{CTS/RTS}}$ function disabled.
Transmit start conditions	To start transmission, the following requirements must be met: <sup>(1)</sup> <ul style="list-style-type: none"> <li>The TE bit in the U2C1 register is set to 1 (transmission enabled)</li> <li>The TI bit in the U2C1 register is set to 0 (data present in the U2TB register)</li> <li>If the <math>\overline{\text{CTS}}</math> function is selected, input to the CTS2 pin = "L".</li> </ul>
Receive start conditions	To start reception, the following requirements must be met: <sup>(1)</sup> <ul style="list-style-type: none"> <li>The RE bit in the U2C1 register is set to 1 (reception enabled).</li> <li>The TE bit in the U2C1 register is set to 1 (transmission enabled).</li> <li>The TI bit in the U2C1 register is set to 0 (data present in the U2TB register).</li> </ul>
Interrupt request generation timing	For transmission, one of the following conditions can be selected. <ul style="list-style-type: none"> <li>The U2IRS bit in the U2C1 register is set to 0 (transmit buffer empty): When data is transferred from the U2TB register to the UART2 transmit register (at start of transmission).</li> <li>The U2IRS bit is set to 1 (transmission completed): When data transmission from the UART2 transmit register is completed.</li> </ul> For reception <ul style="list-style-type: none"> <li>When data is transferred from the UART2 receive register to the U2RB register (at completion of reception).</li> </ul>
Error detection	Overrun error <sup>(2)</sup> This error occurs if the serial interface starts receiving the next unit of data before reading the U2RB register and receives the 7th bit of the next unit of data.
Selectable functions	<ul style="list-style-type: none"> <li>CLK polarity selection Transfer data I/O can be selected to occur synchronously with the rising or falling edge of the transfer clock.</li> <li>LSB first, MSB first selection Whether transmitting or receiving data begins with bit 0 or begins with bit 7 can be selected.</li> <li>Continuous receive mode selection Reception is enabled immediately by reading the U2RB register.</li> <li>Serial data logic switching This function inverts the logic value of the transmit/receive data.</li> </ul>

Notes:

- When an external clock is selected, the requirements must be met in either of the following states:
  - The external clock is held high when the CKPOL bit in the U2C0 register is set to 0 (transmit data output at the falling edge and receive data input at the rising edge of the transfer clock)
  - The external clock is held low when the CKPOL bit in the U2C0 register is set to 1 (transmit data output at the rising edge and receive data input at the falling edge of the transfer clock)
- If an overrun error occurs, the receive data in the U2RB register will be undefined. The IR bit in the S2RIC register does not change to 1 (interrupt requested).

**Table 21.3 Registers Used and Settings in Clock Synchronous Serial I/O Mode**

Register	Bit	Function
U2TB <sup>(1)</sup>	b0 to b7	Set transmit data.
U2RB <sup>(1)</sup>	b0 to b7	Receive data can be read.
	OER	Overrun error flag
U2BRG	b0 to b7	Set a bit rate.
U2MR <sup>(1)</sup>	SMD2 to SMD0	Set to 001b.
	CKDIR	Select the internal clock or external clock.
	IOPOL	Set to 0.
U2C0	CLK1, CLK0	Select the count source for the U2BRG register.
	CRS	Select either $\overline{\text{CTS}}$ or $\overline{\text{RTS}}$ to use functions.
	TXEPT	Transmit register empty flag
	CRD	Enable or disable the $\overline{\text{CTS}}$ or $\overline{\text{RTS}}$ function.
	NCH	Select TXD2 pin output mode.
	CKPOL	Select the transfer clock polarity.
	UFORM	Select LSB first or MSB first.
U2C1	TE	Set to 1 to enable transmission/reception.
	TI	Transmit buffer empty flag
	RE	Set to 1 to enable reception.
	RI	Receive complete flag
	U2IRS	Select the source of UART2 transmit interrupt.
	U2RRM	Set to 1 to use continuous receive mode.
	U2LCH	Set to 1 to use inverted data logic.
	U2ERE	Set to 0.
U2SMR	b0 to b7	Set to 0.
U2SMR2	b0 to b7	Set to 0.
U2SMR3	b0 to b2	Set to 0.
	NODC	Select clock output mode.
	b4 to b7	Set to 0.
U2SMR4	b0 to b7	Set to 0.
URXDF	DF2EN	Set to 0.
U2SMR5	MP	Set to 0.

Note:

1. Set the bits not listed in this table to 0 when writing to the above registers in clock synchronous serial I/O mode.

Table 21.4 lists the Pin Functions in Clock Synchronous Serial I/O Mode (Multiple Transfer Clock Output Pin Function Not Selected).

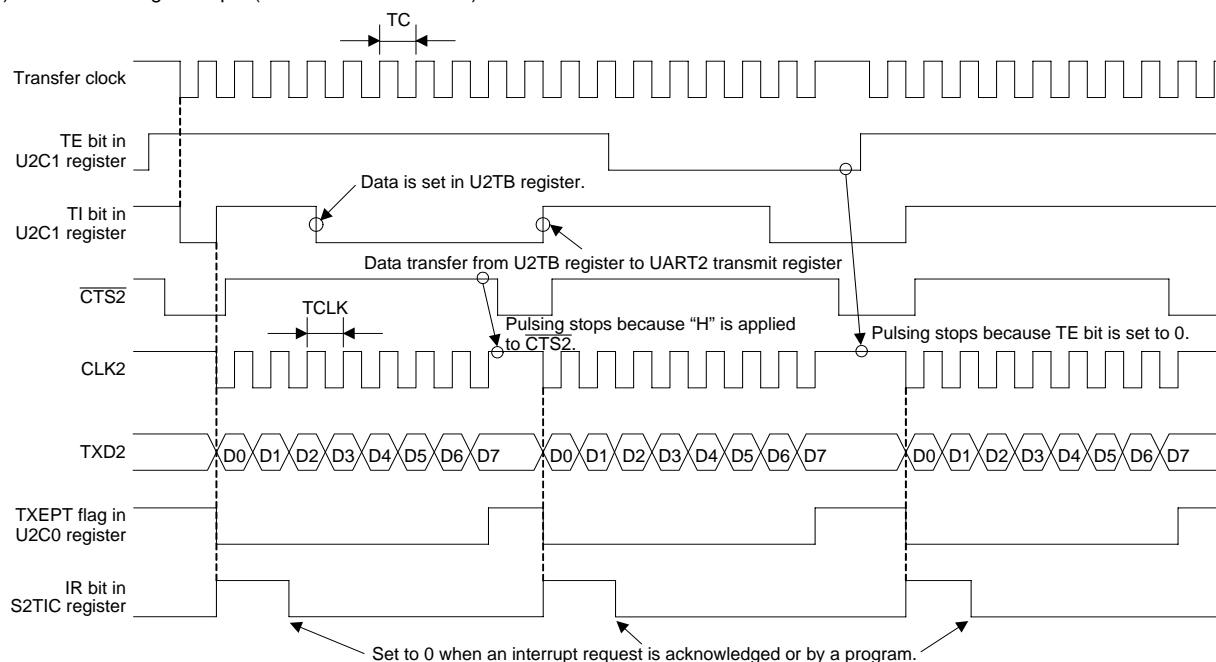

Note that for a period from when UART2 operating mode is selected to when transfer starts, the TXD2 pin outputs a “H” level. (When N-channel open-drain output is selected, this pin is in the high-impedance state.)

Figure 21.3 shows the Transmit and Receive Timing in Clock Synchronous Serial I/O Mode.

**Table 21.4 Pin Functions in Clock Synchronous Serial I/O Mode (Multiple Transfer Clock Output Pin Function Not Selected)**

Pin Name	Function	Selection Method
TXD2 (P3_4 or P3_7)	Serial data output	<ul style="list-style-type: none"> <li>• When TXD2 (P3_4) Bits TXD2SEL1 to TXD2SEL0 in U2SR0 register = 10b (P3_4)</li> <li>• When TXD2 (P3_7) Bits TXD2SEL1 to TXD2SEL0 in U2SR0 register = 01b (P3_7)</li> <li>• For reception only: P3_4 and P3_7 can be used as ports by setting TXD2SEL1 to TXD2SEL0 to 00b.</li> </ul>
RXD2 (P3_4, P3_7, or P4_5)	Serial data input	<ul style="list-style-type: none"> <li>• When RXD2 (P3_4) Bits RXD2SEL1 to RXD2SEL0 in U2SR0 register = 01b (P3_4) PD3_4 bit in PD3 register = 0</li> <li>• When RXD2 (P3_7) Bits RXD2SEL1 to RXD2SEL0 in U2SR0 register = 10b (P3_7) PD3_7 bit in PD3 register = 0</li> <li>• When RXD2 (P4_5) Bits RXD2SEL1 to RXD2SEL0 in U2SR0 register = 11b (P4_5) PD4_5 bit in PD4 register = 0</li> <li>• For transmission only: P3_4, P3_7, and P4_5 can be used as ports by setting RXD2SEL1 to RXD2SEL0 to 00b.</li> </ul>
CLK2 (P3_5)	Transfer clock output	CLK2SEL0 bit in U2SR1 register = 1 CKDIR bit in U2MR register = 0
	Transfer clock input	CLK2SEL0 bit in U2SR1 register = 1 CKDIR bit in U2MR register = 1 PD3_5 bit in PD3 register = 0
CTS2/RTS2 (P3_3)	CTS input	CTS2SEL0 bit in U2SR1 register = 1 CRD bit in U2C0 register = 0 CRS bit in U2C0 register = 0 PD3_3 bit in PD3 register = 0
	RTS output	CTS2SEL0 bit in U2SR1 register = 1 CRD bit in U2C0 register = 0 CRS bit in U2C0 register = 1
	I/O port	CTS2SEL0 bit in U2SR1 register = 0

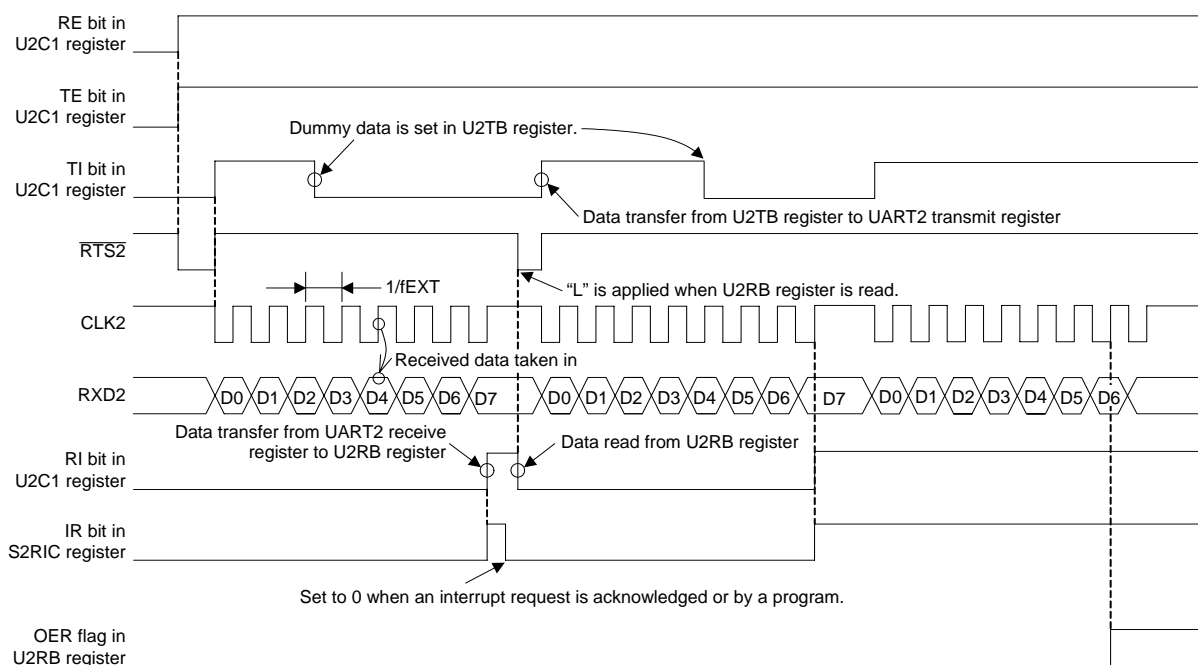

## (1) Transmit Timing Example (Internal Clock Selected)

The above applies when:

- CKDIR bit in U2MR register = 0 (internal clock)
- CRD bit in U2C0 register = 0 (CTS/RTS function enabled), CRS bit = 0 (CTS function selected)
- CKPOL bit in U2C0 register = 0 (transmit data output at the falling edge and receive data input at the rising edge of the transfer clock)
- U2IRS bit in U2C1 register = 0 (interrupt request generation when the U2TB register is empty)

## (2) Receive Timing Example (External Clock Selected)

The above applies when:

- CKDIR bit in U2MR register = 1 (external clock)
- CRD bit in U2C0 register = 0 (CTS/RTS function enabled), CRS bit = 1 (RTS function selected)
- CKPOL bit in U2C0 register = 0 (transmit data output at the falling edge and receive data input at the rising edge of the transfer clock)

Make sure the following conditions are met

- when the CLK2 pin input before receiving data is high:
- TE bit in U2C0 register = 1 (transmission enabled)
- RE bit in U2C1 register = 1 (reception enabled)
- Dummy data is written to U2TB register

fEXT: Frequency of external clock

**Figure 21.3 Transmit and Receive Timing in Clock Synchronous Serial I/O Mode**

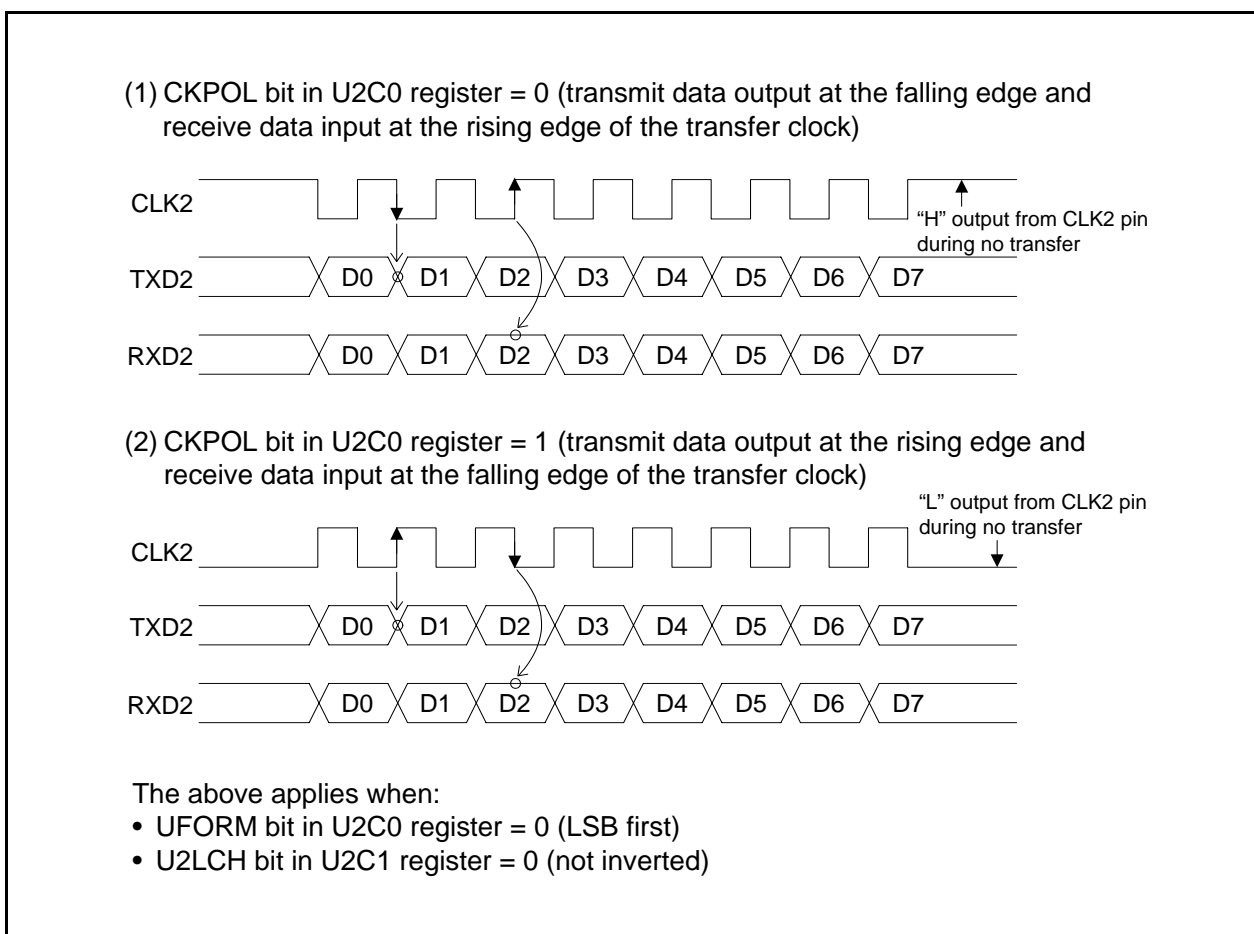

### 21.3.1 Measure for Dealing with Communication Errors

If communication is aborted or a communication error occurs while transmitting or receiving in clock synchronous serial I/O mode, follow the procedures below:

- (1) Set the TE bit in the U2C1 register to 0 (transmission disabled) and the RE bit to 0 (reception disabled).
- (2) Set bits SMD2 to SMD0 in the U2MR register to 000b (serial interface disabled).
- (3) Set bits SMD2 to SMD0 in the U2MR register to 001b (clock synchronous serial I/O mode).
- (4) Set the TE bit in the U2C1 register to 1 (transmission enabled) and the RE bit to 1 (reception enabled).

### 21.3.2 CLK Polarity Select Function

Use the CKPOL bit in the U2C0 register to select the transfer clock polarity. Figure 21.4 shows the Transfer Clock Polarity.

**Figure 21.4** Transfer Clock Polarity

### 21.3.3 LSB First/MSB First Select Function

Use the UFORM bit in the U2C0 register to select the transfer format. Figure 21.5 shows the Transfer Format.

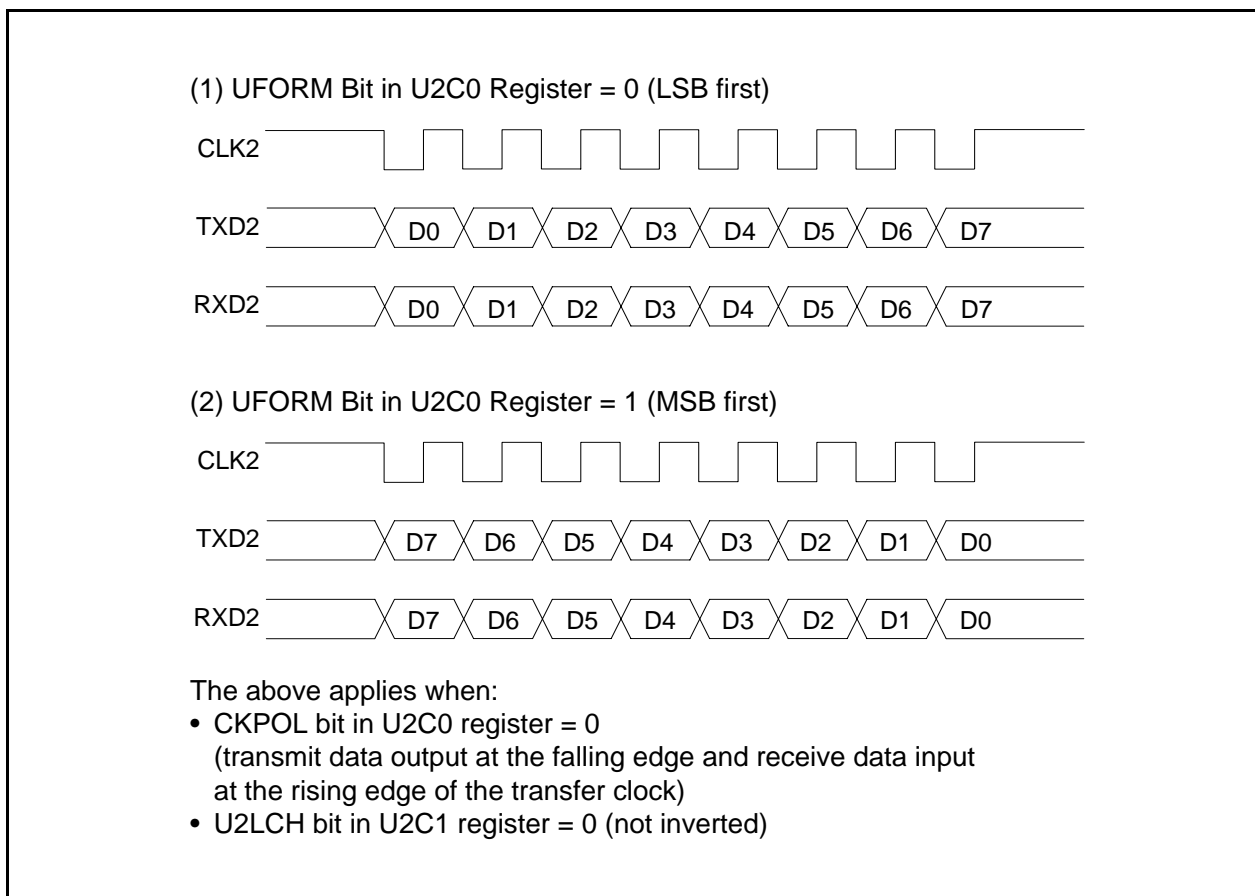

Figure 21.5 Transfer Format

### 21.3.4 Continuous Receive Mode

In continuous receive mode, receive operation is enabled when the receive buffer register is read. It is not necessary to write dummy data to the transmit buffer register to enable receive operation in this mode. However, a dummy read of the receive buffer register is required when starting the operating mode.

When the U2RRM bit in the U2C1 register is set to 1 (continuous receive mode), the TI bit in the U2C1 register is set to 0 (data present in the U2TB register) by reading the U2RB register. If the U2RRM bit is set to 1, do not write dummy data to the U2TB register by a program.

### 21.3.5 Serial Data Logic Switching Function

If the U2LCH bit in the U2C1 register is set to 1 (inverted), the data written to the U2TB register has its logic inverted before being transmitted. Similarly, the received data has its logic inverted when read from the U2RB register. Figure 21.6 shows the Serial Data Logic Switching.

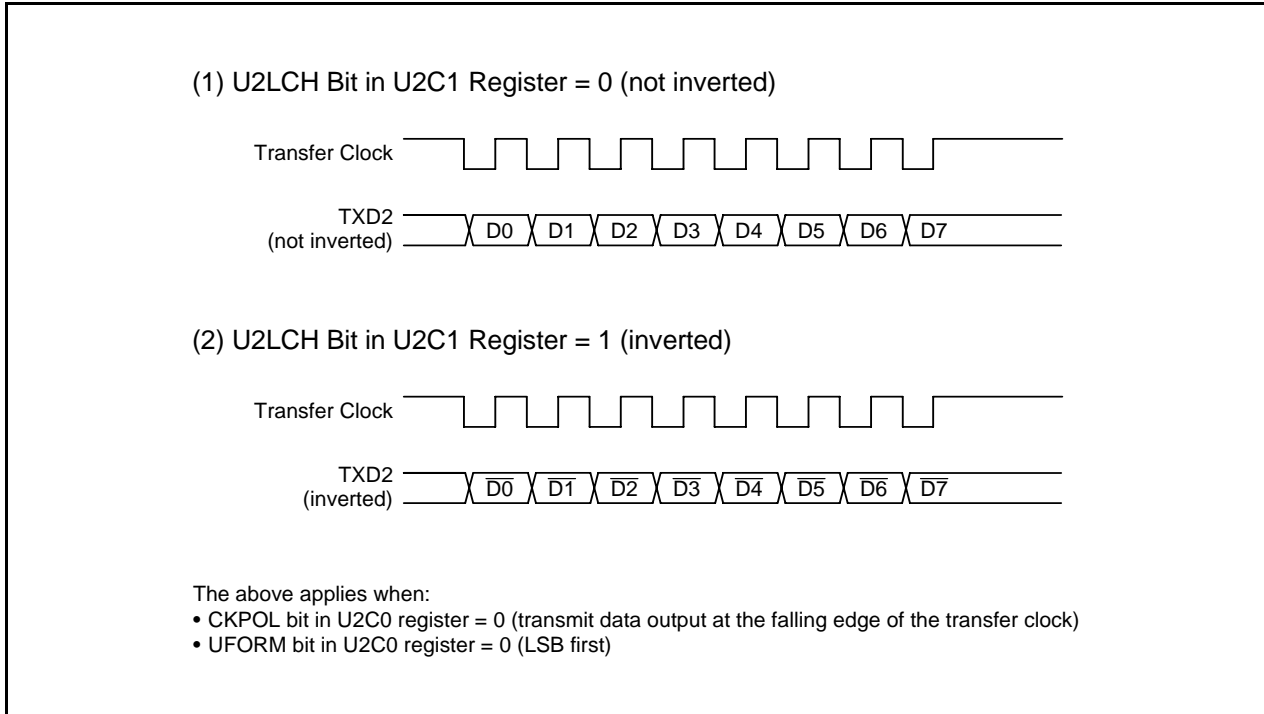

Figure 21.6 Serial Data Logic Switching

### 21.3.6 CTS/RTS Function

The  $\overline{\text{CTS}}$  function is used to start transmit and receive operation when “L” is applied to the  $\overline{\text{CTS2/RTS2}}$  pin. Transmit and receive operation begins when the  $\overline{\text{CTS2/RTS2}}$  pin is held low. If the “L” signal is switched to “H” during a transmit or receive operation, the operation stops before the next data.

For the  $\overline{\text{RTS}}$  function, the  $\overline{\text{CTS2/RTS2}}$  pin outputs “L” when the MCU is ready for a receive operation. The output level goes high at the first falling edge of the CLK2 pin.

- The CRD bit in the U2C0 register = 1 ( $\overline{\text{CTS/RTS}}$  function disabled)  
The  $\overline{\text{CTS2/RTS2}}$  pin operates as the programmable I/O function.
- The CRD bit = 0, CRS bit = 0 ( $\overline{\text{CTS}}$  function selected)  
The  $\overline{\text{CTS2/RTS2}}$  pin operates as the CTS function.
- The CRD bit = 0, CRS bit = 1 ( $\overline{\text{RTS}}$  function selected)  
The  $\overline{\text{CTS2/RTS2}}$  pin operates as the RTS function.

## 21.4 Clock Asynchronous Serial I/O (UART) Mode

In UART mode, data is transmitted and received after setting the desired bit rate and transfer data format. Table 21.5 lists the UART Mode Specifications. Table 21.6 lists the Registers Used and Settings in UART Mode.

**Table 21.5 UART Mode Specifications**

Item	Specification
Transfer data format	<ul style="list-style-type: none"> <li>• Character bits (transfer data): Selectable from 7, 8, or 9 bits</li> <li>• Start bit: 1 bit</li> <li>• Parity bit: Selectable from odd, even, or none</li> <li>• Stop bits: Selectable from 1 bit or 2 bits</li> </ul>
Transfer clock	<ul style="list-style-type: none"> <li>• The CKDIR bit in the U2MR register is set to 0 (internal clock): <math>f_j/(16(n+1))</math>  <math>f_j = f_1, f_8, f_{32}</math>  <math>n =</math> setting value in the U2BRG register: 00h to FFh</li> <li>• The CKDIR bit is set to 1 (external clock): <math>f_{EXT}/(16(n+1))</math>  <math>f_{EXT}</math>: Input from CLK2 pin  <math>n</math>: Setting value in the U2BRG register: 00h to FFh</li> </ul>
Transmit/receive control	Selectable from the $\overline{CTS}$ function, $\overline{RTS}$ function, or $\overline{CTS}/\overline{RTS}$ function disabled.
Transmit start conditions	To start transmission, the following requirements must be met: <ul style="list-style-type: none"> <li>• The TE bit in the U2C1 register is set to 1 (transmission enabled).</li> <li>• The TI bit in the U2C1 register is set to 0 (data present in the U2TB register).</li> <li>• If the <math>\overline{CTS}</math> function is selected, input to the CTS2 pin = "L".</li> </ul>
Receive start conditions	To start reception, the following requirements must be met: <ul style="list-style-type: none"> <li>• The RE bit in the U2C1 register is set to 1 (reception enabled).</li> <li>• Start bit detection</li> </ul>
Interrupt request generation timing	For transmission, one of the following conditions can be selected. <ul style="list-style-type: none"> <li>• The U2IRS bit in the U2C1 register is set to 0 (transmit buffer empty):                When data is transferred from the U2TB register to the UART2 transmit register (at start of transmission).</li> <li>• The U2IRS bit is set to 1 (transmission completed):                When data transmission from the UART2 transmit register is completed.</li> </ul> For reception <ul style="list-style-type: none"> <li>• When data is transferred from the UART2 receive register to the U2RB register (at completion of reception).</li> </ul>
Error detection	<ul style="list-style-type: none"> <li>• Overrun error <sup>(1)</sup>                This error occurs if the serial interface starts receiving the next unit of data before reading the U2RB register and receives the bit one before the last stop bit of the next unit of data.</li> <li>• Framing error <sup>(2)</sup>                This error occurs when the set number of stop bits is not detected.</li> <li>• Parity error <sup>(2)</sup>                This error occurs when if parity is enabled, the number of 1's in the parity and character bits does not match the set number of 1's.</li> <li>• Error sum flag                This flag is set to 1 if an overrun, framing, or parity error occurs.</li> </ul>
Selectable functions	<ul style="list-style-type: none"> <li>• LSB first, MSB first selection                Whether transmitting or receiving data begins with bit 0 or begins with bit 7 can be selected.</li> <li>• Serial data logic switching                This function inverts the logic of the transmit/receive data. The start and stop bits are not inverted.</li> <li>• TXD, RXD I/O polarity switching                This function inverts the polarities of the TXD pin output and RXD pin input. The logic levels of all I/O data are inverted.</li> <li>• RXD2 digital filter selection                The RXD2 input signal can be enabled or disabled.</li> </ul>

Notes:

1. If an overrun error occurs, the receive data in the U2RB register will be undefined. The IR bit in the S2RIC register remains unchanged.
2. The framing error flag and the parity error flag are set to 1 when data is transferred from the UART2 receive register to the U2RB register.

**Table 21.6 Registers Used and Settings in UART Mode**

Register	Bit	Function
U2TB	b0 to b8	Set transmit data. <sup>(1)</sup>
U2RB	b0 to b8	Receive data can be read. <sup>(1, 2)</sup>
	OER, FER, PER, SUM	Error flag
U2BRG	b0 to b7	Set a bit rate.
U2MR	SMD2 to SMD0	Set to 100b when transfer data is 7 bits long. Set to 101b when transfer data is 8 bits long. Set to 110b when transfer data is 9 bits long.
	CKDIR	Select the internal clock or external clock.
	STPS	Select the stop bit.
	PRY, PRYE	Select whether parity is included and whether odd or even.
	IOPOL	Select the TXD/RXD I/O polarity.
U2C0	CLK0, CLK1	Select the count source for the U2BRG register.
	CRS	Select $\overline{\text{CTS}}$ or $\overline{\text{RTS}}$ to use functions.
	TXEPT	Transmit register empty flag
	CRD	Enable or disable the $\overline{\text{CTS}}$ or $\overline{\text{RTS}}$ function.
	NCH	Select TXD2 pin output mode.
	CKPOL	Set to 0.
	UFORM	Select LSB first or MSB first when transfer data is 8 bits long. Set to 0 when transfer data is 7 or 9 bits long.
U2C1	TE	Set to 1 to enable transmission.
	TI	Transmit buffer empty flag
	RE	Set to 1 to enable reception.
	RI	Receive complete flag
	U2IRS	Select the UART2 transmit interrupt source.
	U2RRM	Set to 0.
	U2LCH	Set to 1 to use inverted data logic.
	U2ERE	Set to 0.
U2SMR	b0 to b7	Set to 0.
U2SMR2	b0 to b7	Set to 0.
U2SMR3	b0 to b7	Set to 0.
U2SMR4	b0 to b7	Set to 0.
URXDF	DF2EN	Select the digital filter disabled or enabled.
U2SMR5	MP	Set to 0.

**Notes:**

- The bits used for transmit/receive data are as follows:
  - Bits b0 to b6 when transfer data is 7 bits long
  - Bits b0 to b7 when transfer data is 8 bits long
  - Bits b0 to b8 when transfer data is 9 bits long
- The contents of the following are undefined:
  - Bits b7 and b8 when transfer data is 7 bits long
  - Bit b8 when transfer data is 8 bits long

Table 21.7 lists the I/O Pin Functions in UART Mode.

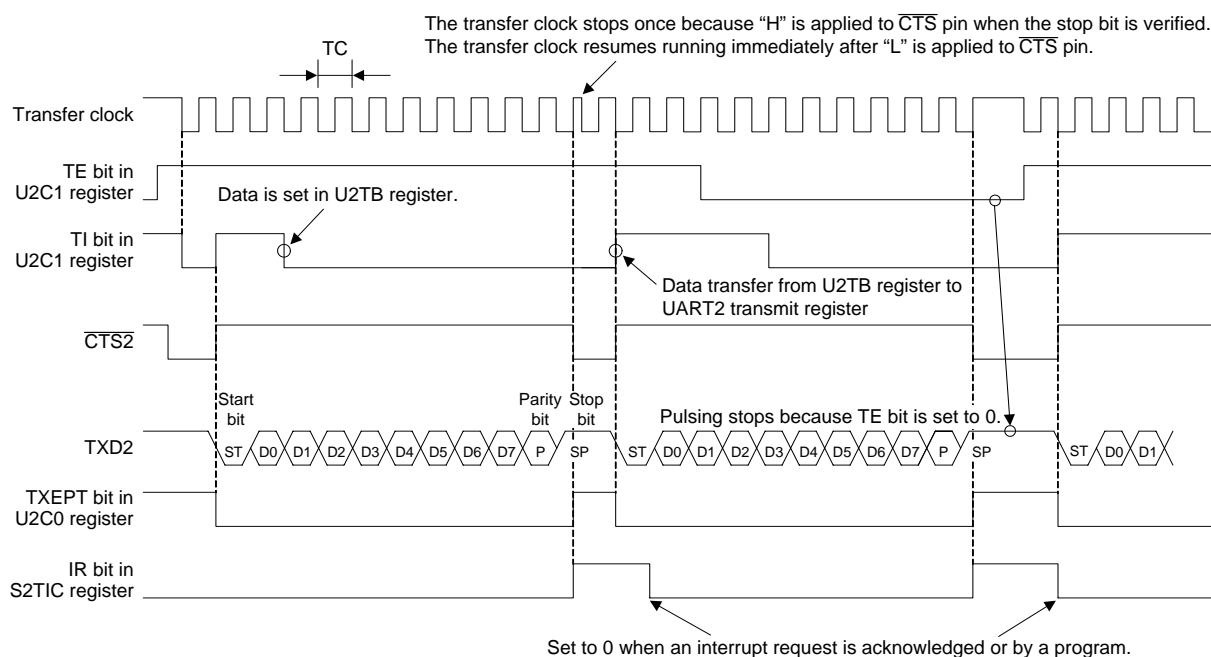

Note that for a period from when the UART2 operating mode is selected to when transfer starts, the TXD2 pin outputs “H”. (When N-channel open-drain output is selected, this pin is in the high-impedance state.)

Figure 21.7 shows the Transmit Timing in UART Mode. Figure 21.8 shows the Receive Timing in UART Mode.

**Table 21.7 I/O Pin Functions in UART Mode**

Pin Name	Function	Selection Method
TXD2 (P3_4 or P3_7)	Serial data output	<ul style="list-style-type: none"> <li>• When TXD2 (P3_4) Bits TXD2SEL1 to TXD2SEL0 in U2SR0 register = 10b (P3_4)</li> <li>• When TXD2 (P3_7) Bits TXD2SEL1 to TXD2SEL0 in U2SR0 register = 01b (P3_7)</li> <li>• For reception only: P3_4 and P3_7 can be used as ports by setting TXD2SEL1 to TXD2SEL0 to 00b.</li> </ul>
RXD2 (P3_4, P3_7, or P4_5)	Serial data input	<ul style="list-style-type: none"> <li>• When RXD2 (P3_4) Bits RXD2SEL1 to RXD2SEL0 in U2SR0 register = 01b (P3_4) PD3_4 bit in PD3 register = 0</li> <li>• When RXD2 (P3_7) Bits RXD2SEL1 to RXD2SEL0 in U2SR0 register = 10b (P3_7) PD3_7 bit in PD3 register = 0</li> <li>• When RXD2 (P4_5) Bits RXD2SEL1 to RXD2SEL0 in U2SR0 register = 11b (P4_5) PD4_5 bit in PD4 register = 0</li> <li>• For transmission only: P3_4, P3_7, and P4_5 can be used as ports by setting RXD2SEL1 to RXD2SEL0 to 00b.</li> </ul>
CLK2 (P3_5)	I/O port	CLK2SEL0 bit in U2SR1 register = 0
	Transfer clock input	CLK2SEL0 bit in U2SR1 register = 1 CKDIR bit in U2MR register = 1 PD3_5 bit in PD3 register = 0
CTS2/RTS2 (P3_3)	CTS input	CTS2SEL0 bit in U2SR1 register = 1 CRD bit in U2C0 register = 0 CRS bit in U2C0 register = 0 PD3_3 bit in PD3 register = 0
	RTS output	CTS2SEL0 bit in U2SR1 register = 1 CRD bit in U2C0 register = 0 CRS bit in U2C0 register = 1
	I/O port	CTS2SEL0 bit in U2SR1 register = 0

## (1) Transmit Timing Example When Transfer Data 8 Bits is Long (Parity Enabled, One Stop Bit)

The above applies when:

- PRYE bit in U2MR register = 1 (parity enabled)
- STPS bit in U2MR register = 0 (one stop bit)
- CRD bit in U2C0 register = 0 ( $\overline{\text{CTS}}$ /RTS function enabled), CRS bit = 0 ( $\overline{\text{CTS}}$  function selected)
- U2IRS bit in U2C1 register = 1 (interrupt request generation when transmission is completed)

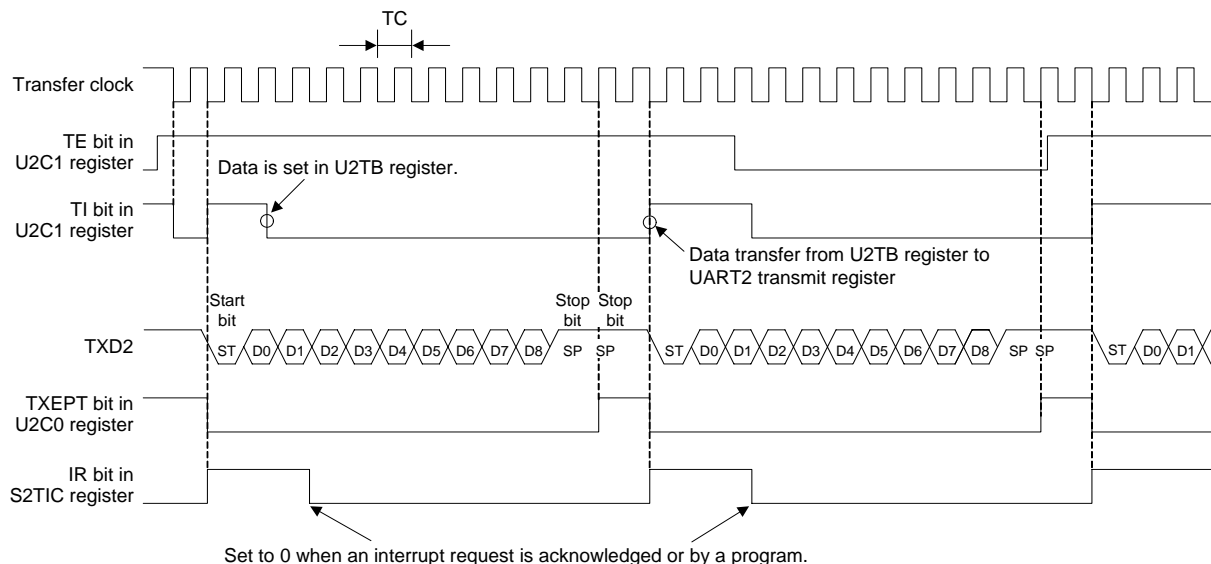

$$\text{TC} = 16(n+1)/f_j \text{ or } 16(n+1)/f_{\text{EXT}}$$

$f_j$ : Frequency of U2BRG count source ( $f_1$ ,  $f_8$ ,  $f_{32}$ )

$f_{\text{EXT}}$ : Frequency of U2BRG count source (external clock)

$n$ : Setting value in U2BRG

## (2) Transmit Timing Example When Transfer Data 9 Bits is Long (Parity Disabled, Two Stop Bits)

The above applies when:

- PRYE bit in U2MR register = 0 (parity disabled)
- STPS bit in U2MR register = 1 (two stop bits)
- CRD bit in U2C0 register = 1 ( $\overline{\text{CTS}}$ /RTS function disabled)
- U2IRS bit in U2C1 register = 0 (interrupt request generation when the transmit buffer is empty)

$$\text{TC} = 16(n+1)/f_j \text{ or } 16(n+1)/f_{\text{EXT}}$$

$f_j$ : Frequency of U2BRG count source ( $f_1$ ,  $f_8$ ,  $f_{32}$ )

$f_{\text{EXT}}$ : Frequency of U2BRG count source (external clock)

$n$ : Setting value in U2BRG

Figure 21.7 Transmit Timing in UART Mode

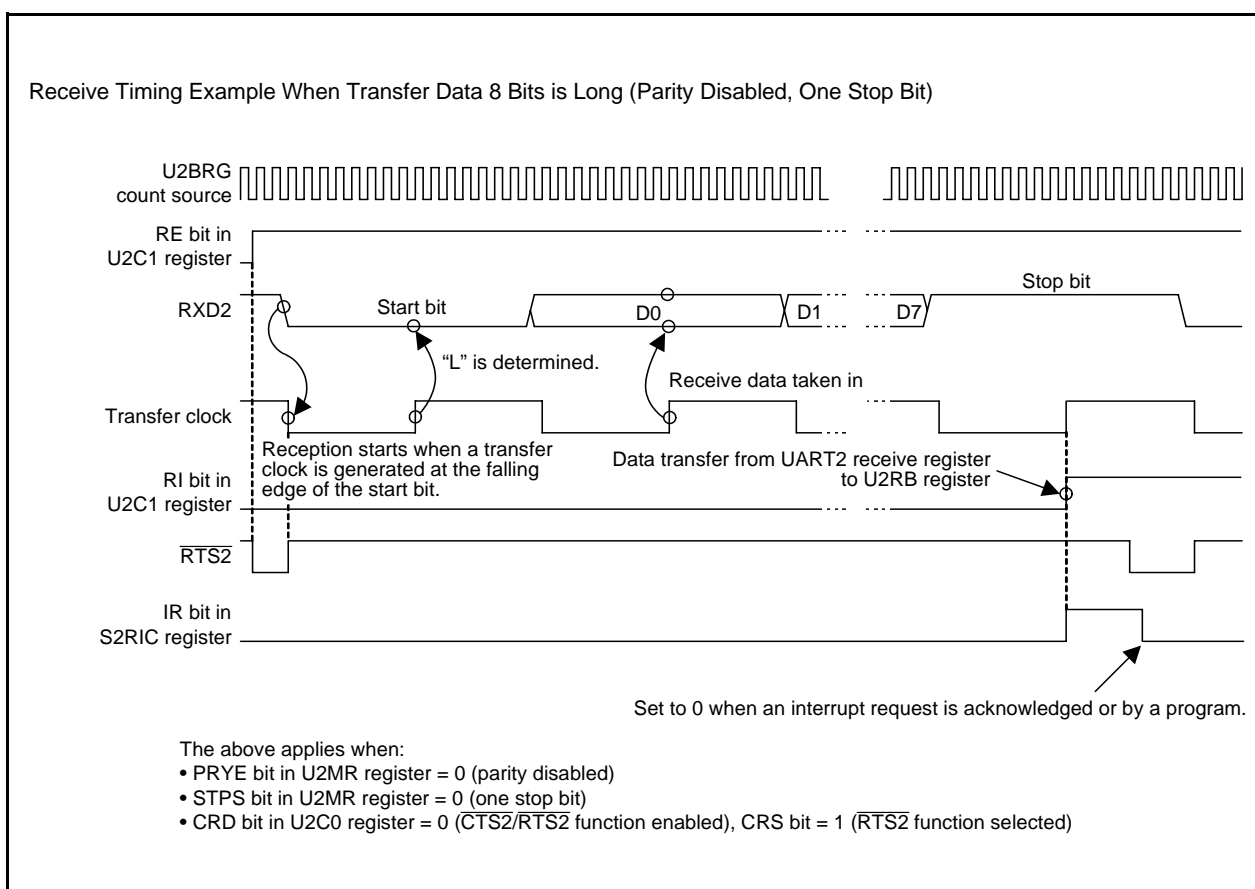

Figure 21.8 Receive Timing in UART Mode

### 21.4.1 Bit Rate

In UART mode, the bit rate is the frequency divided by the U2BRG register divided by 16. Table 21.8 lists the Bit Rate Setting Example in UART Mode (Internal Clock Selected).

Table 21.8 Bit Rate Setting Example in UART Mode (Internal Clock Selected)

Bit Rate (bps)	U2BRG Count Source	System Clock = 20 MHz			System Clock = 18.432 MHz <sup>(1)</sup>			System Clock = 8 MHz		
		U2BRG Setting Value	Actual Time (bps)	Setting Error (%)	U2BRG Setting Value	Actual Time (bps)	Setting Error (%)	U2BRG Setting Value	Actual Time (bps)	Setting Error (%)
1200	f8	129 (81h)	1201.92	0.16	119 (77h)	1200.00	0.00	51 (33h)	1201.92	0.16
2400	f8	64 (40h)	2403.85	0.16	59 (3Bh)	2400.00	0.00	25 (19h)	2403.85	0.16
4800	f8	32 (20h)	4734.85	-1.36	29 (1Dh)	4800.00	0.00	12 (0Ch)	4807.69	0.16
9600	f1	129 (81h)	9615.38	0.16	119 (77h)	9600.00	0.00	51 (33h)	9615.38	0.16
14400	f1	86 (56h)	14367.82	-0.22	79 (4Fh)	14400.00	0.00	34 (22h)	14285.71	-0.79
19200	f1	64 (40h)	19230.77	0.16	59 (3Bh)	19200.00	0.00	25 (19h)	19230.77	0.16
28800	f1	42 (2Ah)	29069.77	0.94	39 (27h)	28800.00	0.00	16 (10h)	29411.76	2.12
38400	f1	32 (20h)	37878.79	-1.36	29 (1Dh)	38400.00	0.00	12 (0Ch)	38461.54	0.16
57600	f1	21 (15h)	56818.18	-1.36	19 (13h)	57600.00	0.00	8 (08h)	55555.56	-3.55
115200	f1	10 (0Ah)	113636.36	-1.36	9 (09h)	115200.00	0.00	—	—	—

Note:

1. For the high-speed on-chip oscillator, the correction value in the FRA4 register should be written into the FRA1 register and the correction value in the FRA5 register should be written into the FRA3 register. This applies when the high-speed on-chip oscillator is selected as the system clock and bits FRA22 to FRA20 in the FRA2 register are set to 000b (divide-by-2 mode). For the precision of the high-speed on-chip oscillator, refer to **27. Electrical Characteristics**.

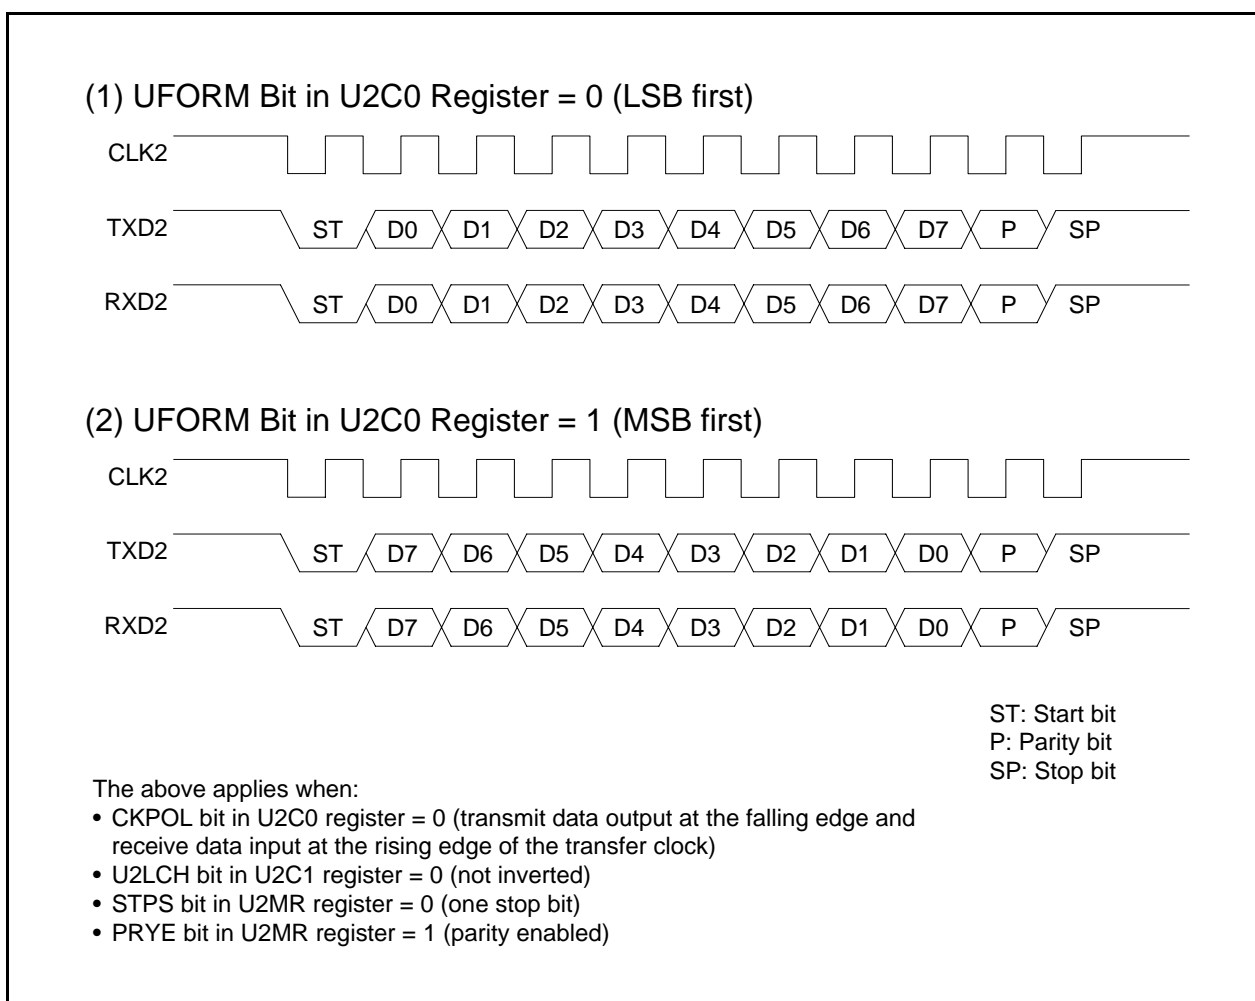

### 21.4.2 Measure for Dealing with Communication Errors

If communication is aborted or a communication error occurs while transmitting or receiving in UART mode, follow the procedures below:

- (1) Set the TE bit in the U2C1 register to 0 (transmission disabled) and the RE bit to 0 (reception disabled).
- (2) Set bits SMD2 to SMD0 in the U2MR register to 000b (serial interface disabled).
- (3) Set bits SMD2 to SMD0 in the U2MR register to 100b (UART mode, transfer data 7 bits long), 101b (UART mode, transfer data 8 bits long), or 110b (UART mode, transfer data 9 bits long).
- (4) Set the TE bit in the U2C1 register to 1 (transmission enabled) and the RE bit to 1 (reception enabled).

### 21.4.3 LSB First/MSB First Select Function

As shown in Figure 21.9, use the UFORM bit in the U2C0 register to select the transfer format. This function is enabled when transfer data is 8 bits long. Figure 21.9 shows the Transfer Format.

**Figure 21.9** Transfer Format

### 21.4.4 Serial Data Logic Switching Function

The data written to the U2TB register has its logic inverted before being transmitted. Similarly, the received data has its logic inverted when read from the U2RB register. Figure 21.10 shows the Serial Data Logic Switching.

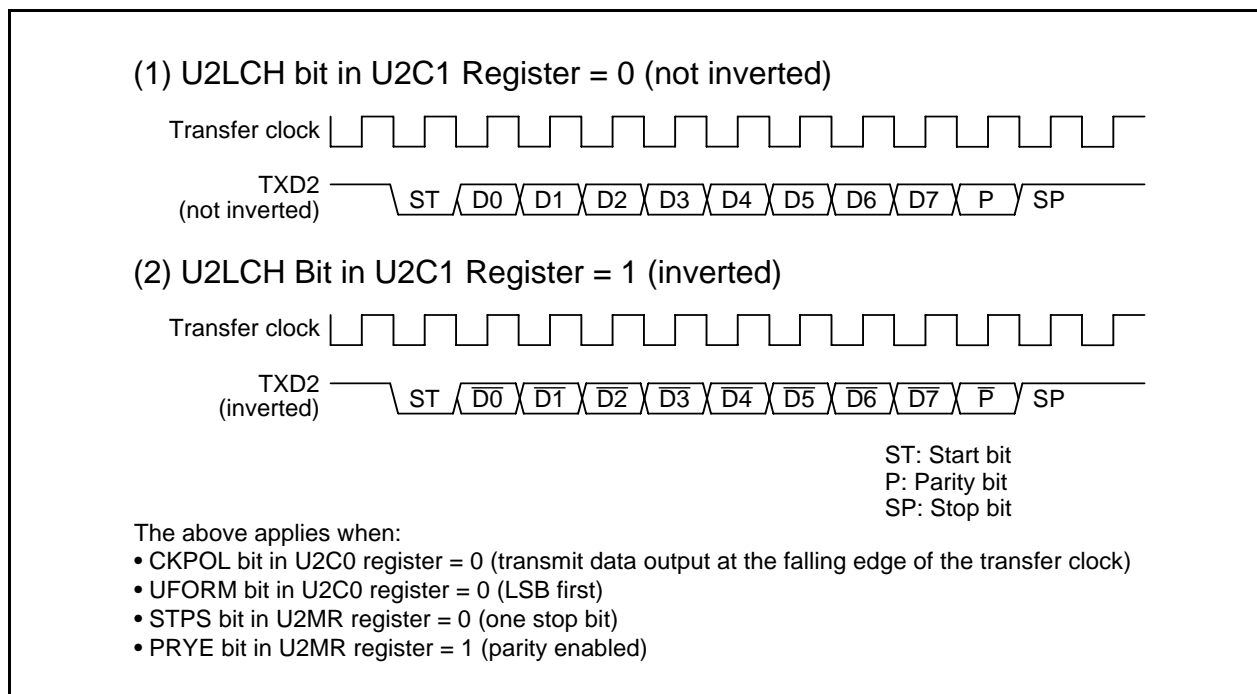

Figure 21.10 Serial Data Logic Switching

### 21.4.5 TXD and RXD I/O Polarity Inverse Function

This function inverts the polarities of the TXD2 pin output and RXD2 pin input. The logic levels of all I/O data (including bits for start, stop, and parity) are inverted. Figure 21.11 shows the TXD and RXD I/O Inversion.

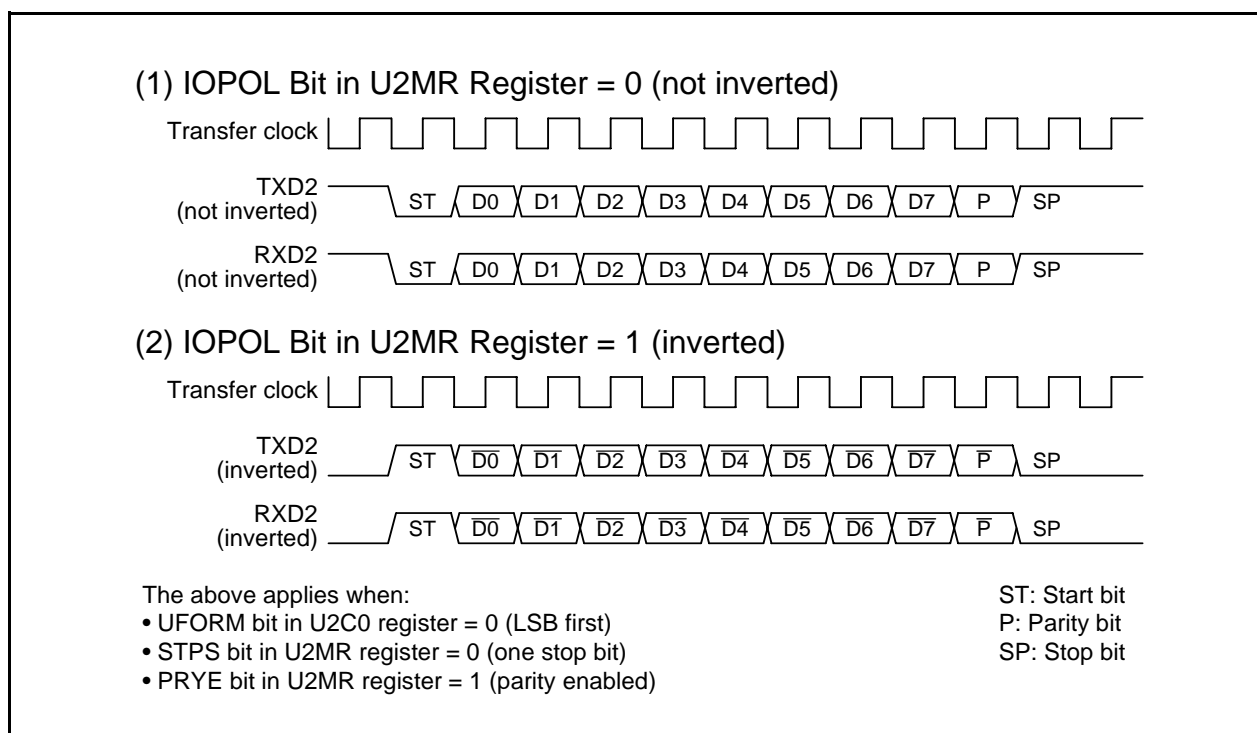

Figure 21.11 TXD and RXD I/O Inversion

### 21.4.6 $\overline{\text{CTS}}/\overline{\text{RTS}}$ Function

The  $\overline{\text{CTS}}$  function is used to start transmit operation when “L” is applied to the  $\overline{\text{CTS2}}/\overline{\text{RTS2}}$  pin. Transmit operation begins when the  $\overline{\text{CTS2}}/\overline{\text{RTS2}}$  pin is held low. If the “L” signal is switched to “H” during transmit operation, the operation stops after the ongoing transmit/receive operation is completed.

When the  $\overline{\text{RTS}}$  function is used, the  $\overline{\text{CTS2}}/\overline{\text{RTS2}}$  pin outputs “L” when the MCU is ready for a receive operation. The output level goes high at the first falling edge of the CLK2 pin.

- The CRD bit in the U2C0 register = 1 ( $\overline{\text{CTS}}/\overline{\text{RTS}}$  function disabled)

The  $\overline{\text{CTS2}}/\overline{\text{RTS2}}$  pin operates as the programmable I/O function.

- The CRD bit = 0, CRS bit = 0 ( $\overline{\text{CTS}}$  function selected)

The  $\overline{\text{CTS2}}/\overline{\text{RTS2}}$  pin operates as the  $\overline{\text{CTS}}$  function.

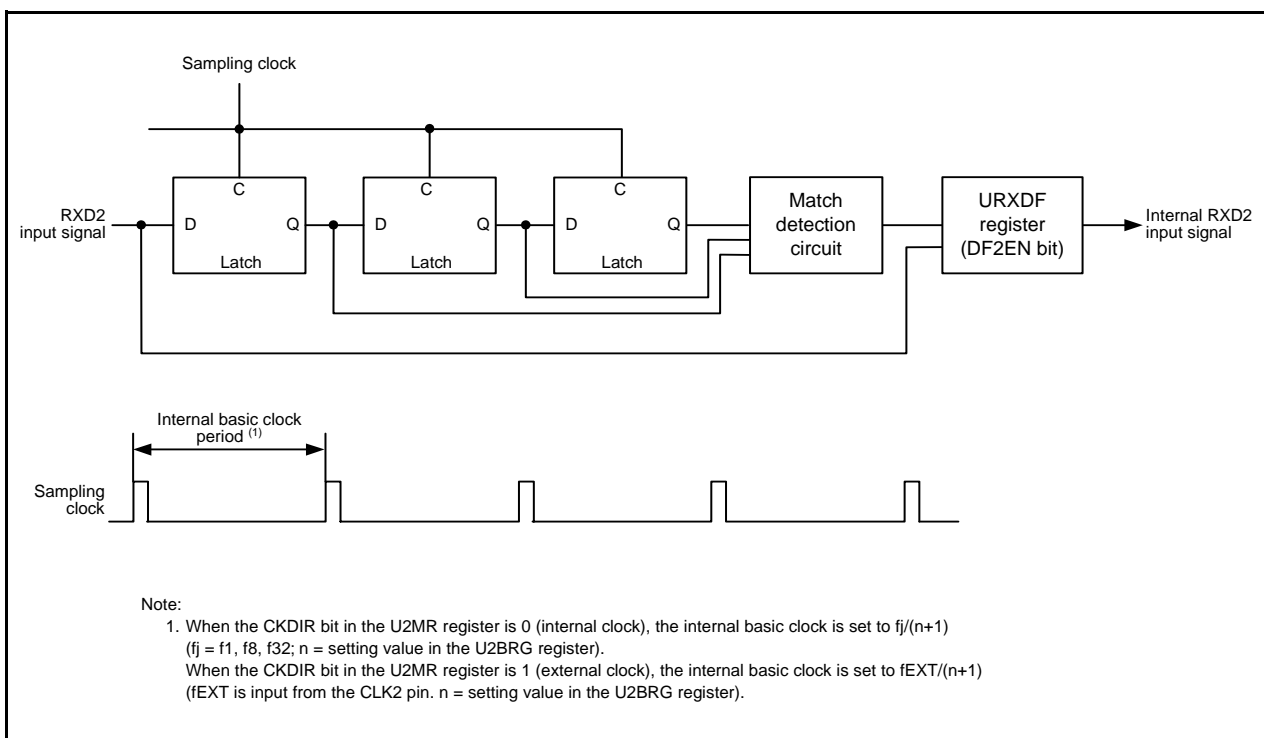

- The CRD bit = 0, CRS bit = 1 ( $\overline{\text{RTS}}$  function selected)

The  $\overline{\text{CTS2}}/\overline{\text{RTS2}}$  pin operates as the  $\overline{\text{RTS}}$  function.

### 21.4.7 RXD2 Digital Filter Select Function

When the DF2EN bit in the URXDF register is set to 1 (RXD2 digital filter enabled), the RXD2 input signal is loaded internally via the digital filter circuit for noise reduction. The noise canceller consists of three cascaded latch circuits and a match detection circuit. The RXD2 input signal is sampled on the internal basic clock with a frequency 16 times the bit rate. It is recognized as a signal and the level is passed forward to the next circuit when three latch outputs match. When the outputs do not match, the previous value is retained.

In other words, when the level is changed within three clocks, the change is recognized as not a signal but noise. Figure 21.12 shows a Block Diagram of RXD2 Digital Filter Circuit.

**Figure 21.12 Block Diagram of RXD2 Digital Filter Circuit**

## 21.5 Special Mode 1 (I<sup>2</sup>C Mode)

I<sup>2</sup>C mode is provided for use as a simplified I<sup>2</sup>C interface compatible mode. Table 21.9 lists the I<sup>2</sup>C Mode Specifications. Tables 21.10 and 21.11 list the registers used in I<sup>2</sup>C mode and the settings. Table 21.12 lists the I<sup>2</sup>C Mode Functions, Figure 21.13 shows an I<sup>2</sup>C Mode Block Diagram, and Figure 21.14 shows the Transfer to U2RB Register and Interrupt Timing.

As shown in Table 21.12, the MCU is placed in I<sup>2</sup>C mode by setting bits SMD2 to SMD0 to 010b and the IICM bit to 1. Because SDA2 transmit output has a delay circuit attached, SDA2 output does not change state until SCL2 goes low and remains stably low.

**Table 21.9 I<sup>2</sup>C Mode Specifications**

Item	Specification
Transfer data format	Transfer data length: 8 bits
Transfer clock	<ul style="list-style-type: none"> <li>• Master mode The CKDIR bit in the U2MR register is set to 0 (internal clock): <math>f_j/(2(n+1))</math> <math>f_j = f_1, f_8, f_{32}</math> <math>n =</math> setting value in the U2BRG register: 00h to FFh</li> <li>• Slave mode The CKDIR bit is set to 1 (external clock): Input from the SCL2 pin</li> </ul>
Transmit start conditions	To start transmission, the following requirements must be met: <sup>(1)</sup> <ul style="list-style-type: none"> <li>• The TE bit in the U2C1 register is set to 1 (transmission enabled).</li> <li>• The TI bit in the U2C1 register is set to 0 (data present in the U2TB register).</li> </ul>
Receive start conditions	To start reception, the following requirements must be met: <sup>(1)</sup> <ul style="list-style-type: none"> <li>• The RE bit in the U2C1 register is set to 1 (reception enabled).</li> <li>• The TE bit in the U2C1 register is set to 1 (transmission enabled).</li> <li>• The TI bit in the U2C1 register is set to 0 (data present in the U2TB register).</li> </ul>
Interrupt request generation timing	Start/stop condition detection, no acknowledgement detection, or acknowledgement detection
Error detection	Overrun error <sup>(2)</sup> This error occurs if the serial interface starts receiving the next unit of data before reading the U2RB register and receives the 8th bit of the next unit of data.
Selectable functions	<ul style="list-style-type: none"> <li>• SDA2 digital delay No digital delay or a delay of 2 to 8 U2BRG count source clock cycles can be selected.</li> <li>• Clock phase setting With or without clock delay can be selected.</li> </ul>

Notes:

1. When an external clock is selected, the requirements must be met while the external clock is held high.
2. If an overrun error occurs, the received data in the U2RB register will be undefined. The IR bit in the S2RIC register remains unchanged.

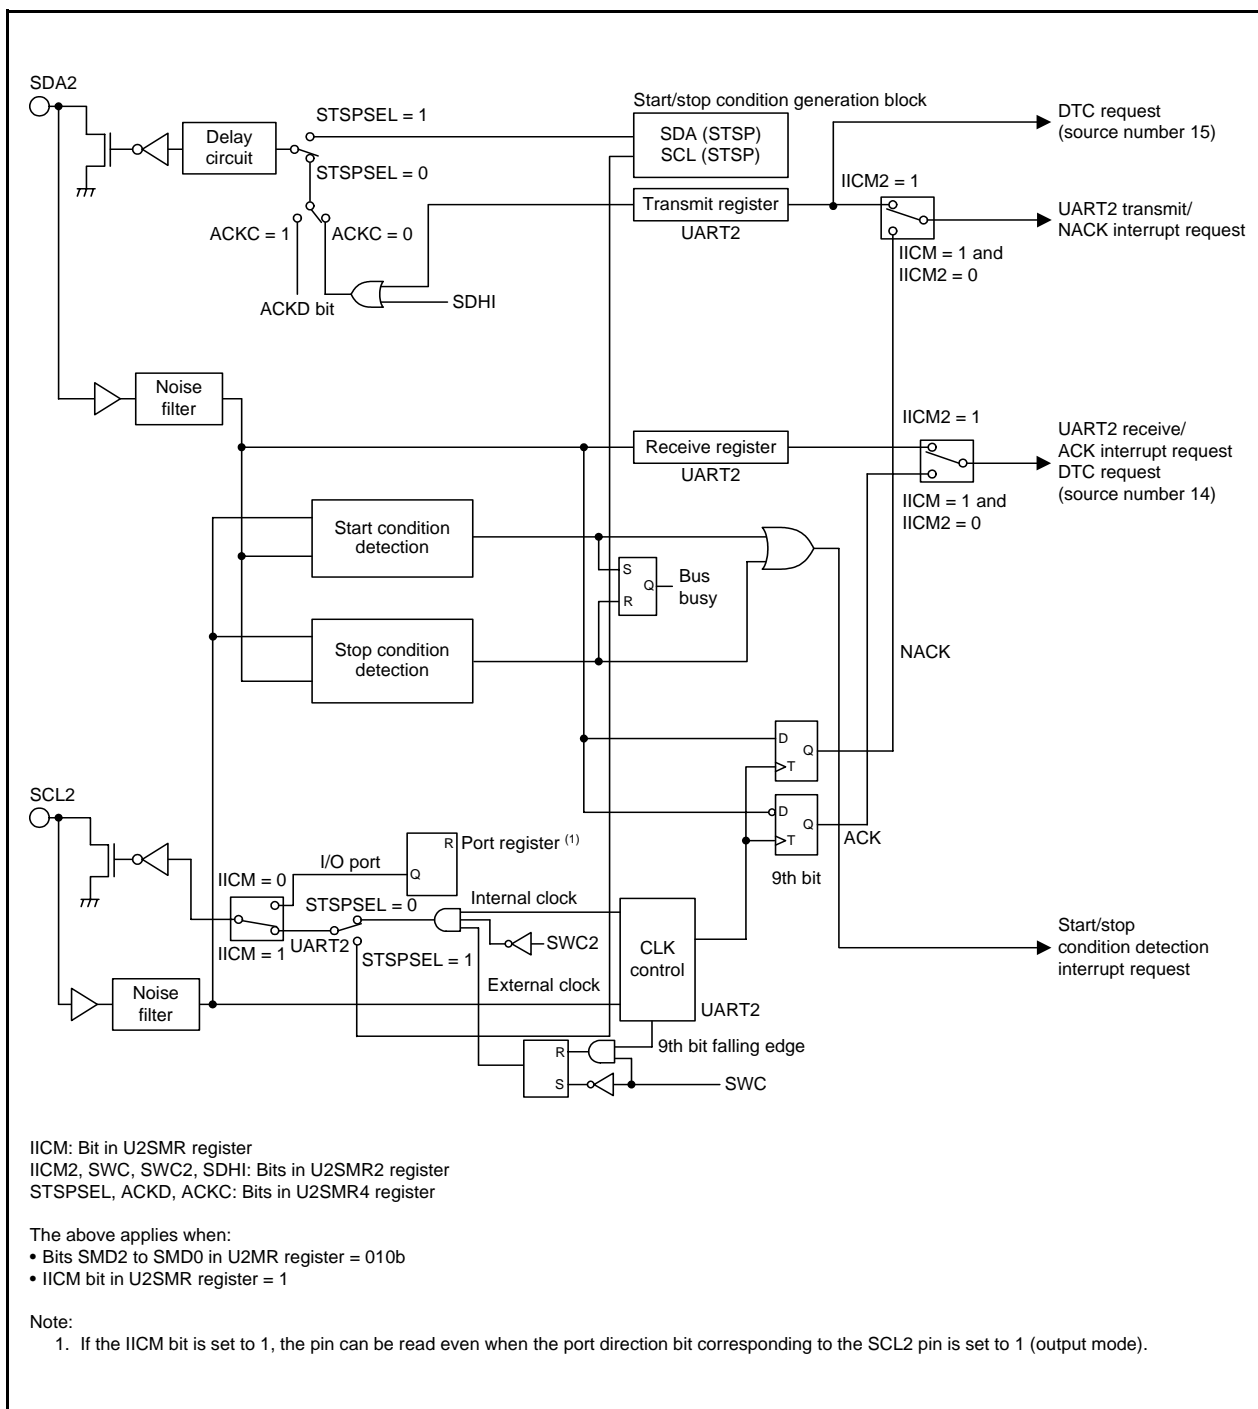

Figure 21.13 I2C Mode Block Diagram

**Table 21.10 Registers Used and Settings in I<sup>2</sup>C Mode (1)**

Register	Bit	Function	
		Master	Slave
U2TB (1)	b0 to b7	Set transmit data.	Set transmit data.
U2RB (1)	b0 to b7	Receive data can be read.	Receive data can be read.
	b8	ACK or NACK is set in this bit.	ACK or NACK is set in this bit.
	OER	Overrun error flag	Overrun error flag
U2BRG	b0 to b7	Set a bit rate.	Disabled
U2MR (1)	SMD2 to SMD0	Set to 010b.	Set to 010b.
	CKDIR	Set to 0.	Set to 1.
	IOPOL	Set to 0.	Set to 0.
U2C0	CLK1, CLK0	Select the count source for the U2BRG register.	Disabled
	CRS	Disabled because CRD = 1.	Disabled because CRD = 1.
	TXEPT	Transmit register empty flag	Transmit register empty flag
	CRD	Set to 1.	Set to 1.
	NCH	Set to 1.	Set to 1.
	CKPOL	Set to 0.	Set to 0.
	UFORM	Set to 1.	Set to 1.
U2C1	TE	Set to 1 to enable transmission.	Set to 1 to enable transmission.
	TI	Transmit buffer empty flag	Transmit buffer empty flag
	RE	Set to 1 to enable reception.	Set to 1 to enable reception.
	RI	Receive complete flag	Receive complete flag
	U2IRS	Set to 1.	Set to 1.
	U2RRM, U2LCH, U2ERE	Set to 0.	Set to 0.
U2SMR	IICM	Set to 1.	Set to 1.
	BBS	Bus busy flag	Bus busy flag
	b3 to b7	Set to 0.	Set to 0.
U2SMR2	IICM2	Refer to <b>Table 21.12 I<sup>2</sup>C Mode Functions.</b>	Refer to <b>Table 21.12 I<sup>2</sup>C Mode Functions.</b>
	CSC	Set to 1 to enable clock synchronization.	Set to 0.
	SWC	Set to 1 to fix SCL2 output low at the falling edge of the 9th bit of clock.	Set to 1 to fix SCL2 output low at the falling edge of the 9th bit of clock.
	STAC	Set to 0.	Set to 1 to initialize UART2 at start condition detection
	SWC2	Set to 1 to forcibly pull SCL2 low.	Set to 1 to forcibly pull SCL2 output low.
	SDHI	Set to 1 to disable SDA2 output.	Set to 1 to disable SDA2 output.
	b7	Set to 0.	Set to 0.
	b0, b2, b4, and NODC	Set to 0.	Set to 0.
U2SMR3	CKPH	Refer to <b>Table 21.12 I<sup>2</sup>C Mode Functions.</b>	Refer to <b>Table 21.12 I<sup>2</sup>C Mode Functions.</b>
	DL2 to DL0	Set the amount of SDA2 digital delay.	Set the amount of SDA2 digital delay.

Note:

1. Set the bits not listed in this table to 0 when writing to the above registers in I<sup>2</sup>C mode.

**Table 21.11 Registers Used and Settings in I<sup>2</sup>C Mode (2)**

Register	Bit	Function	
		Master	Slave
U2SMR4	STAREQ	Set to 1 to generate a start condition.	Set to 0.
	RSTAREQ	Set to 1 to generate a restart condition.	Set to 0.
	STPREQ	Set to 1 to generate a stop condition.	Set to 0.
	STSPSEL	Set to 1 to output each condition.	Set to 0.
	ACKD	Select ACK or NACK.	Select ACK or NACK.
	ACKC	Set to 1 to output ACK data.	Set to 1 to output ACK data.
	SCLHI	Set to 1 to stop SCL2 output when a stop condition is detected.	Set to 0.
	SWC9	Set to 0.	Set to 1 to hold SCL2 low at the falling edge of the 9th bit of clock.
URXDF	DF2EN	Set to 0.	Set to 0.
U2SMR5	MP	Set to 0.	Set to 0.

Table 21.12 I<sup>2</sup>C Mode Functions

Function	Clock Synchronous Serial I/O Mode (SMD2 to SMD0 = 001b, IICM = 0)	I <sup>2</sup> C Mode (SMD2 to SMD0 = 010b, IICM = 1)			
		IICM2 = 0 (NACK/ACK interrupt)		IICM2 = 1 (UART transmit/receive interrupt)	
		CKPH = 0 (No Clock Delay)	CKPH = 1 (With Clock Delay)	CKPH = 0 (No Clock Delay)	CKPH = 1 (With Clock Delay)
Source of UART2 bus collision interrupt <sup>(1, 5)</sup>	—	Start condition detection or stop condition detection (Refer to <b>Table 21.13 STSPSEL Bit Functions</b> )			
Source of UART2 transmit/NACK2 <sup>(1, 6)</sup>	UART2 transmission Transmission started or completed (selectable by U2IRS bit)	No acknowledgment detection (NACK) Rising edge of SCL2 9th bit		UART2 transmission Rising edge of SCL2 9th bit	UART2 transmission Falling edge of SCL2 next to 9th bit
Source of UART2 receive/ACK2 <sup>(1, 6)</sup>	UART2 reception When 8th bit received CKPOL = 0 (rising edge) CKPOL = 1 (falling edge)	Acknowledgment detection (ACK) Rising edge of SCL2 9th bit		UART2 reception Falling edge of SCL2 9th bit	
Timing for transferring data from UART reception shift register to U2RB register	CKPOL = 0 (rising edge) CKPOL = 1 (falling edge)	Rising edge of SCL2 9th bit		Falling edge of SCL2 9th bit	Falling and rising edges of SCL2 9th bit
UART2 transmission output delay	No delay	With delay			
TXD2/SDA2 functions	TXD2 output	SDA2 I/O			
RXD2/SCL2 functions	RXD2 input	SCL2 I/O			
CLK2 functions	CLK2 input or output port selected	— (Cannot be used in I <sup>2</sup> C mode.)			
Noise filter width	15 ns	200 ns			
Read of RXD2 and SCL2 pin levels	Possible when the corresponding port direction bit = 0	Possible regardless of the content of the corresponding port direction bit.			
Initial value of TXD2 and SDA2 outputs	CKPOL = 0 (“H”) CKPOL = 1 (“L”)	The value set in the port register before setting I <sup>2</sup> C mode. <sup>(2)</sup>			
Initial and end values of SCL2	—	“H”	“L”	“H”	“L”
DTC source number 14 <sup>(6)</sup>	UART2 reception When 8th bit received CKPOL = 0 (rising edge) CKPOL = 1 (falling edge)	Acknowledgment detection (ACK)		UART2 reception Falling edge of SCL2 9th bit	
DTC source number 15 <sup>(6)</sup>	UART2 transmission Transmission started or completed (selectable by U2IRS bit)	UART2 transmission Rising edge of SCL2 9th bit	UART2 transmission Falling edge of SCL2 next to 9th bit	UART2 transmission Rising edge of SCL2 9th bit	UART2 transmission Falling edge of SCL2 next to 9th bit
Storage of receive data	1st to 8th bits of the received data are stored in bits b0 to b7 in the U2RB register.	1st to 8th bits of the received data are stored in bits b7 to b0 in the U2RB register.		1st to 7th bits of the received data are stored in bits b6 to b0 in the U2RB register. 8th bit is stored in bit b8 in the U2RB register.	
Read of receive data	The U2RB register status is read.			1st to 8th bits are stored in bits b7 to b0 in the U2RB register. <sup>(3)</sup> Bits b6 to b0 in the U2RB register are read as bits b7 to b1. Bit b8 in the U2RB register is read as bit b0. <sup>(4)</sup>	

## Notes:

- If the source of any interrupt is changed, the IR bit in the interrupt control register for the changed interrupt may inadvertently be set to 1 (interrupt requested). (Refer to **11.9 Notes on Interrupts**.)  
If one of the bits listed below is changed, the interrupt source, the interrupt timing, and others change. Therefore, always be sure to set the IR bit to 0 (interrupt not requested) after changing these bits.  
Bits SMD2 to SMD0 in the U2MR register, the IICM bit in the U2SMR register, the IICM2 bit in the U2SMR2 register, and the CKPH bit in the U2SMR3 register.
- Set the initial value of SDA2 output while bits SMD2 to SMD0 in the U2MR register are 000b (serial interface disabled).
- Second data transfer to the U2RB register (rising edge of SCL2 9th bit)
- First data transfer to the U2RB register (falling edge of SCL2 9th bit)
- Refer to **Figure 21.16 STSPSEL Bit Functions**.
- Refer to **Figure 21.14 Transfer to U2RB Register and Interrupt Timing**.

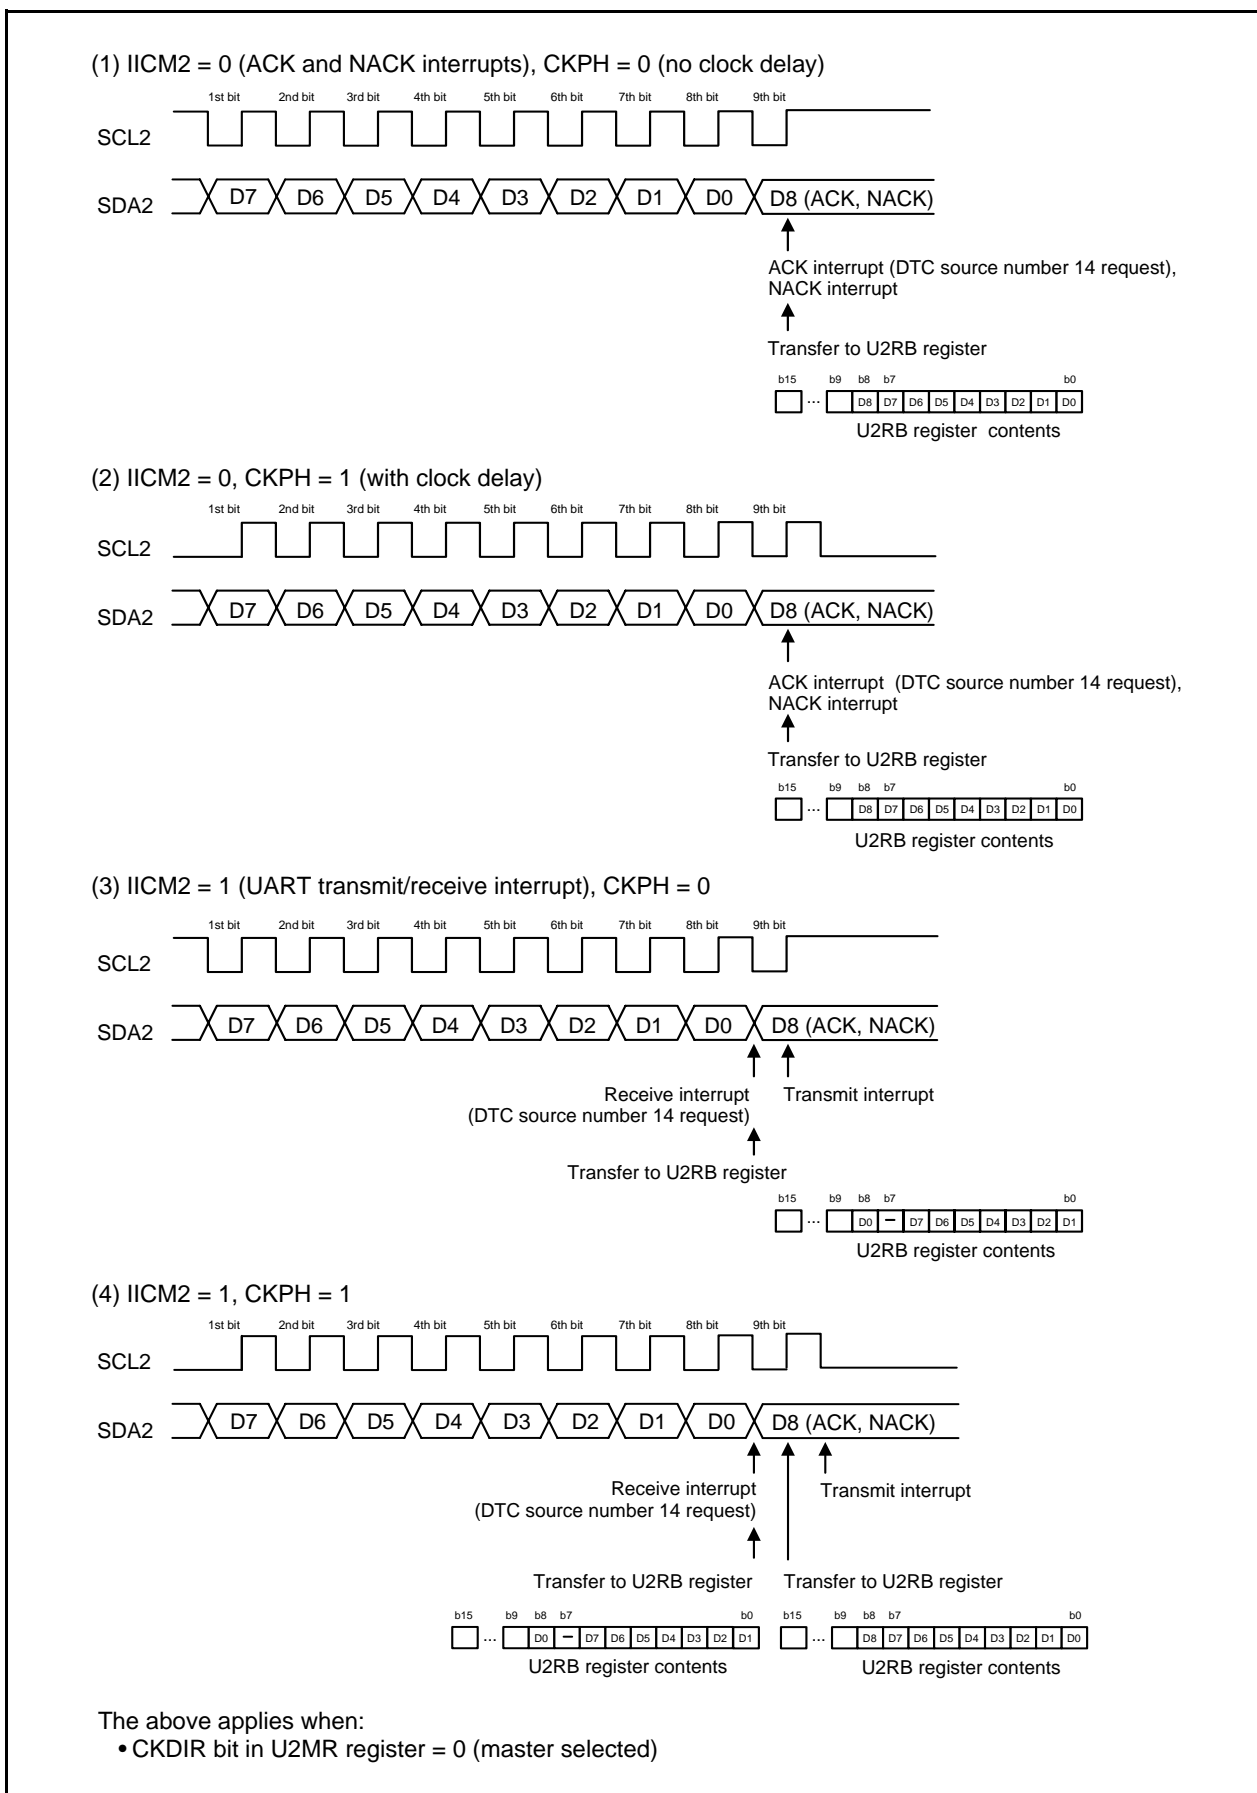

Figure 21.14 Transfer to U2RB Register and Interrupt Timing

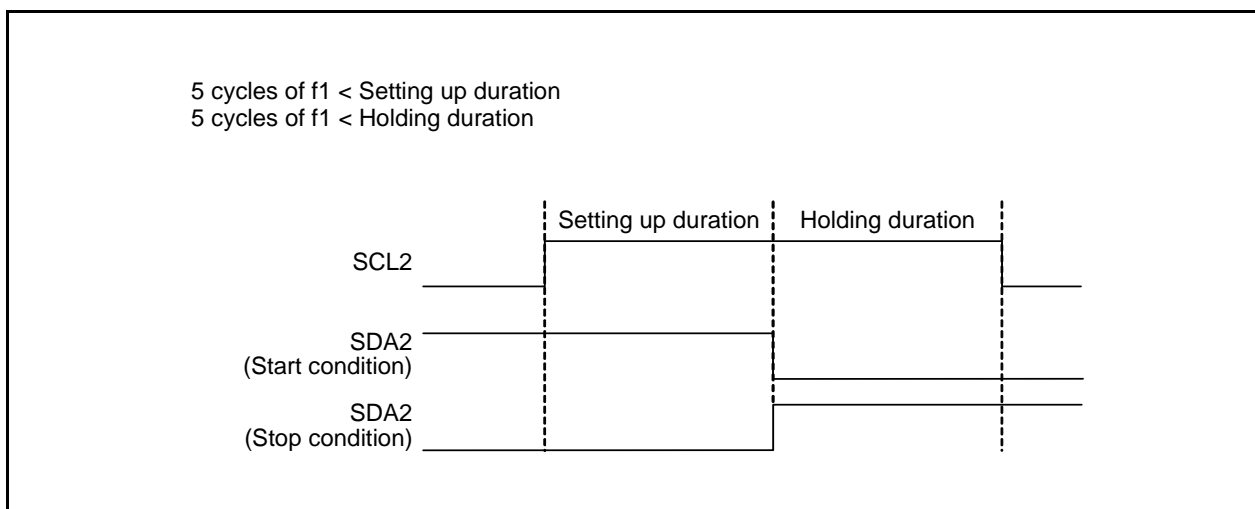

### 21.5.1 Detection of Start and Stop Conditions

Whether a start or a stop condition has been detected is determined.

A start condition detect interrupt request is generated when the SDA2 pin changes state from high to low while the SCL2 pin is in the high state. A stop condition detect interrupt request is generated when the SDA2 pin changes state from low to high while the SCL2 pin is in the high state.

Because the start and stop condition detect interrupts share an interrupt control register and vector, check the BBS bit in the U2SMR register to determine which interrupt source is requesting the interrupt.

Figure 21.15 shows the Detection of Start and Stop Conditions.

**Figure 21.15 Detection of Start and Stop Conditions**

### 21.5.2 Output of Start and Stop Conditions

A start condition is generated by setting the STAREQ bit in the U2SMR4 register to 1 (start).

A restart condition is generated by setting the RSTAREQ bit in the U2SMR4 register to 1 (start).

A stop condition is generated by setting the STPREQ bit in the U2SMR4 register to 1 (start).

The output procedure is as follows:

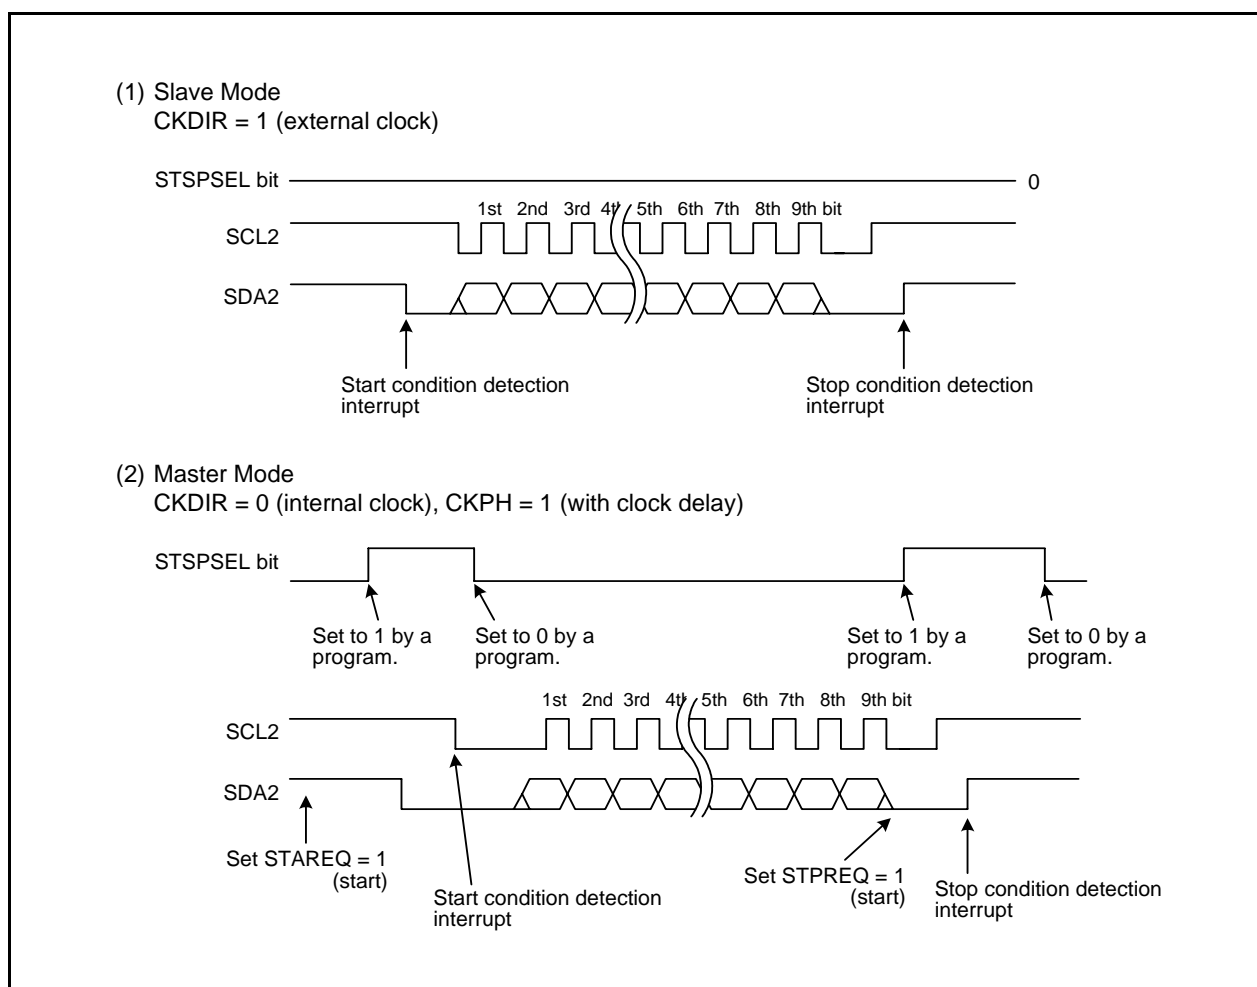

(1) Set the STAREQ bit, RSTAREQ bit or STPREQ bit to 1 (start).

(2) Set the STSPSEL bit in the U2SMR4 register to 1 (output).

Table 21.13 lists the STSPSEL Bit Functions. Figure 21.16 shows the STSPSEL Bit Functions.

**Table 21.13 STSPSEL Bit Functions**

Function	STSPSEL = 0	STSPSEL = 1
Output of pins SCL2 and SDA2	Output of transfer clock and data Output of start/stop conditions is accomplished by a program using ports (not automatically generated in hardware)	Output of start/stop conditions according to bits STAREQ, RSTAREQ, and STPREQ
Start/stop condition interrupt request generation timing	Detection of start/stop conditions	Completion of start/stop condition generation

**Figure 21.16 STSPSEL Bit Functions**

### 21.5.3 Transfer Clock

The transfer clock is used to transmit and receive data as is shown in **Figure 21.14 Transfer to U2RB Register and Interrupt Timing**.

The CSC bit in the U2SMR2 register is used to synchronize an internally generated clock (internal SCL2) and an external clock supplied to the SCL2 pin. When the CSC bit is set to 1 (clock synchronization enabled), if a falling edge on the SCL2 pin is detected while the internal SCL2 is high, the internal SCL2 goes low. The value in the U2BRG register is reloaded and counting of the low-level intervals starts. If the internal SCL2 changes state from low to high while the SCL2 pin is low, counting stops. If the SCL2 pin goes high, counting restarts. In this way, the UART2 transfer clock is equivalent to AND of the internal SCL2 and the clock signal applied to the SCL2 pin. The transfer clock works from a half cycle before the falling edge of the internal SCL2 1st bit to the rising edge of the 9th bit. To use this function, select an internal clock for the transfer clock.

The SWC bit in the U2SMR2 register determines whether the SCL2 pin is fixed low or freed from low-level output at the falling edge of the 9th clock pulse.

If the SCLHI bit in the U2SMR4 register is set to 1 (enabled), SCL2 output is turned off (placed in the high-impedance state) when a stop condition is detected.

Setting the SWC2 bit in the U2SMR2 register to 1 ("L" output) makes it possible to forcibly output a low-level signal from the SCL2 pin even while sending or receiving data. Setting the SWC2 bit to 0 (transfer clock) allows the transfer clock to be output from or supplied to the SCL2 pin, instead of outputting a low-level signal.

If the SWC9 bit in the U2SMR4 register is set to 1 (SCL "L" hold enabled) when the CKPH bit in the U2SMR3 register is 1, the SCL2 pin is fixed low at the falling edge of the clock pulse next to the 9th. Setting the SWC9 bit to 0 (SCL "L" hold disabled) frees the SCL2 pin from low-level output.

### 21.5.4 SDA Output

The data written to bits b7 to b0 (D7 to D0) in the U2TB register is output in descending order from D7.

The 9th bit (D8) is ACK or NACK.

Set the initial value of SDA2 transmit output when IICM is set to 1 (I<sup>2</sup>C mode) and bits SMD2 to SMD0 in the U2MR register are set to 000b (serial interface disabled).

Bits DL2 to DL0 in the U2SMR3 register allow addition of no delays or a delay of 2 to 8 U2BRG count source clock cycles to the SDA2 output.

Setting the SDHI bit in the U2SMR2 register to 1 (SDA output disabled) forcibly places the SDA2 pin in the high-impedance state. Do not write to the SDHI bit at the rising edge of the UART2 transfer clock.

### 21.5.5 SDA Input

When the IICM2 bit is set to 0, the 1st to 8th bits (D7 to D0) of received data are stored in bits b7 to b0 in the U2RB register. The 9th bit (D8) is ACK or NACK.

When the IICM2 bit is set to 1, the 1st to 7th bits (D7 to D1) of received data are stored in bits b6 to b0 in the U2RB register and the 8th bit (D0) is stored in bit b8 in the U2RB register. Even when the IICM2 bit is set to 1, if the CKPH bit is 1, the same data as when the IICM2 bit is 0 can be read by reading the U2RB register after the rising edge of 9th bit of the clock.

### 21.5.6 ACK and NACK

If the STSPSEL bit in the U2SMR4 register is set to 0 (start and stop conditions not output) and the ACKC bit in the U2SMR4 register is set to 1 (ACK data output), the value of the ACKD bit in the U2SMR4 register is output from the SDA2 pin.

If the IICM2 bit is set to 0, a NACK interrupt request is generated if the SDA2 pin remains high at the rising edge of the 9th bit of transmit clock pulse. An ACK interrupt request is generated if the SDA2 pin is low at the rising edge of the 9th bit of the transmit clock.

If ACK2 (UART2 reception) is selected to generate a DTC request source, a DTC transfer can be activated by detection of an acknowledge.

### 21.5.7 Initialization of Transmission/Reception

If a start condition is detected while the STAC bit is set to 1 (UART2 initialization enabled), the serial interface operates as described below.

- The transmit shift register is initialized, and the contents of the U2TB register are transferred to the transmit shift register. In this way, the serial interface starts sending data when the next clock pulse is applied. However, the UART2 output value does not change state and remains the same as when a start condition was detected until the first bit of data is output in synchronization with the input clock.
- The receive shift register is initialized, and the serial interface starts receiving data when the next clock pulse is applied.
- The SWC bit is set to 1 (SCL wait output enabled). Consequently, the SCL2 pin is pulled low at the falling edge of the 9th clock pulse.

Note that when UART2 transmission/reception is started using this function, the TI bit does not change state. Select the external clock as the transfer clock to start UART2 transmission/reception with this setting.

## 21.6 Special Mode 2 (SSU Mode)

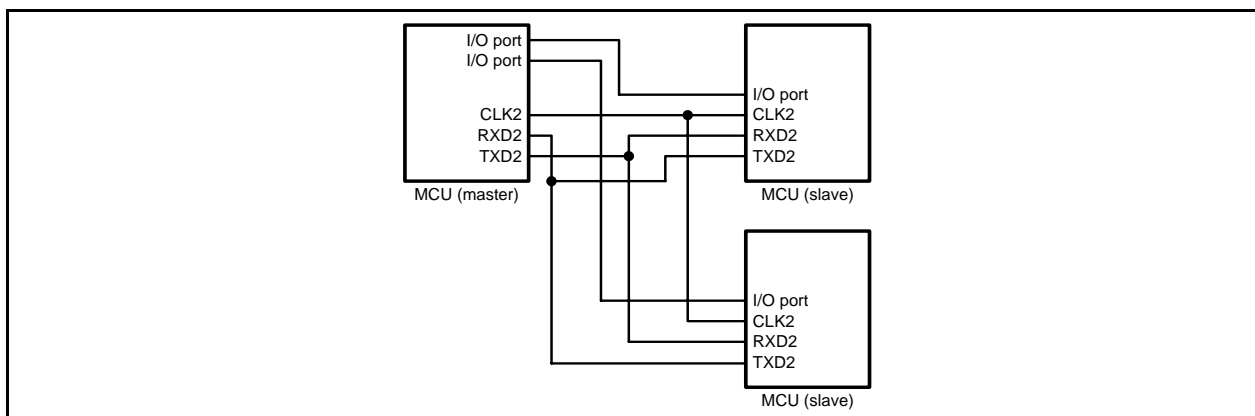

In special mode 2, serial communication can be performed between one master device and multiple slave devices. The transfer clock polarity and phase can be selected. Table 21.14 lists the Special Mode 2 Specifications. Table 21.15 lists the Registers Used and Settings in Special Mode 2. Figure 21.17 shows the Communication Control Example (UART2) in Special Mode 2.

**Table 21.14 Special Mode 2 Specifications**

Item	Specification
Transfer data format	Transfer data length: 8 bits
Transfer clock	<ul style="list-style-type: none"> <li>Master mode The CKDIR bit in the U2MR register is set to 0 (internal clock): <math>f_j/(2(n+1))</math> <math>f_j = f_1, f_2, f_8, f_{32}</math>    <math>n =</math> setting value in the U2BRG register: 00h to FFh</li> <li>Slave mode The CKDIR bit is set to 1 (external clock selected): Input from the CLK2 pin</li> </ul>
Transmit/receive control	Controlled by I/O ports
Transmit start conditions	To start transmission, the following requirements must be met: <sup>(1)</sup> <ul style="list-style-type: none"> <li>The TE bit in the U2C1 register is set to 1 (transmission enabled).</li> <li>The TI bit in the U2C1 register is set to 0 (data present in the U2TB register).</li> </ul>
Receive start conditions	To start reception, the following requirements must be met: <sup>(1)</sup> <ul style="list-style-type: none"> <li>The RE bit in the U2C1 register is set to 1 (reception enabled).</li> <li>The TE bit in the U2C1 register is set to 1 (transmission enabled).</li> <li>The TI bit in the U2C1 register is set to 0 (data present in the U2TB register).</li> </ul>
Interrupt request generation timing	For transmission, one of the following conditions can be selected. <ul style="list-style-type: none"> <li>The U2IRS bit in the U2C1 register is set to 0 (transmit buffer empty): When data is transferred from the U2TB register to the UART2 transmit register (at start of transmission).</li> <li>The U2IRS bit is set to 1 (transmission completed): When data transmission from the UART2 transmit register is completed.</li> </ul> For reception <ul style="list-style-type: none"> <li>When data is transferred from the UART2 receive register to the U2RB register (at completion of reception).</li> </ul>
Error detection	Overrun error <sup>(2)</sup> This error occurs if the serial interface starts receiving the next unit of data before reading the U2RB register and receives the 7th bit of the next unit of data.
Selectable function	Clock phase setting Four combinations of transfer clock polarities and phases can be selected.

Notes:

- When an external clock is selected, the requirements must be met in either of the following states: the external clock is held high when the CKPOL bit in the U2C0 register is set to 0 (transmit data output at the falling edge and receive data input at the rising edge of the transfer clock); the external clock is held low when the CKPOL bit is set to 1 (transmit data output at the rising edge and receive data input at the falling edge of the transfer clock).
- If an overrun error occurs, the received data in the U2RB register will be undefined. The IR bit in the S2RIC register remains unchanged.

**Figure 21.17 Communication Control Example (UART2) in Special Mode 2**

**Table 21.15 Registers Used and Settings in Special Mode 2**

Register	Bit	Function
U2TB (1)	b0 to b7	Set transmit data.
U2RB (1)	b0 to b7	Receive data can be read.
	OER	Overrun error flag
U2BRG	b0 to b7	Set a bit rate.
U2MR (1)	SMD2 to SMD0	Set to 001b.
	CKDIR	Set to 0 in master mode or 1 in slave mode.
	IOPOL	Set to 0.
U2C0	CLK0, CLK1	Select the count source for the U2BRG register.
	CRS	Disabled because CRD = 1.
	TXEPT	Transmit register empty flag
	CRD	Set to 1.
	NCH	Select TXD2 pin output mode.
	CKPOL	Clock phases can be set in combination with the CKPH bit in the U2SMR3 register.
	UFORM	Set to 0.
U2C1	TE	Set to 1 to enable transmission/reception.
	TI	Transmit buffer empty flag
	RE	Set to 1 to enable reception.
	RI	Receive complete flag
	U2IRS	Select the UART2 transmit interrupt source.
	U2RRM, U2LCH, U2ERE	Set to 0.
U2SMR	b0 to b7	Set to 0.
U2SMR2	b0 to b7	Set to 0.
U2SMR3	CKPH	Clock phases can be set in combination with the CKPOL bit in the U2C0 register.
	NODC	Set to 0.
	b0, b2, b4 to b7	Set to 0.
U2SMR4	b0 to b7	Set to 0.
URXDF	DF2EN	Select the digital filter disabled or enabled.
U2SMR5	MP	Set to 0.

Note:

1. Set the bits not listed in this table to 0 when writing to the above registers in special mode 2.

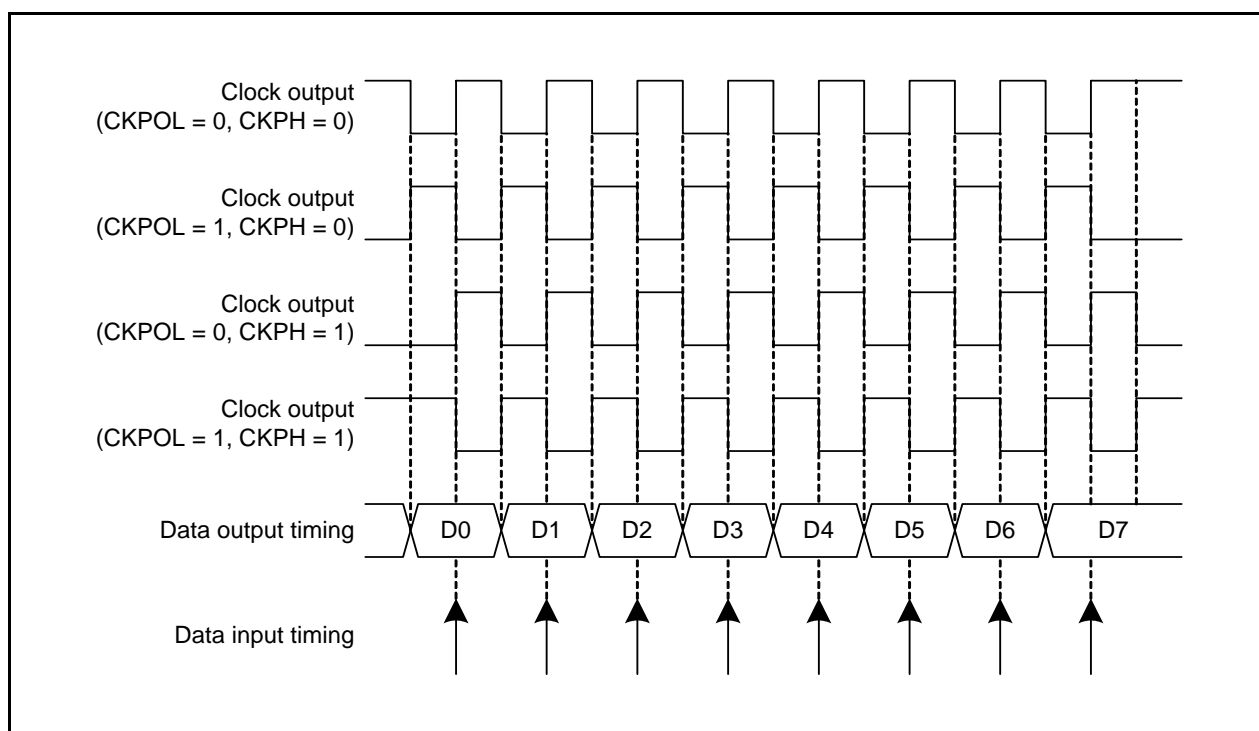

### 21.6.1 Clock Phase Setting Function

One of four combinations of transfer clock phases and polarities can be selected using the CKPH bit in the U2SMR3 register and the CKPOL bit in the U2C0 register.

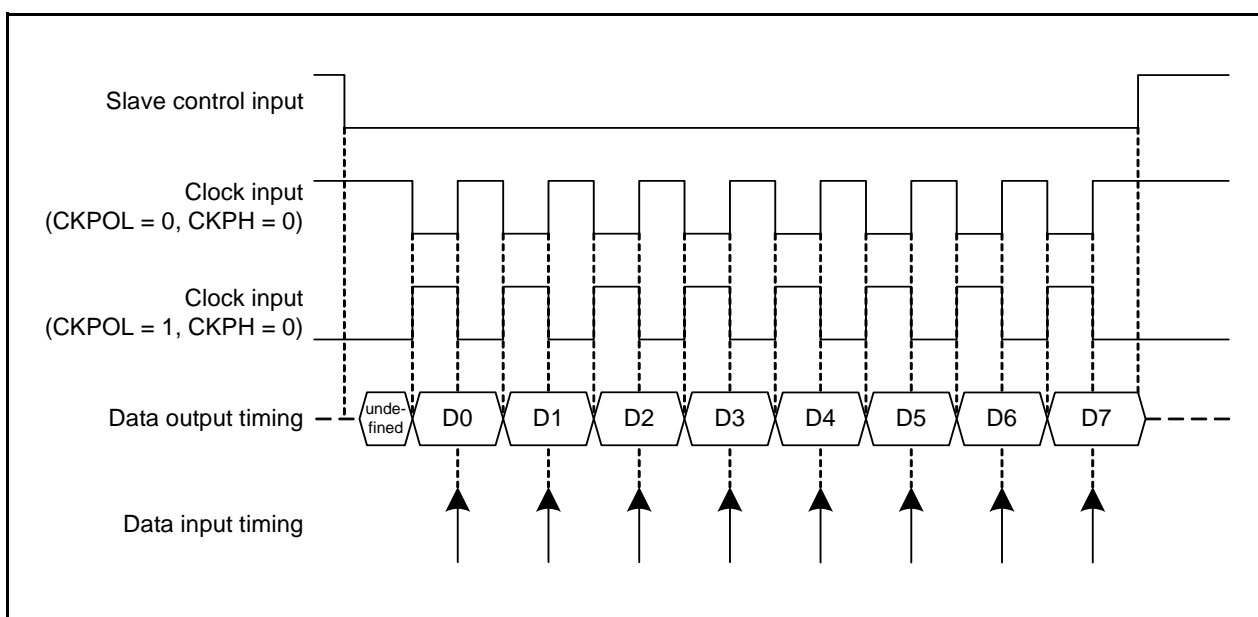

Make sure the transfer clock polarity and phase are the same for the master and slave devices to be used for communication.

Figure 21.18 shows the Transmit and Receive Timing in Master Mode (Internal Clock).

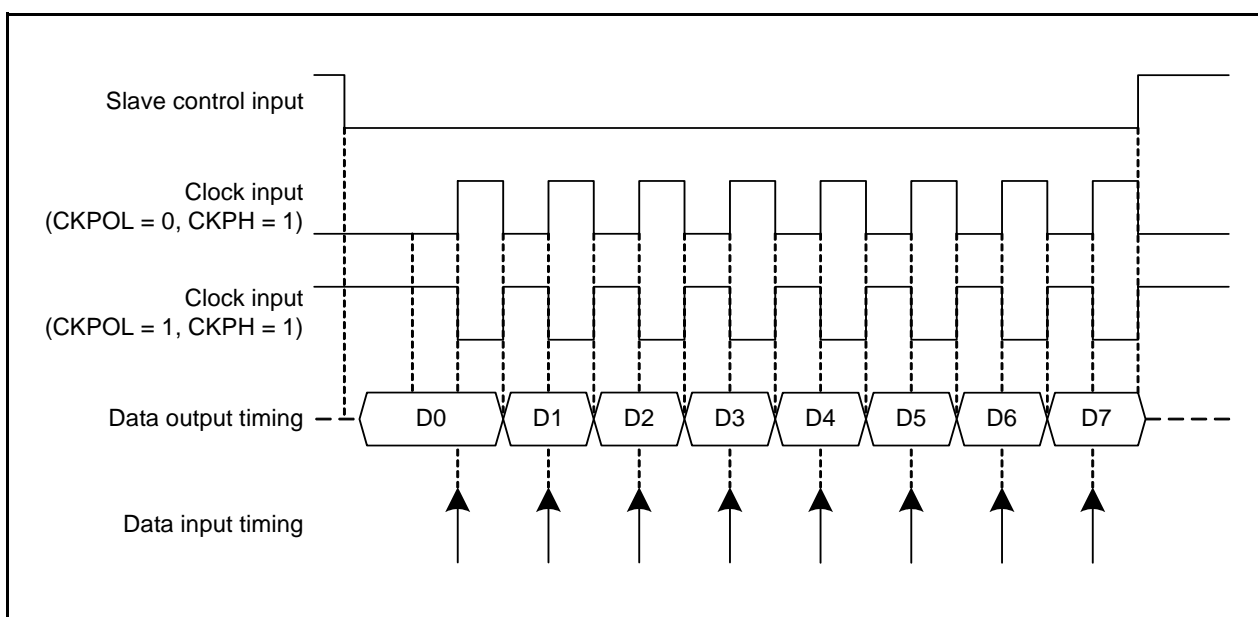

Figure 21.19 shows the Transmit and Receive Timing (CKPH = 0) in Slave Mode (External Clock) and Figure 21.20 shows the Transmit and Receive Timing (CKPH = 1) in Slave Mode (External Clock).

**Figure 21.18** Transmit and Receive Timing in Master Mode (Internal Clock)

**Figure 21.19 Transmit and Receive Timing (CKPH = 0) in Slave Mode (External Clock)**

**Figure 21.20 Transmit and Receive Timing (CKPH = 1) in Slave Mode (External Clock)**

## 21.7 Multiprocessor Communication Function

When the multiprocessor communication function is used, data transmission/reception can be performed between a number of processors sharing communication lines by asynchronous serial communication, in which a multiprocessor bit is added to the data. For multiprocessor communication, each receiving station is addressed by a unique ID code. The serial communication cycle consists of two component cycles; an ID transmission cycle for specifying the receiving station, and a data transmission cycle for the specified receiving station. The multiprocessor bit is used to differentiate between the ID transmission cycle and the data transmission cycle. When the multiprocessor bit is set to 1, the cycle is an ID transmission cycle; when the multiprocessor bit is set to 0, the cycle is a data transmission cycle. Figure 21.21 shows an Inter-Processor Communication Example Using Multiprocessor Format (Data AAh Transmission to Receiving Station A).

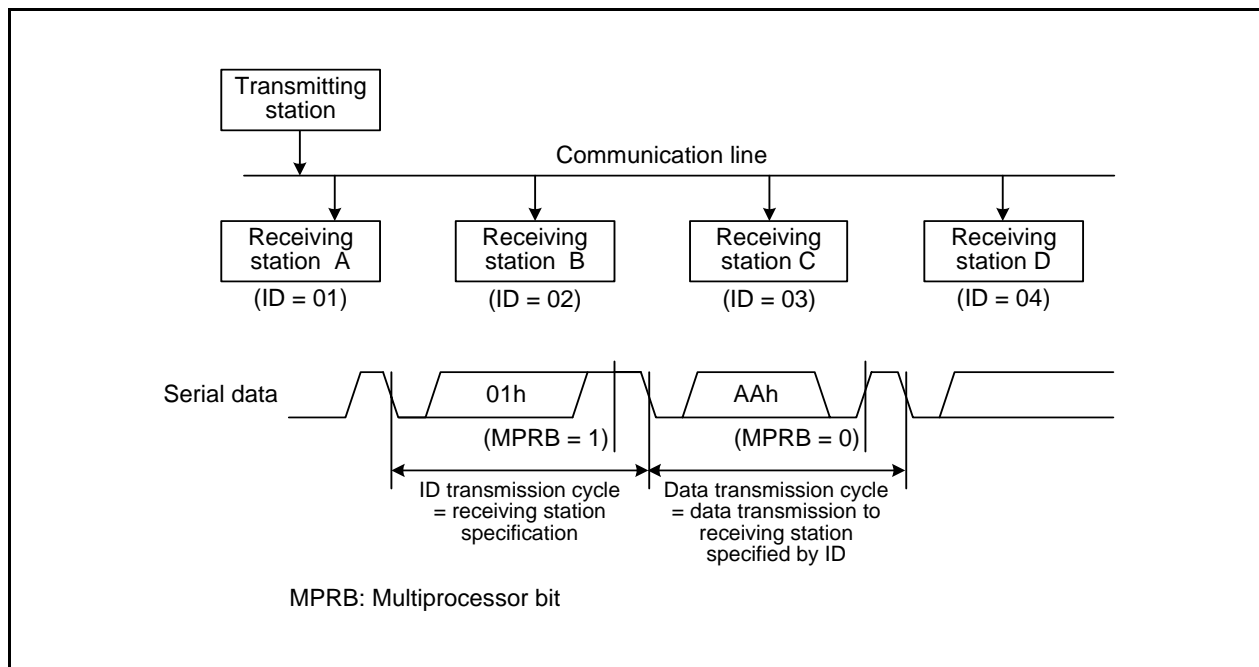

The transmitting station first sends the ID code of the receiving station to perform communication as communication data with a 1 multiprocessor bit added. It then sends transmit data as communication data with a 0 multiprocessor bit added.

When communication data in which the multiprocessor bit is 1 is received, the receiving station compares that data with its own ID. If they match, the data to be sent next is received. If they do not match, the receive station continues to skip communication data until data in which the multiprocessor bit is 1 is again received.

UART2 uses the MPIE bit in the U2SMR5 register to implement this function. When the MPIE bit is set to 1, data transfer from the UART2 receive register to the U2RB register, receive error detection, and the settings of the status flags, the RI bit in the U2C1 register, bits FER and OER in the U2RB register, are disabled until data in which the multiprocessor bit is 1 is received. On receiving a receive character in which the multiprocessor bit is 1, the MPRB bit in the U2RB register is set to 1 and the MPIE in the U2SMR5 register bit is set to 0, thus normal reception is resumed.

When the multiprocessor format is specified, the parity bit specification is invalid. All other bit settings are the same as those in normal asynchronous mode (UART mode). The clock used for multiprocessor communication is the same as that in normal asynchronous mode (UART mode).

Figure 21.22 shows a Block Diagram of Multiprocessor Communication Function. Table 21.16 lists the Registers and Settings in Multiprocessor Communication Function.

**Figure 21.21 Inter-Processor Communication Example Using Multiprocessor Format (Data AAh Transmission to Receiving Station A)**

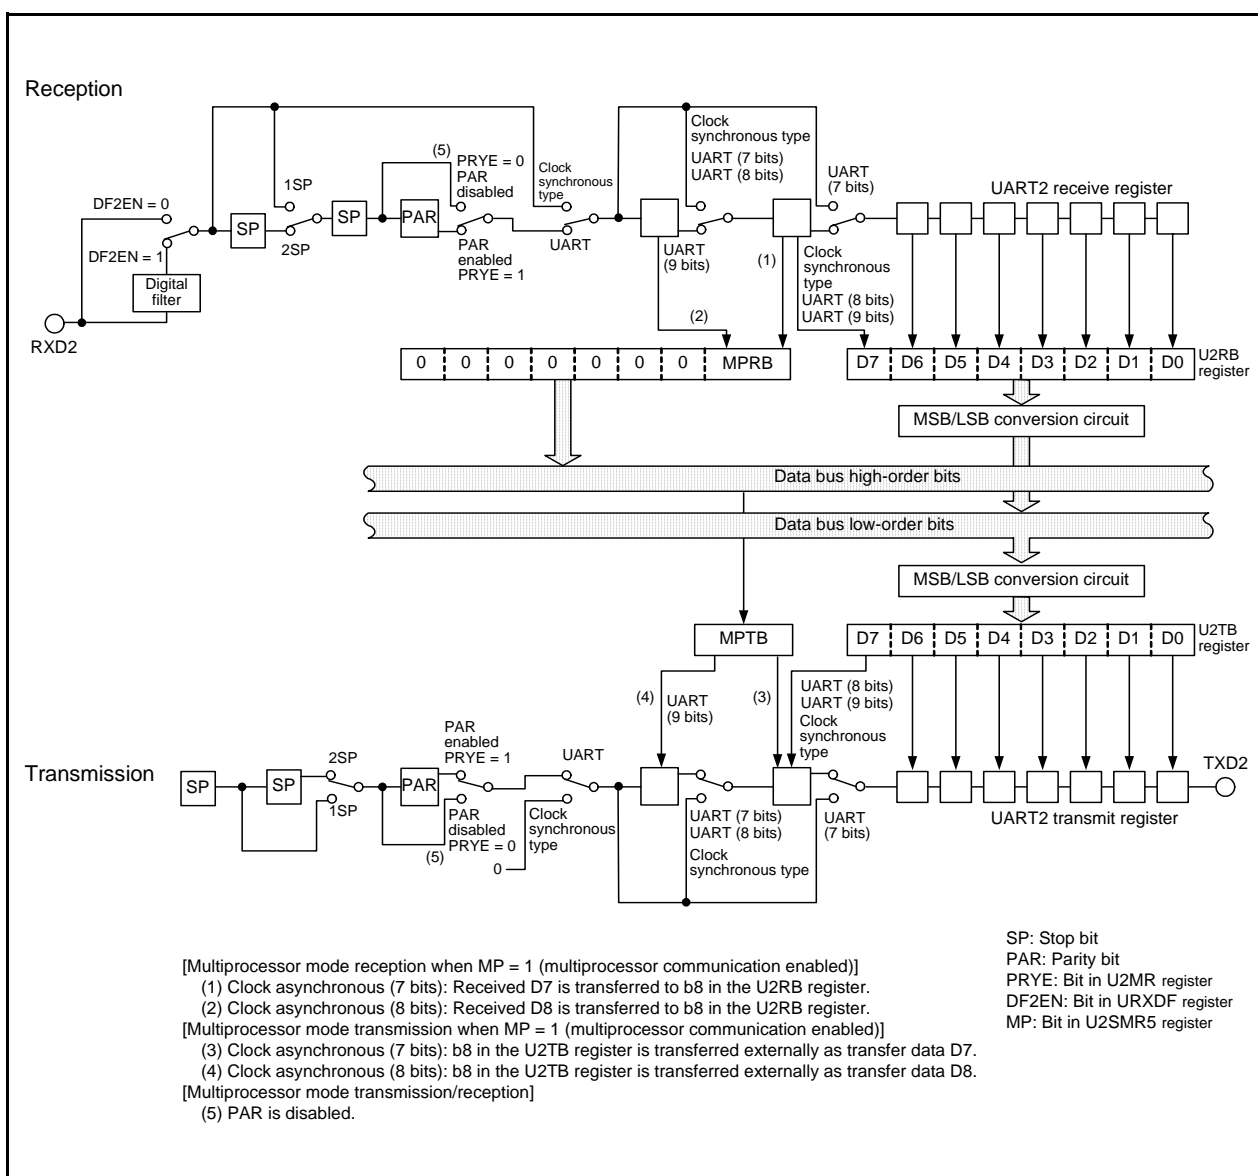

Figure 21.22 Block Diagram of Multiprocessor Communication Function

**Table 21.16 Registers and Settings in Multiprocessor Communication Function**

Register	Bit	Function
U2TB (1)	b0 to b7	Set transmit data.
	MPTB	Set to 0 or 1.
U2RB (2)	b0 to b7	Receive data can be read.
	MPRB	Multiprocessor bit
	OER, FER, SUM	Error flag
U2BRG	b0 to b7	Set the transfer rate.
U2MR	SMD2 to SMD0	Set to 100b when transfer data is 7 bits long.
		Set to 101b when transfer data is 8 bits long.
	CKDIR	Select the internal clock or external clock.
	STPS	Select the stop bit.
	PRY, PRYE	Parity detection function disabled
	IOPOL	Set to 0.
U2C0	CLK0, CLK1	Select the U2BRG count source.
	CRS	$\overline{\text{CTS}}$ or $\overline{\text{RTS}}$ function disabled
	TXEPT	Transmit register empty flag
	CRD	Set to 0.
	NCH	Select TXD2 pin output mode.
	CKPOL	Set to 0.
	UFORM	Set to 0.
U2C1	TE	Set to 1 to enable transmission.
	TI	Transmit buffer empty flag
	RE	Set to 1 to enable reception.
	RI	Receive complete flag
	U2IRS	Select the UART2 transmit interrupt source.
	U2LCH	Set to 0.
	U2ERE	Set to 0.
U2SMR	b0 to b7	Set to 0.
U2SMR2	b0 to b7	Set to 0.
U2SMR3	b0 to b7	Set to 0.
U2SMR4	b0 to b7	Set to 0.
U2SMR5	MP	Set to 1.
	MPIE	Set to 1.
URXDF	DF2EN	Select the digital filter enabled or disabled.

**Notes:**

1. Set the MPTB bit to 1 when the ID data frame is transmitted. Set this bit to 0 when the data frame is transmitted.
2. If the MPRB bit is set to 1, received D7 to D0 are ID fields. If the MPRB bit is set to 0, received D7 to D0 are data fields.

### 21.7.1 Multiprocessor Transmission

Figure 21.23 shows a Sample Flowchart of Multiprocessor Data Transmission. Set the MPBT bit in the U2TB register to 1 for ID transmission cycles. Set the MPBT bit in the U2TB register to 0 for data transmission cycles. Other operations are the same as in universal asynchronous receiver/transmitter mode (UART mode).

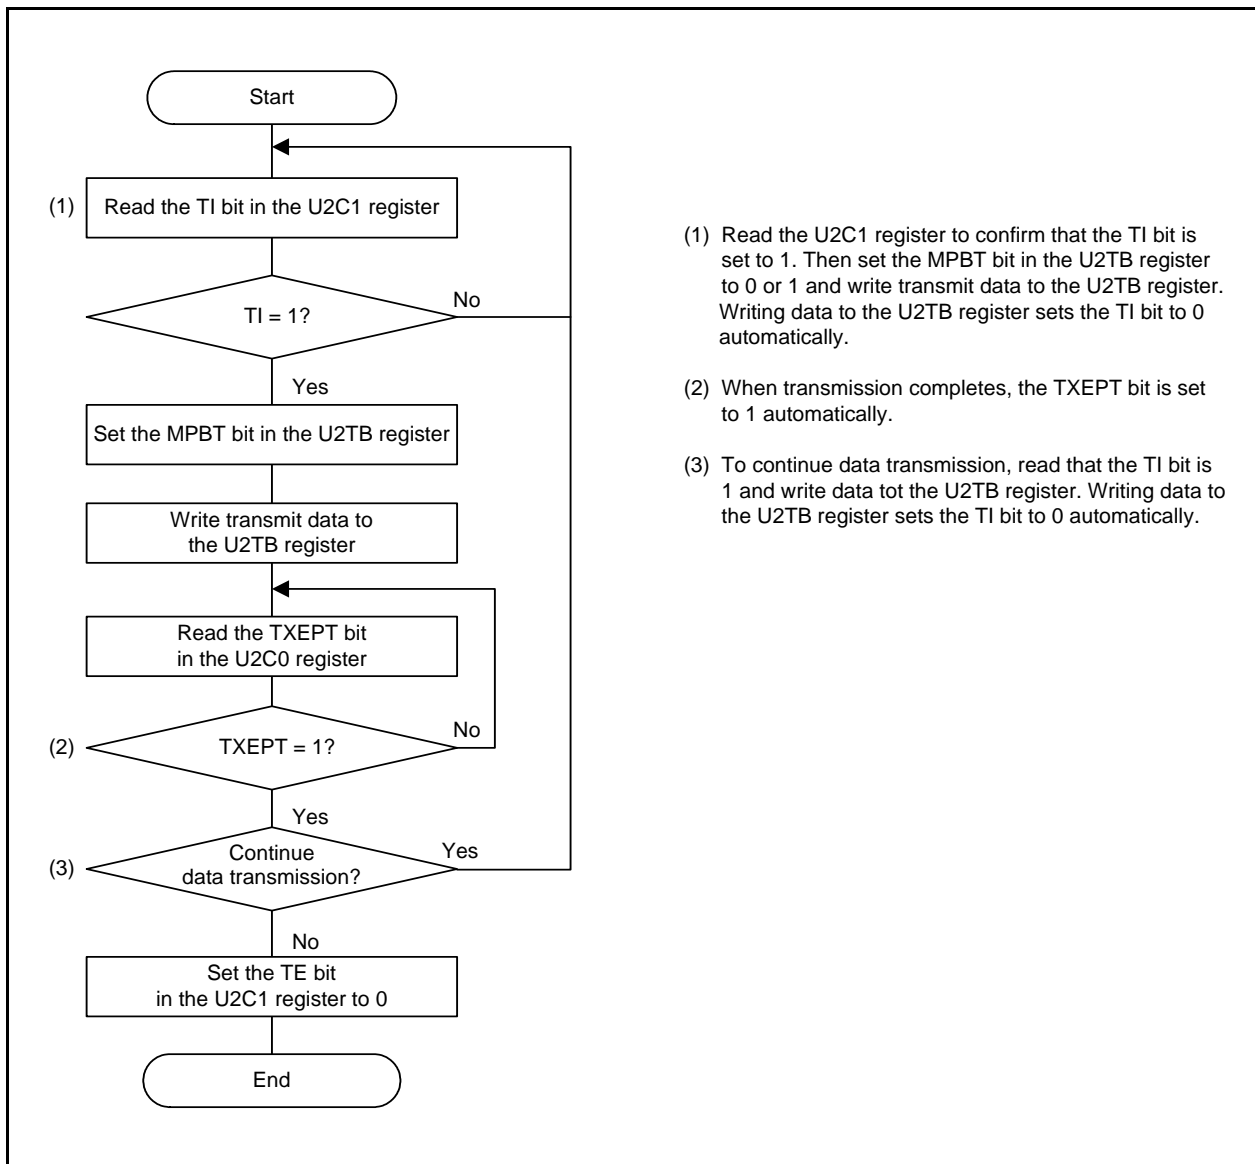

Figure 21.23 Sample Flowchart of Multiprocessor Data Transmission

### 21.7.2 Multiprocessor Reception

Figure 21.24 shows a Sample Flowchart of Multiprocessor Data Reception. When the MPPIE bit in the U2SMR5 register is set to 1, communication data is ignored until data in which the multiprocessor bit is 1 is received. Communication data with a 1 multiprocessor bit added is transferred to the U2RB register as receive data. At this time, a reception complete interrupt request is generated. Other operations are the same as in universal asynchronous receiver/transmitter mode (UART mode). Figure 21.25 shows a Receive Operation Example during Multiprocessor Communication (with 8-Bit Data/Multiprocessor Bit/One-Stop Bit).

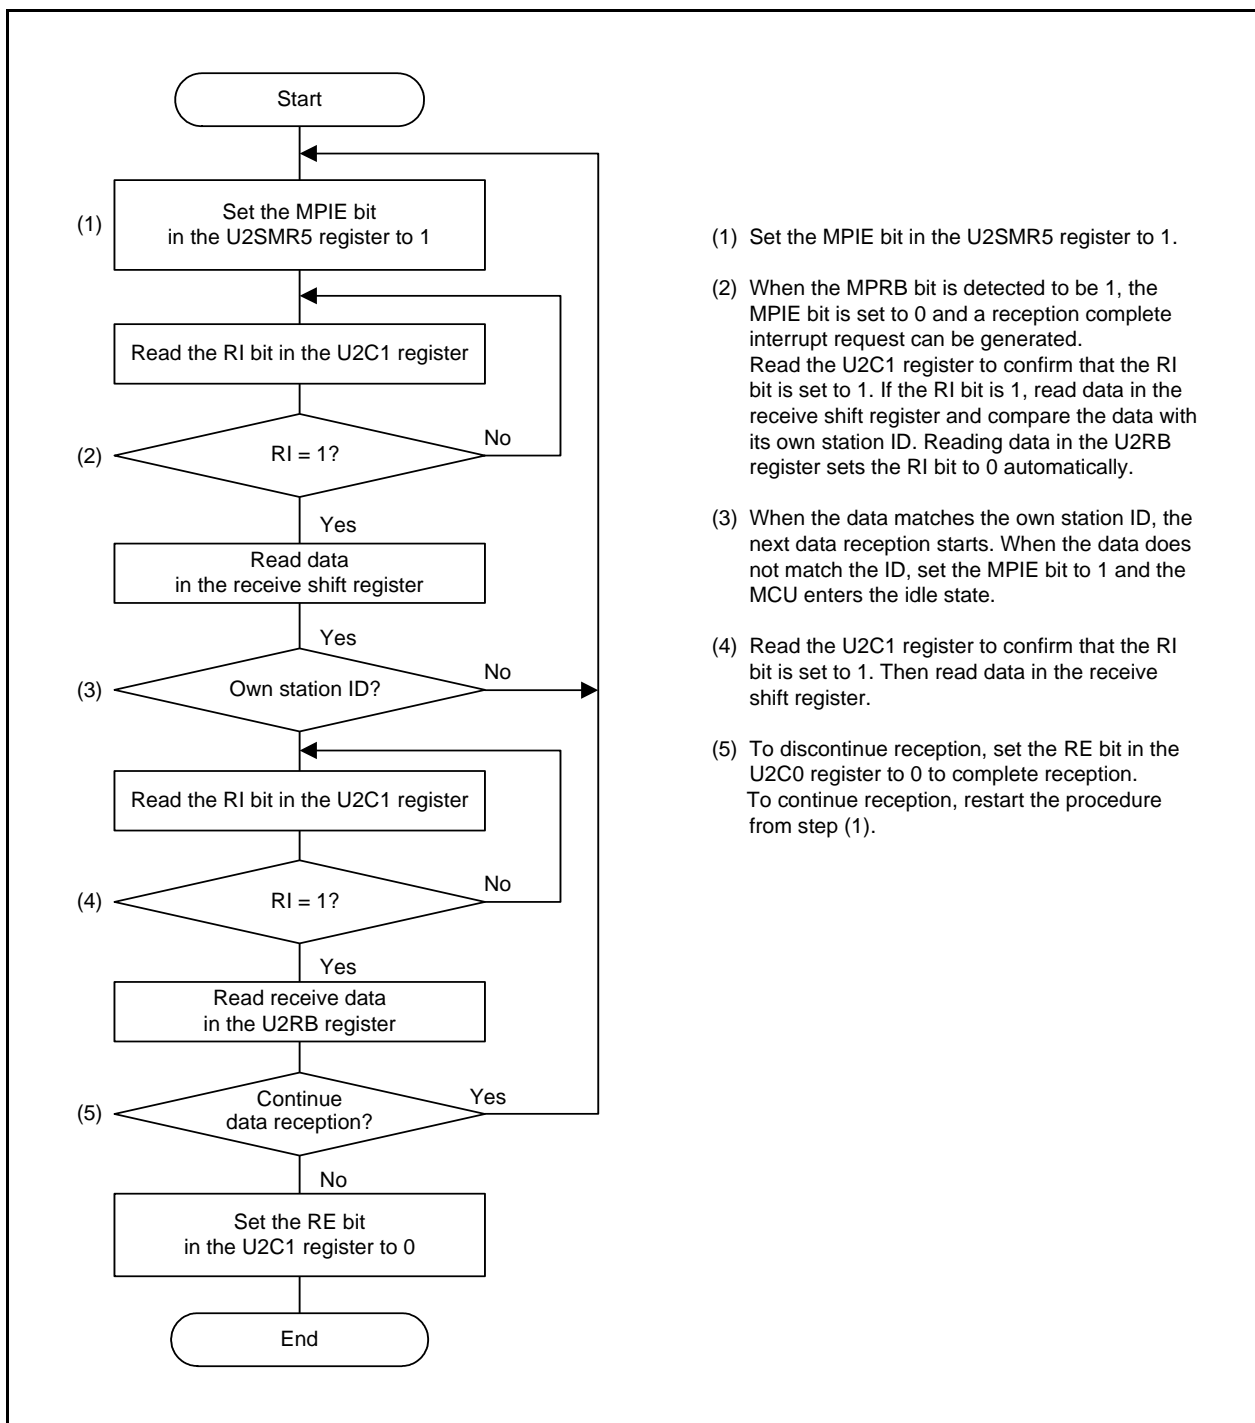

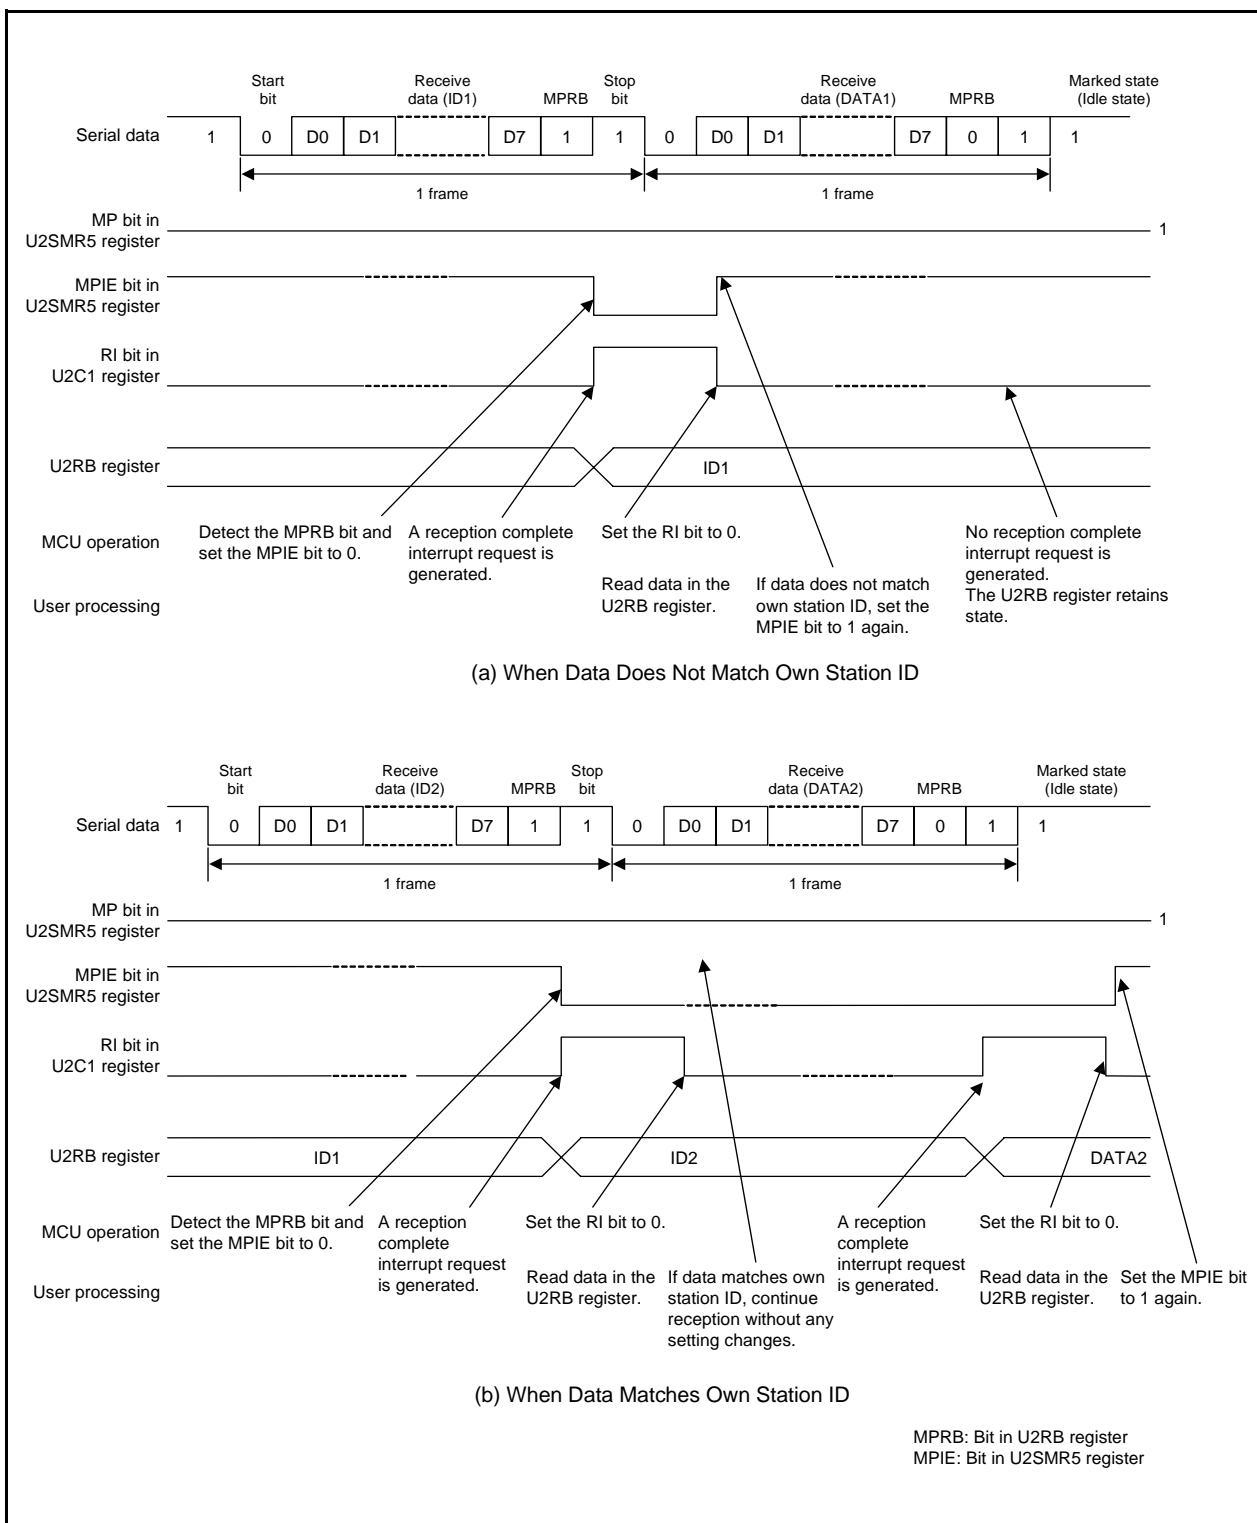

Figure 21.24 Sample Flowchart of Multiprocessor Data Reception

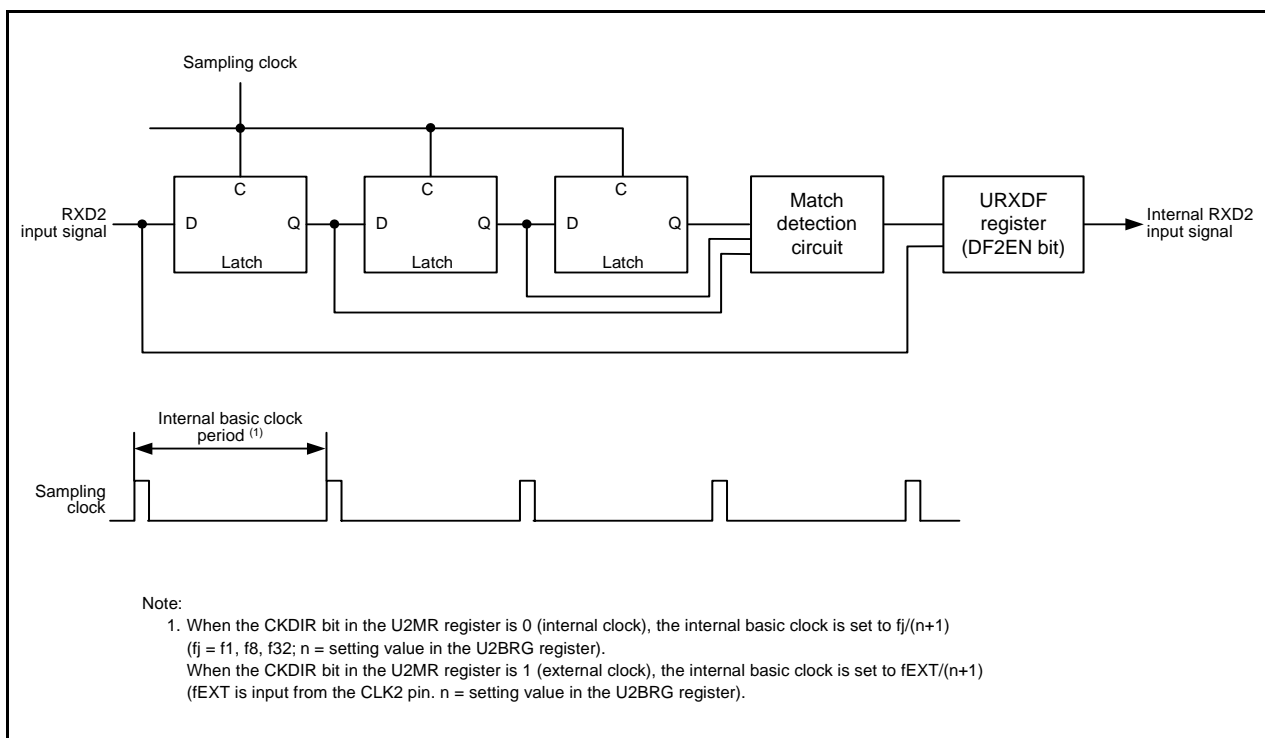

**Figure 21.25 Receive Operation Example during Multiprocessor Communication (with 8-Bit Data/Multiprocessor Bit/One-Stop Bit)**

### 21.7.3 RXD2 Digital Filter Select Function

When the DF2EN bit in the URXDF register is set to 1 (RXD2 digital filter enabled), the RXD2 input signal is loaded internally via the digital filter circuit for noise reduction. The noise canceller consists of three cascaded latch circuits and a match detection circuit. The RXD2 input signal is sampled on the internal basic clock with a frequency 16 times the bit rate. It is recognized as a signal and the level is passed forward to the next circuit when three latch outputs match. When the outputs do not match, the previous value is retained.

In other words, when the level is changed within three clocks, the change is recognized as not a signal but noise. Figure 21.26 shows a Block Diagram of RXD2 Digital Filter Circuit.

**Figure 21.26 Block Diagram of RXD2 Digital Filter Circuit**

## 21.8 Low-Voltage Signal Mode

Serial interface (UART0 to UART2) communication and the  $\overline{\text{INT}}$  input for the  $\overline{\text{INT}}$  interrupt can be performed using a low-voltage signal. Table 21.17 lists the Pins Usable for Inputting and Outputting Low-Voltage Signal. Depending on the setting of the TSMR register, the pins enabled for low-voltage signal mode is switched from schmitt input to CMOS input when they are used as input.

Set the input threshold values for CMOS input using registers VLT0 and VLT1.

When low-voltage signal mode is used, all inputs are set to CMOS input. Since schmitt input is disabled, always take countermeasures against noise.

**Table 21.17 Pins Usable for Inputting and Outputting Low-Voltage Signal**

Peripheral Function Name		Pin
Serial interface	UART0 Clock synchronous serial I/O Clock asynchronous serial I/O	CLK0, RXD0, TXD0
	UART1 Clock synchronous serial I/O Clock asynchronous serial I/O	CLK1, RXD1, TXD1
	UART2 Clock synchronous serial I/O Clock asynchronous serial I/O Special mode 1 (I <sup>2</sup> C mode) Special mode 2 (SSU mode) Multiprocessor communication function	CLK2, RXD2, TXD2, CTS2, RTS2, SCL2, SDA2
$\overline{\text{INT}}$	$\overline{\text{INT0}}$ to $\overline{\text{INT3}}$	$\overline{\text{INT0}}$ to $\overline{\text{INT3}}$

## 21.9 Notes on Serial Interface (UART2)

### 21.9.1 Clock Synchronous Serial I/O Mode

#### 21.9.1.1 Transmission/Reception

When the  $\overline{\text{RTS}}$  function is used with an external clock, the  $\overline{\text{RTS2}}$  pin outputs “L,” which informs the transmitting side that the MCU is ready for a receive operation. The  $\overline{\text{RTS2}}$  pin outputs “H” when a receive operation starts. Therefore, the transmit timing and receive timing can be synchronized by connecting the  $\overline{\text{RTS2}}$  pin to the  $\overline{\text{CTS2}}$  pin of the transmitting side. The  $\overline{\text{RTS}}$  function is disabled when an internal clock is selected.

#### 21.9.1.2 Transmission

If an external clock is selected, the following conditions must be met while the external clock is held high when the CKPOL bit in the U2C0 register is set to 0 (transmit data output at the falling edge and receive data input at the rising edge of the transfer clock), or while the external clock is held low when the CKPOL bit is set to 1 (transmit data output at the rising edge and receive data input at the falling edge of the transfer clock).

- The TE bit in the U2C1 register = 1 (transmission enabled)
- The TI bit in the U2C1 register = 0 (data present in the U2TB register)
- If the  $\overline{\text{CTS}}$  function is selected, input on the  $\overline{\text{CTS2}}$  pin = “L”

#### 21.9.1.3 Reception

In clock synchronous serial I/O mode, the shift clock is generated by activating the transmitter. Set the UART2-associated registers for transmit operation even if the MCU is used for receive operation only. Dummy data is output from the TXD2 pin while receiving.

When an internal clock is selected, the shift clock is generated by setting the TE bit in the U2C1 register to 1 (transmission enabled) and placing dummy data in the U2TB register. When an external clock is selected, set the TE bit to 1 (transmission enabled), place dummy data in the U2TB register, and input an external clock to the CLK2 pin to generate the shift clock.

If data is received consecutively, an overrun error occurs when the RE bit in the U2C1 register is set to 1 (data present in the U2RB register) and the next receive data is received in the UART2 receive register. Then, the OER bit in the U2RB register is set to 1 (overrun error). At this time, the U2RB register value is undefined. If an overrun error occurs, the IR bit in the S2RIC register remains unchanged.

To receive data consecutively, set dummy data in the low-order byte in the U2TB register per each receive operation.

If an external clock is selected, the following conditions must be met while the external clock is held high when the CKPOL bit is set to 0, or while the external clock is held low when the CKPOL bit is set to 1.

- The RE bit in the U2C1 register = 1 (reception enabled)
- The TE bit in the U2C1 register = 1 (transmission enabled)
- The TI bit in the U2C1 register = 0 (data present in the U2TB register)

### 21.9.2 Special Mode 1 (I<sup>2</sup>C Mode)

When generating start, stop, and restart conditions, set the STSPSEL bit in the U2SMR4 register to 0 and wait for more than half cycle of the transfer clock before changing each condition generation bit (STAREQ, RSTAREQ, and STPREQ) from 0 to 1.

## 22. Hardware LIN

The hardware LIN performs LIN communication in cooperation with timer RA and UART0.

### 22.1 Overview

The hardware LIN has the features listed below.

Figure 22.1 shows a Hardware LIN Block Diagram.

The wake-up function for each mode is detected using  $\overline{\text{INT1}}$ .

Master mode

- Synch Break generation
- Bus collision detection

Slave mode

- Synch Break detection
- Synch Field measurement
- Control function for Synch Break and Synch Field signal inputs to UART0
- Bus collision detection

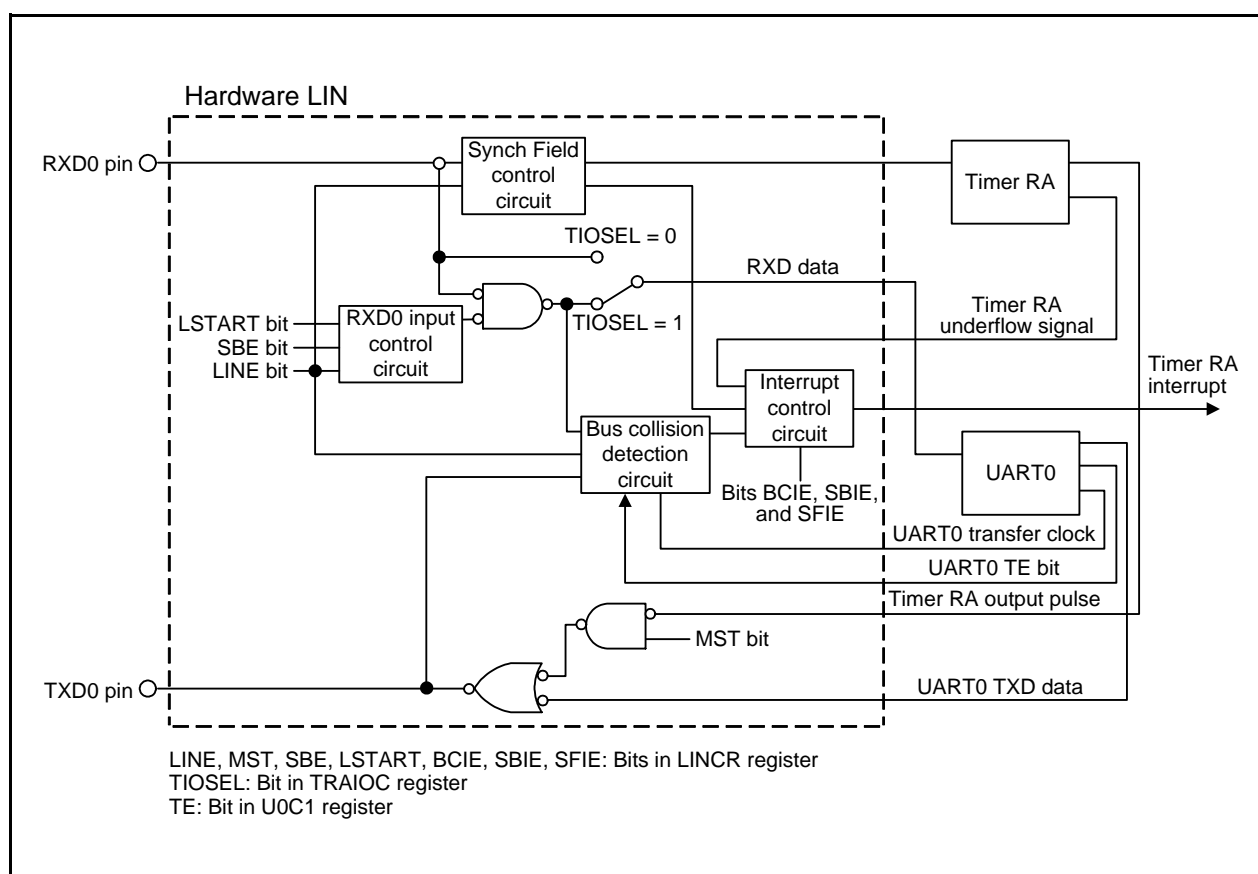

Figure 22.1 Hardware LIN Block Diagram

## 22.2 Input/Output Pins

The pin configuration for the hardware LIN is listed in Table 22.1.

**Table 22.1 Hardware LIN Pin Configuration**

Name	Pin Name	Assigned Pin	Input/Output	Function
Receive data input	RXD0	P1_5 (1)	Input	Receive data input pin for the hardware LIN
Transmit data output	TXD0	P1_4 (2)	Output	Transmit data output pin for the hardware LIN

Notes:

1. To use the hardware LIN, refer to Table 7.18.
2. To use the hardware LIN, set the TXD0SEL0 bit in the U0SR register to 1.

## 22.3 Registers

The hardware LIN contains the following registers:

- LIN Control Register 2 (LINCR2)
- LIN Control Register (LINCR)
- LIN Status Register (LINST)

### 22.3.1 LIN Control Register 2 (LINCR2)

Address 0105h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	—	—	—	BCE
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	BCE	Bus collision detection during Sync Break transmission enable bit	0: Bus collision detection disabled 1: Bus collision detection enabled	R/W
b1	—	Reserved bits	Set to 0.	R/W
b2	—			
b3	—			
b4	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b5	—			
b6	—			
b7	—			

### 22.3.2 LIN Control Register (LINCR)

Address 0106h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	LINE	MST	SBE	LSTART	RXDSF	BCIE	SBIE	SFIE
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	SFIE	Synch Field measurement-completed interrupt enable bit	0: Synch Field measurement-completed interrupt disabled 1: Synch Field measurement-completed interrupt enabled	R/W
b1	SBIE	Synch Break detection interrupt enable bit	0: Synch Break detection interrupt disabled 1: Synch Break detection interrupt enabled	R/W
b2	BCIE	Bus collision detection interrupt enable bit	0: Bus collision detection interrupt disabled 1: Bus collision detection interrupt enabled	R/W
b3	RXDSF	RXD0 input status flag	0: RXD0 input enabled 1: RXD0 input disabled	R
b4	LSTART	Synch Break detection start bit <sup>(1)</sup>	When this bit is set to 1, timer RA input is enabled and RXD0 input is disabled. When read, the content is 0.	R/W
b5	SBE	RXD0 input unmasking timing select bit (effective only in slave mode)	0: Unmasked after Synch Break detected 1: Unmasked after Synch Field measurement completed	R/W
b6	MST	LIN operation mode setting bit <sup>(2)</sup>	0: Slave mode (Synch Break detection circuit operation) 1: Master mode (timer RA output OR'ed with TXD0)	R/W
b7	LINE	LIN operation start bit	0: LIN operation stops 1: LIN operation starts <sup>(3)</sup>	R/W

Notes:

1. After setting the LSTART bit, confirm that the RXDSF flag is set to 1 before Synch Break input starts.
2. Before switching LIN operation modes, stop the LIN operation (LINE bit = 0) once.
3. Inputs to timer RA and UART0 are disabled immediately after the LINE bit is set to 1 (LIN operation starts). (Refer to **Figure 22.3 Header Field Transmission Flowchart Example (1)** and **Figure 22.7 Header Field Reception Flowchart Example (2).**)

### 22.3.3 LIN Status Register (LINST)

Address 0107h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	B2CLR	B1CLR	B0CLR	BCDCT	SBDCT	SFDCT
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	SFDCT	Synch Field measurement-completed flag	When this bit is set to 1, Synch Field measurement is completed.	R
b1	SBDCT	Synch Break detection flag	when this bit is set to 1, Synch Break is detected or Synch Break generation is completed.	R
b2	BCDCT	Bus collision detection flag	When this bit is set to 1, bus collision is detected.	R
b3	B0CLR	SFDCT bit clear bit	When this bit is set to 1, the SFDCT bit is set to 0. When read, the content is 0.	R/W
b4	B1CLR	SBDCT bit clear bit	When this bit is set to 1, the SBDCT bit is set to 0. When read, the content is 0.	R/W
b5	B2CLR	BCDCT bit clear bit	When this bit is set to 1, the BCDCT bit is set to 0. When read, the content is 0.	R/W
b6	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b7	—			

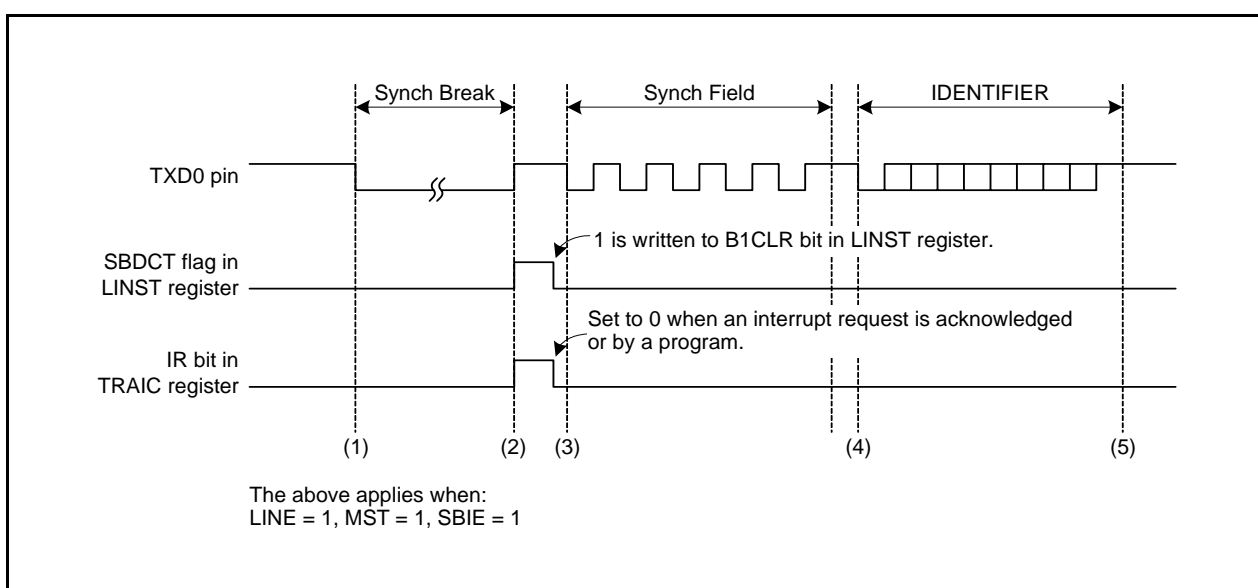

## 22.4 Function Description

### 22.4.1 Master Mode

Figure 22.2 shows an Operating Example during Header Field Transmission in master mode. Figures 22.3 and 22.4 show Examples of Header Field Transmission Flowchart.

During header field transmission, the hardware LIN operates as follows:

- (1) When 1 is written to the TSTART bit in the TRACR register for timer RA, a “L” level is output from the TXD0 pin for the period set in registers TRAPRE and TRA for timer RA.
- (2) When timer RA underflows, the TXD0 pin output is inverted and the SBDCT flag in the LINST register is set to 1. If the SBIE bit in the LINC register is set to 1, a timer RA interrupt is generated.
- (3) The hardware LIN transmits “55h” via UART0.
- (4) After the hardware LIN completes transmitting “55h”, it transmits an ID field via UART0.
- (5) After the hardware LIN completes transmitting the ID field, it performs communication for a response field.

**Figure 22.2 Operating Example during Header Field Transmission**

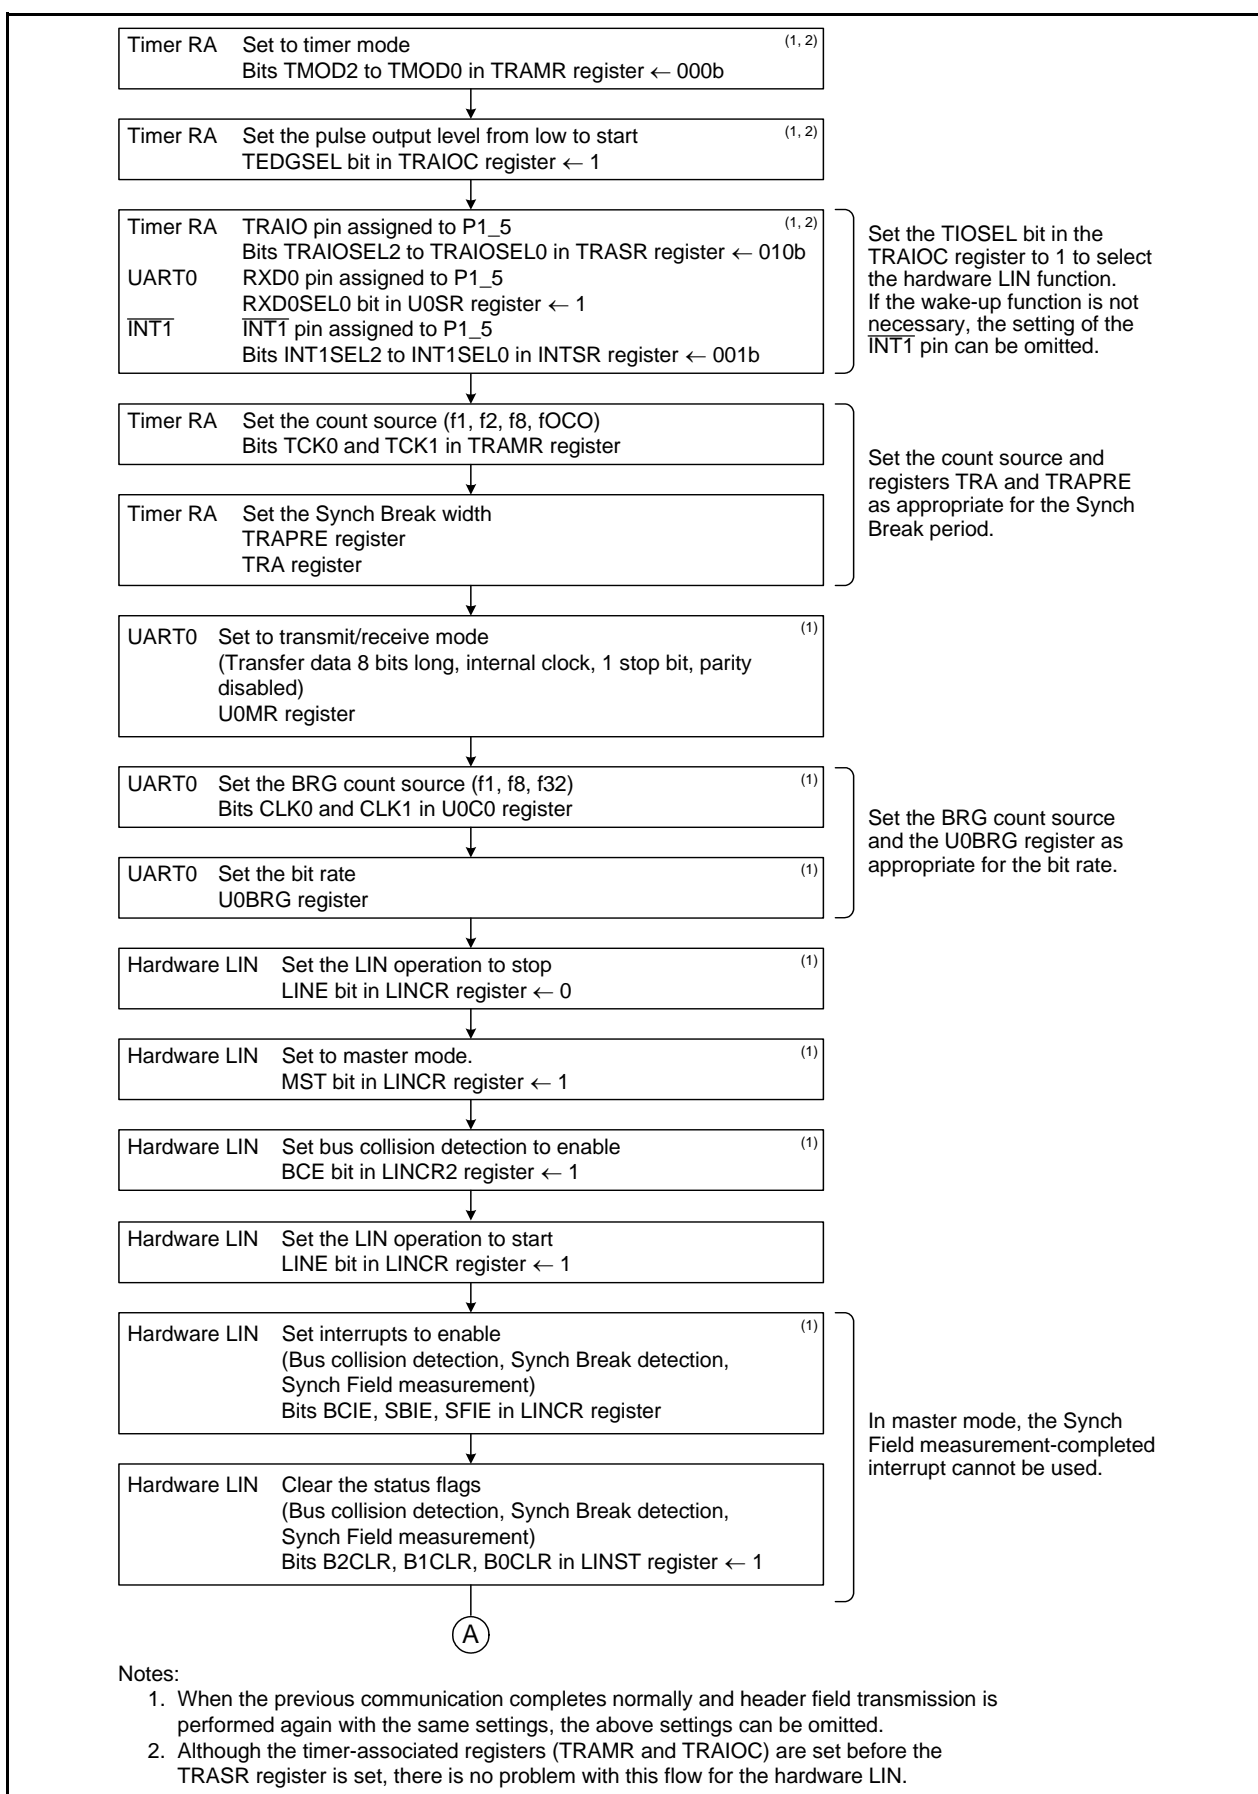

Figure 22.3 Header Field Transmission Flowchart Example (1)

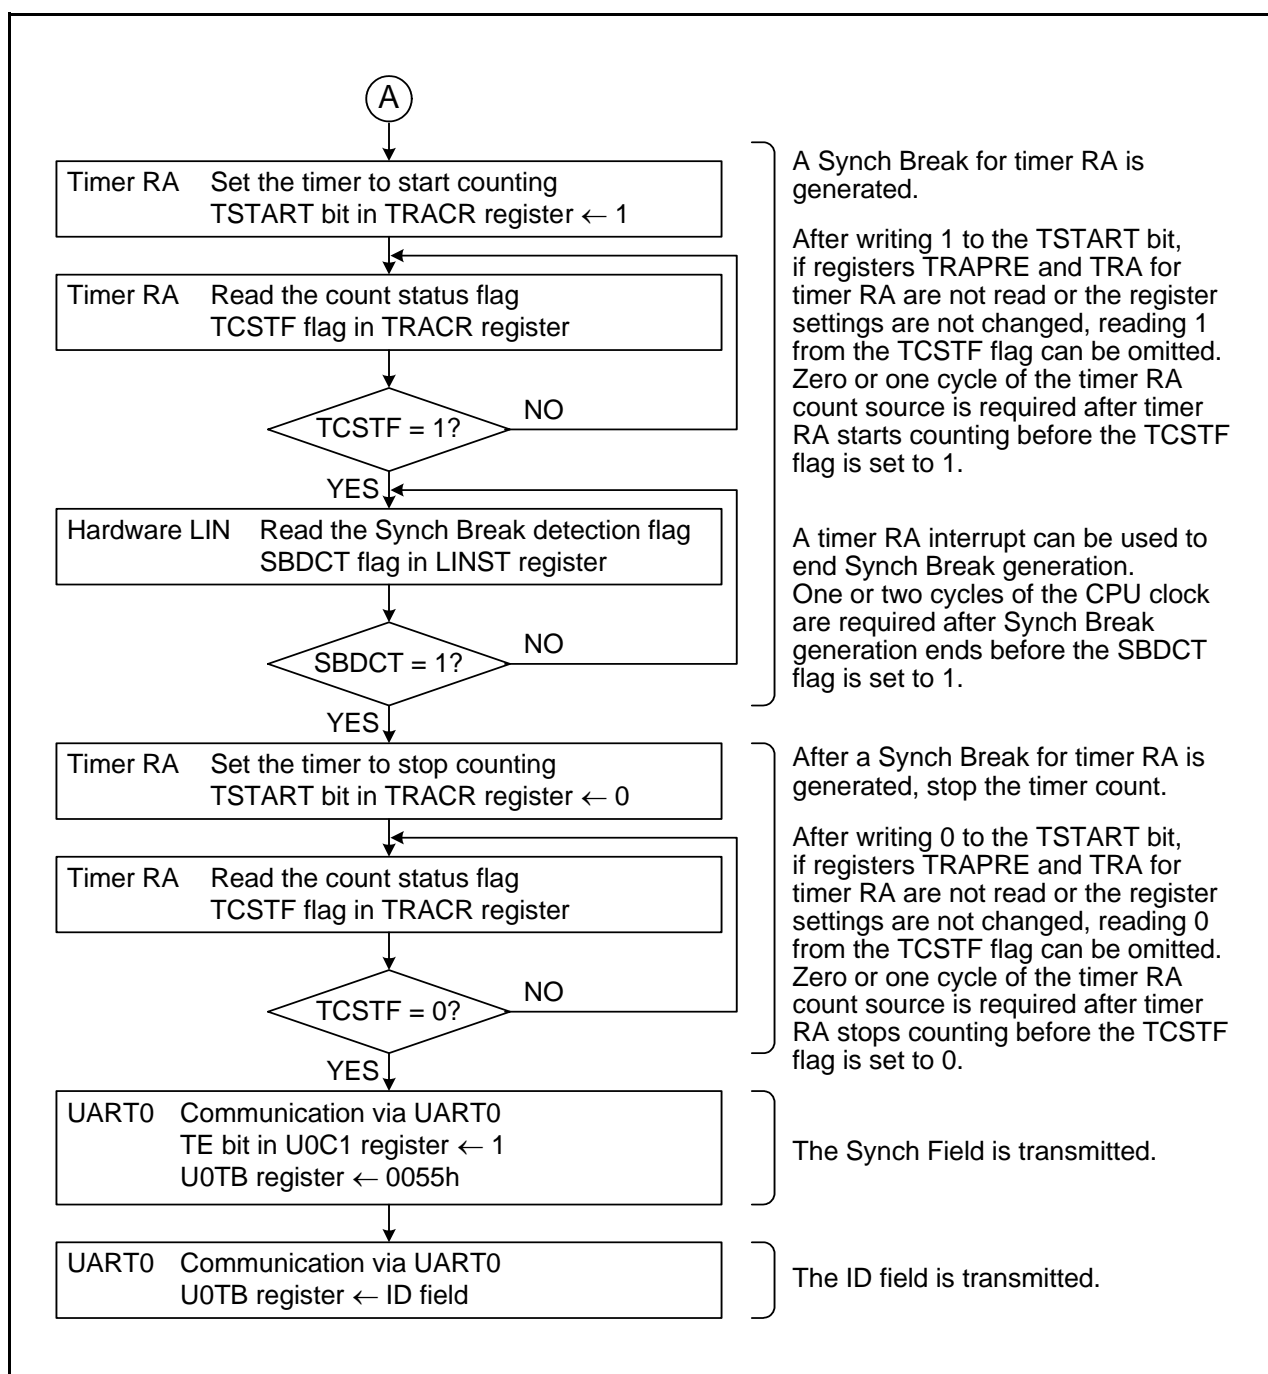

Figure 22.4 Header Field Transmission Flowchart Example (2)

### 22.4.2 Slave Mode

Figure 22.5 shows an Operating Example during Header Field Reception in slave mode. Figures 22.6 to 22.8 show examples of Header Field Reception Flowchart.

During header field reception, the hardware LIN operates as follows:

- (1) When 1 is written to the LSTART bit in the LINCR register for the hardware LIN, Synch Break detection is enabled.
- (2) If a “L” level is input for a duration equal to or longer than the period set in timer RA, the hardware LIN detected it as a Synch Break. At this time, the SBDCT flag in the LINST register is set to 1. If the SBIE bit in the LINCR register is set to 1, a timer RA interrupt is generated. Then the hardware LIN enters the Synch Field measurement.
- (3) The hardware LINA receives a Synch Field (55h) and measures the period of the start bit and bits 0 to 6 is using timer RA. At this time, whether to input the Synch Field signal to RXD0 of UART0 can be selected by the SBE bit in the LINCR register.
- (4) When the Synch Field measurement is completed, the SFDCT flag in the LINST register is set to 1. If the SFIE bit in the LINCR register is set to 1, a timer RA interrupt is generated.
- (5) After the Synch Field measurement is completed, a transfer rate is calculated from the timer RA count value. The rate is set in UART0 and registers TRAPRE and TRA for timer RA are set again. Then the hardware LIN receives an ID field via UART0.
- (6) After the hardware LIN completes receiving the ID field, it performs communication for a response field.

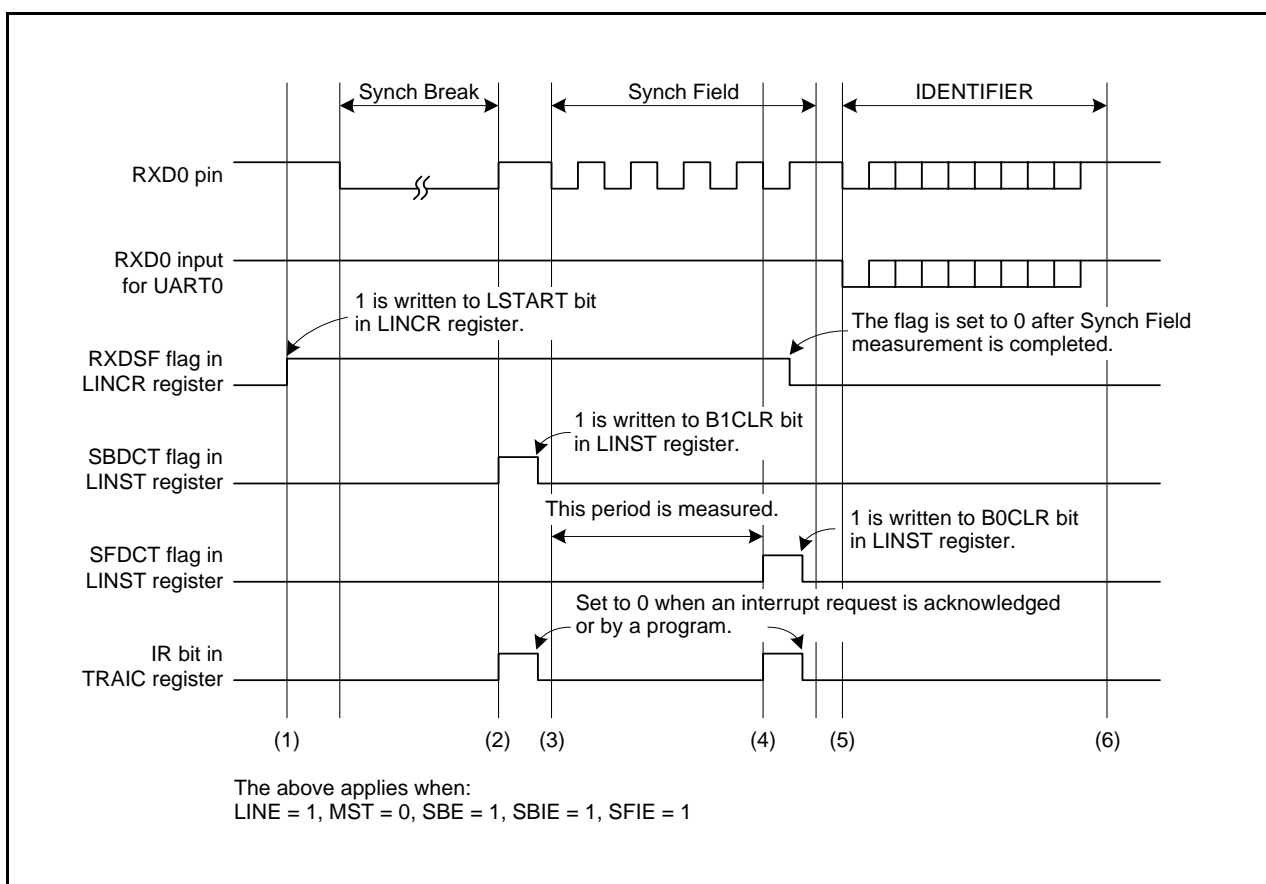

Figure 22.5 Operating Example during Header Field Reception

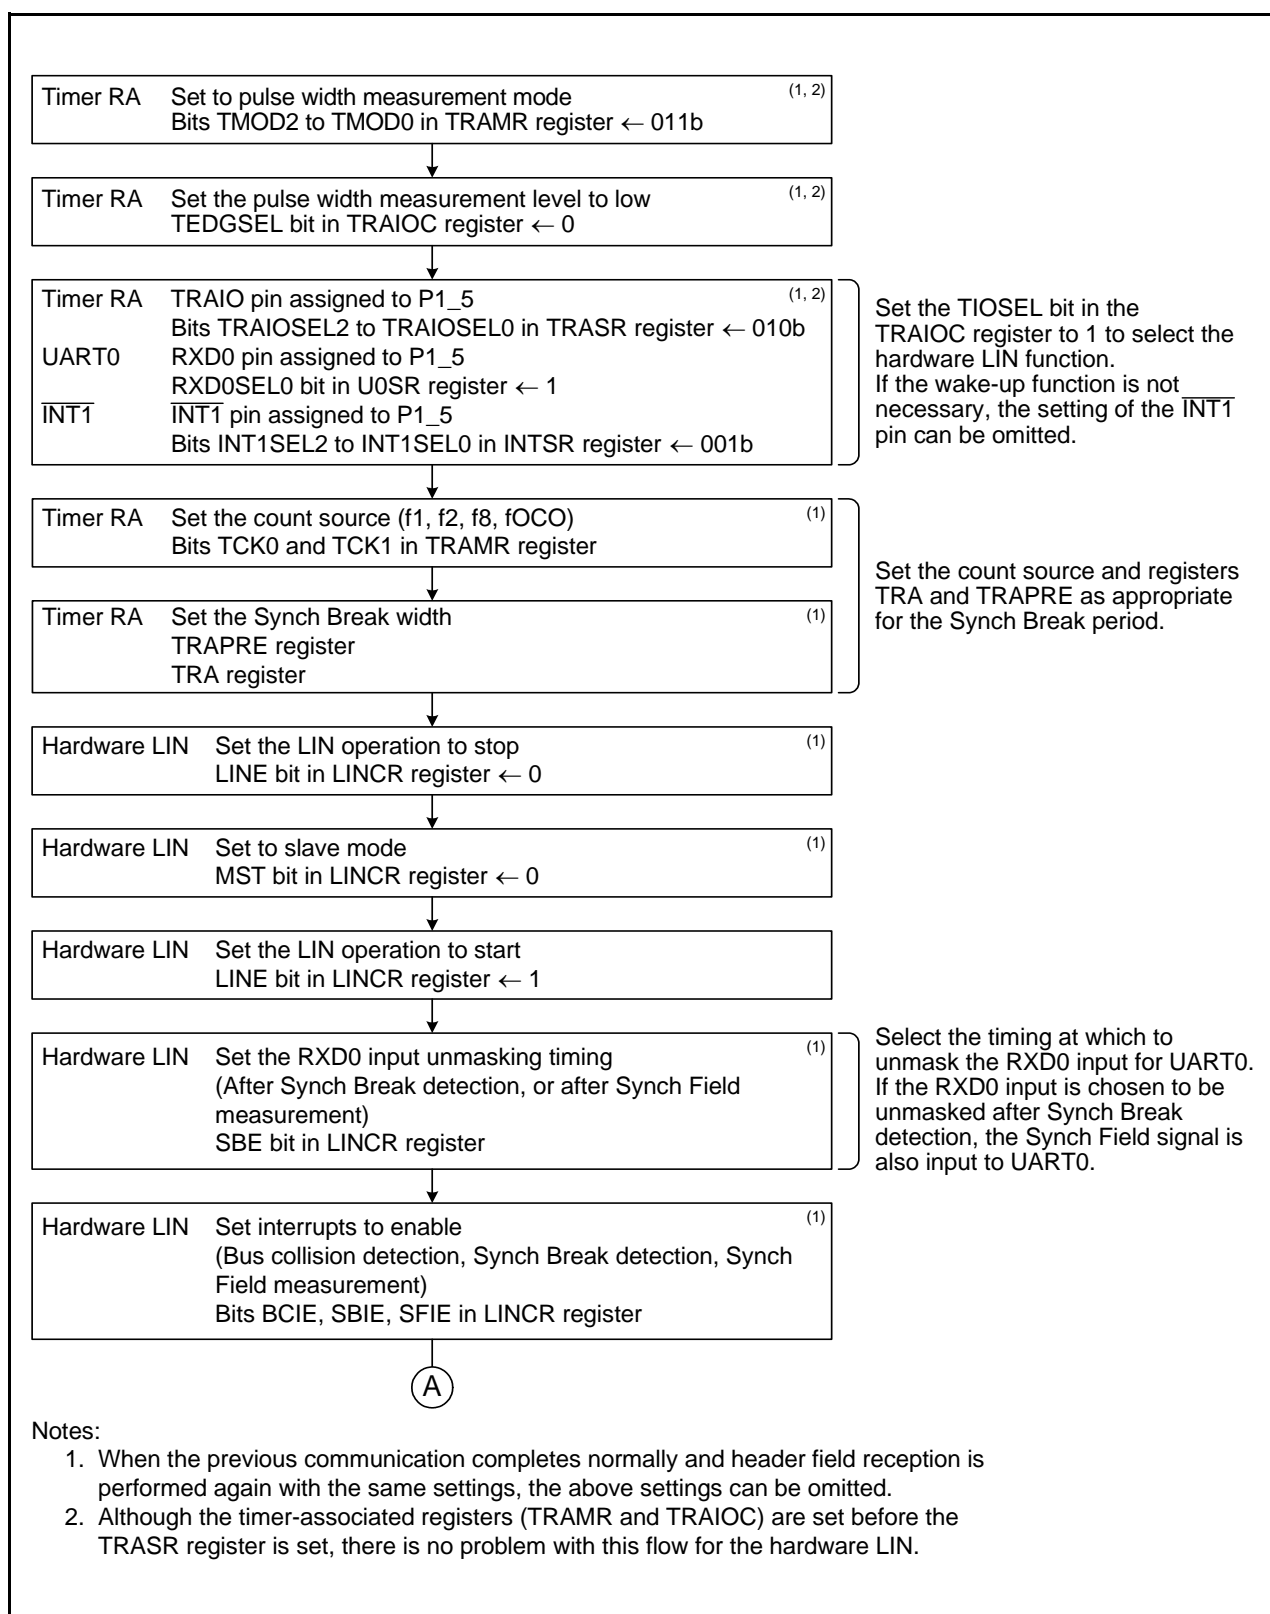

Figure 22.6 Header Field Reception Flowchart Example (1)

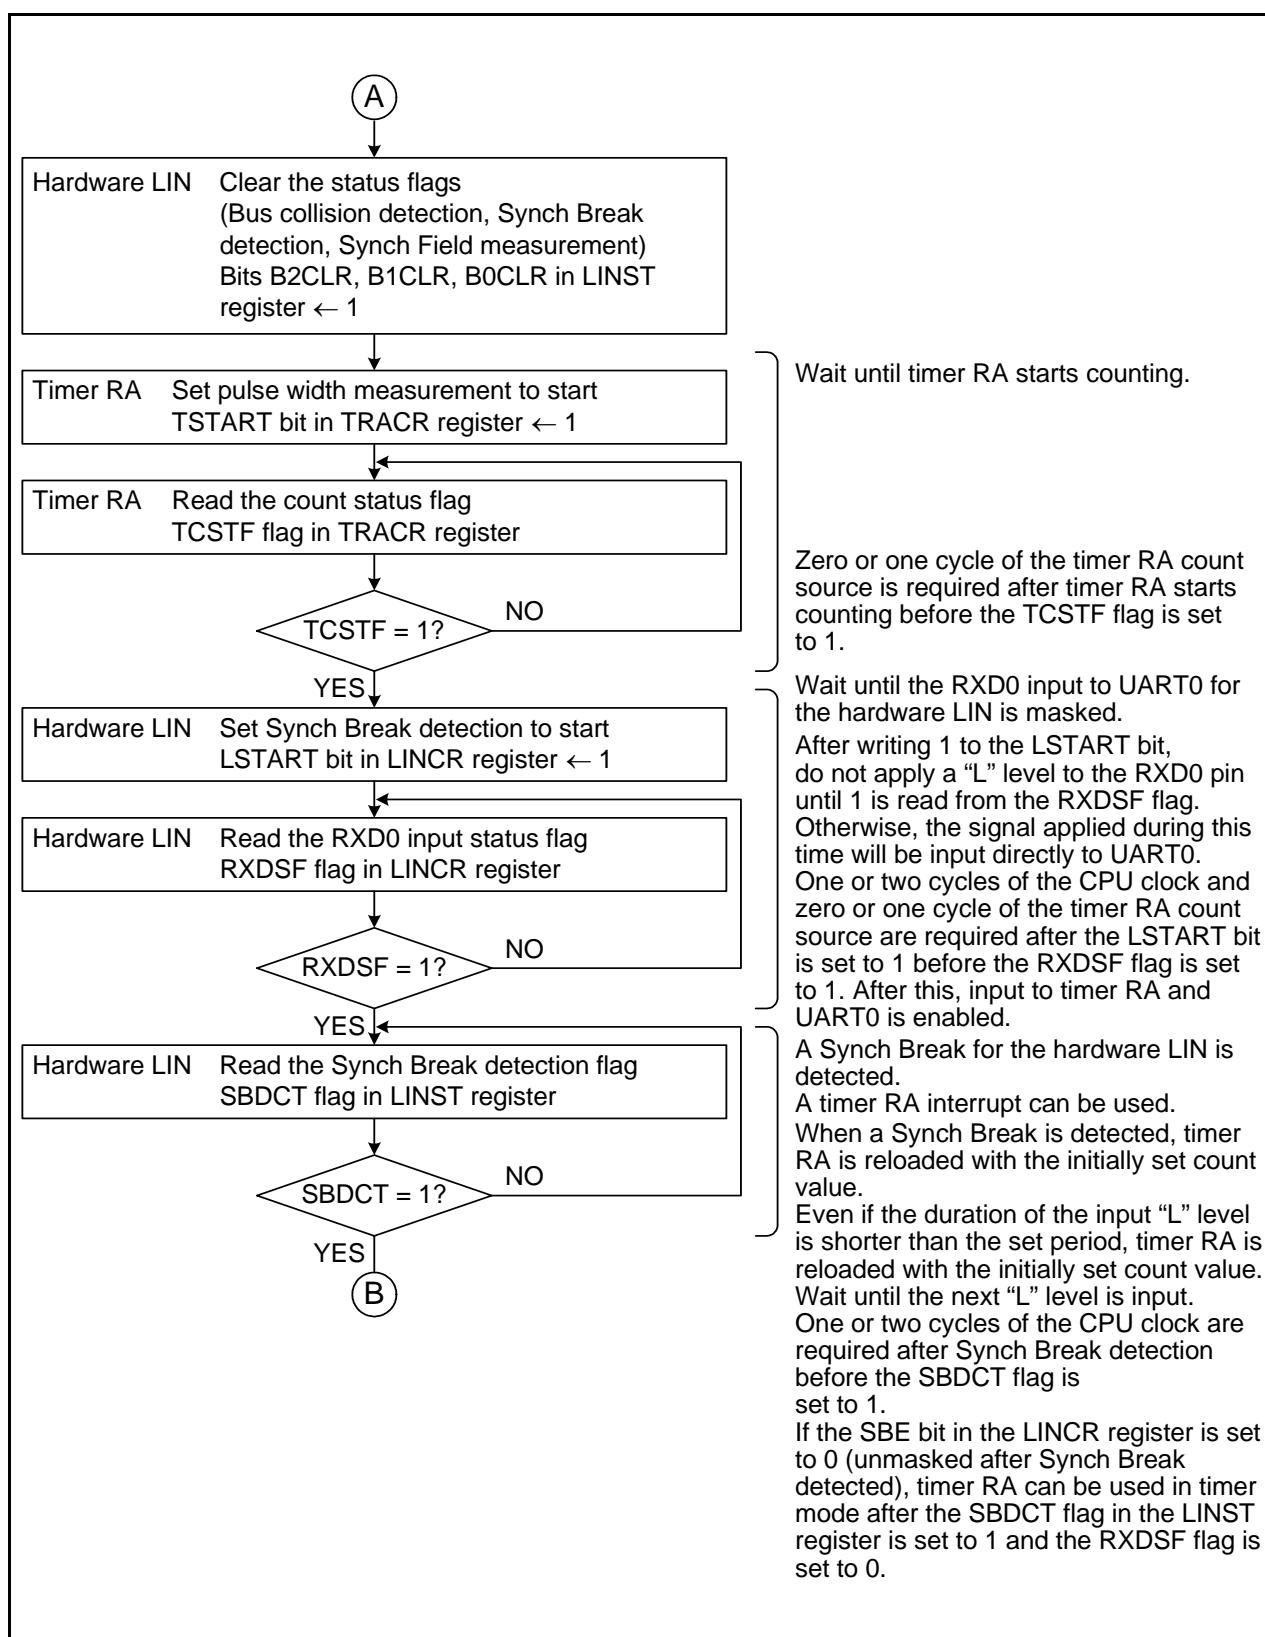

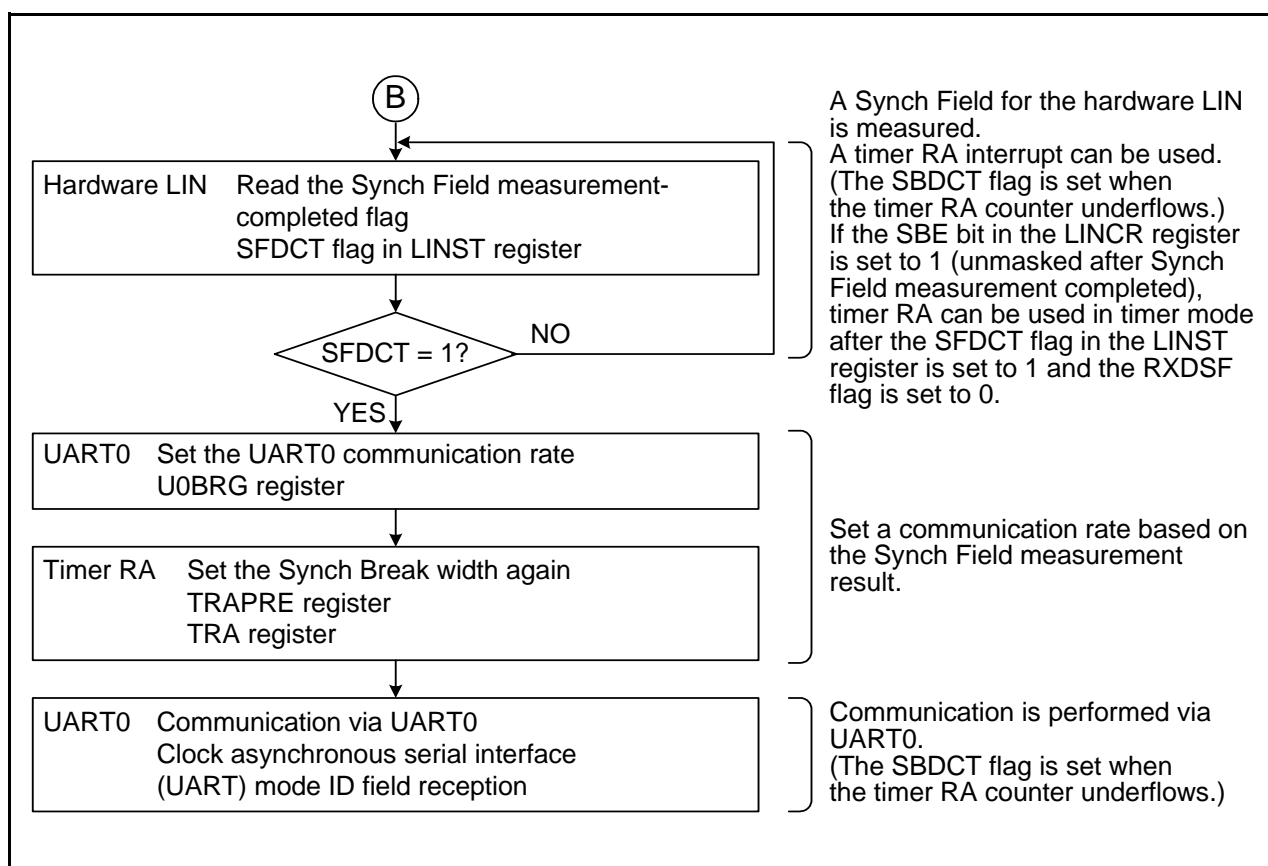

Figure 22.7 Header Field Reception Flowchart Example (2)

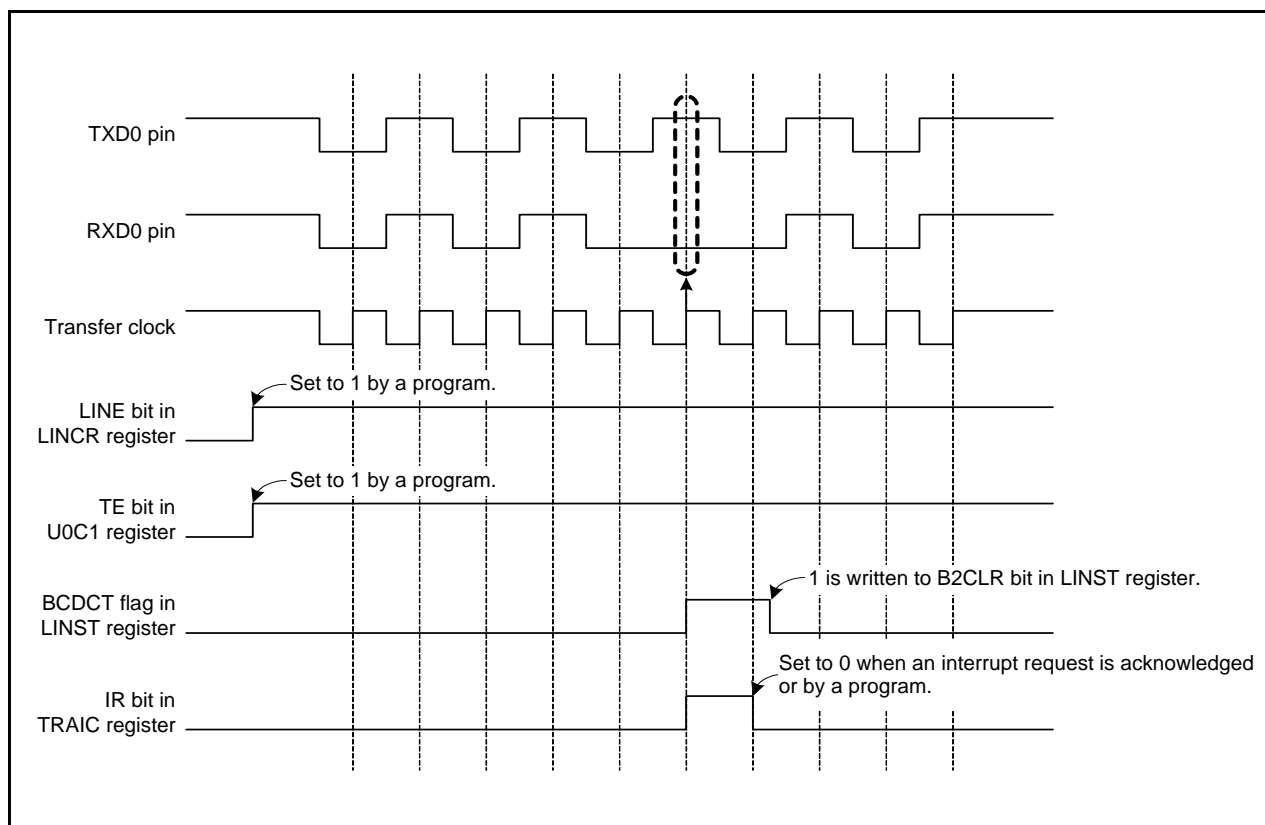

**Figure 22.8 Header Field Reception Flowchart Example (3)**

### 22.4.3 Bus Collision Detection Function

The bus collision detection function can be used if UART0 is enabled for transmission (TE bit in U0C1 register = 1). To detect a bus collision during Synch Break transmission, set the BCE bit in the LINCR2 register to 1 (bus collision detection enabled).

Figure 22.9 shows an Operating Example When Bus Collision is Detected.

**Figure 22.9** Operating Example When Bus Collision is Detected

### 22.4.4 Hardware LIN End Processing

Figure 22.10 shows an Example of Hardware LIN Communication Completion Flowchart.

Use the following timing for hardware LIN end processing:

- If the hardware bus collision detection function is used  
Perform hardware LIN end processing after checksum transmission completes.
- If the bus collision detection function is not used  
Perform hardware LIN end processing after header field transmission and reception complete.

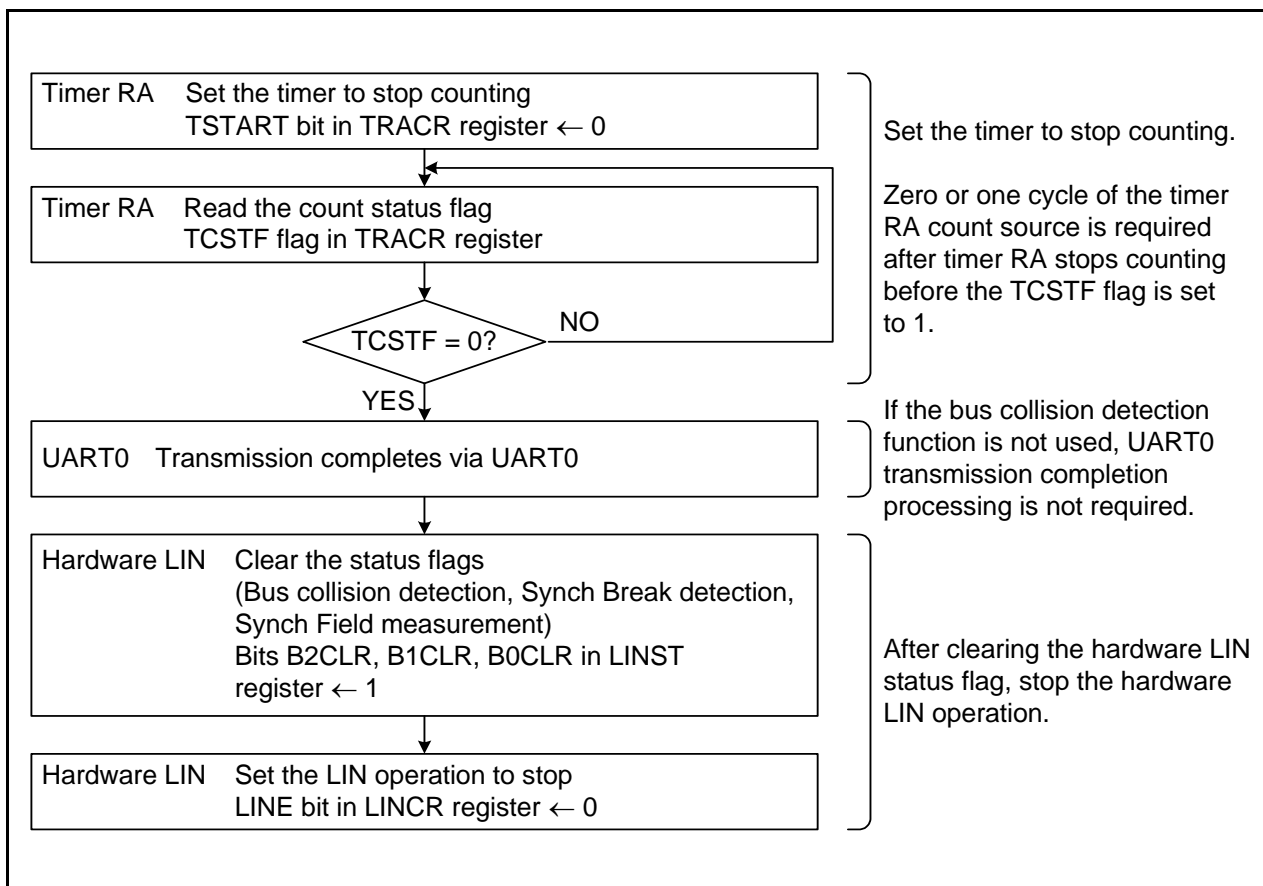

Figure 22.10 Example of Hardware LIN Communication Completion Flowchart

## 22.5 Interrupt Requests

There are four interrupt requests generated by the hardware LIN: Synch Break detection, Completion of Synch Break generation, Completion of Synch Field measurement, and bus collision detection. These interrupts are shared with timer RA.

Table 22.2 lists the Hardware LIN Interrupt Requests.

**Table 22.2 Hardware LIN Interrupt Requests**

Interrupt Request	Status Flag	Interrupt Source
Synch Break detection	SBDCT	Generated when timer RA underflows after the “L” level duration for the RXD0 input is measured, or when a “L” level is input for a duration longer than the Synch Break period during communication.
Completion of Synch Break generation		Generated when a “L” level output to TXD0 for the duration set by timer RA is completed.
Completion of Synch Field measurement	SFDCT	Generated when measurement for 6 bits of the Lynch Field by timer RA is completed.
Bus collision detection	BCDCT	Generated when the RXD0 input and TXD0 output values are different at data latch timing while UART0 is enabled for transmission.

## 22.6 Notes on Hardware LIN

For the time-out processing of the header and response fields, use another timer to measure the duration of time with a Synch Break detection interrupt as the starting point.

## 23. A/D Converter

The A/D converter consists of one 10-bit successive approximation A/D converter circuit with a capacitive coupling amplifier. The analog input shares pins P0\_0 to P0\_7, and P1\_0 to P1\_3.

### 23.1 Overview

Table 23.1 lists the A/D Converter Performance. Figure 23.1 shows a Block Diagram of A/D Converter.

**Table 23.1 A/D Converter Performance**

Item	Performance
A/D conversion method	Successive approximation (with capacitive coupling amplifier)
Analog input voltage <sup>(1)</sup>	0 V to AVCC
Operating clock $\phi_{AD}$ <sup>(2)</sup>	fAD, fAD divided by 2, fAD divided by 4, fAD divided by 8 (fAD=f1 or fOCO-F)
Resolution	8 bits or 10 bits selectable
Absolute accuracy	AVCC = Vref = 5 V, $\phi_{AD}$ = 20 MHz • 8-bit resolution $\pm 2$ LSB • 10-bit resolution $\pm 3$ LSB AVCC = Vref = 3.3 V, $\phi_{AD}$ = 16 MHz • 8-bit resolution $\pm 2$ LSB • 10-bit resolution $\pm 5$ LSB AVCC = Vref = 3.0 V, $\phi_{AD}$ = 10 MHz • 8-bit resolution $\pm 2$ LSB • 10-bit resolution $\pm 5$ LSB AVCC = Vref = 2.2 V, $\phi_{AD}$ = 5 MHz • 8-bit resolution $\pm 2$ LSB • 10-bit resolution $\pm 5$ LSB
Operating mode	One-shot mode, repeat mode 0, repeat mode 1, single sweep mode, and repeat sweep mode
Analog input pin	12 pins (AN0 to AN11)
A/D conversion start condition	• Software trigger • Timer RC • External trigger (Refer to <b>23.3.3 A/D Conversion Start Condition.</b> )
Conversion rate per pin ( $\phi_{AD}$ = fAD) <sup>(3)</sup>	Minimum 43 $\phi_{AD}$ cycles

Notes:

1. When the analog input voltage is over the reference voltage, the A/D conversion result will be 3FFh in 10-bit mode and FFh in 8-bit mode.
2. Refer to **Table 27.3 A/D Converter Characteristics** for the operating clock  $\phi_{AD}$ .
3. The conversion rate per pin is minimum 43  $\phi_{AD}$  cycles for 8-bit and 10-bit resolution.

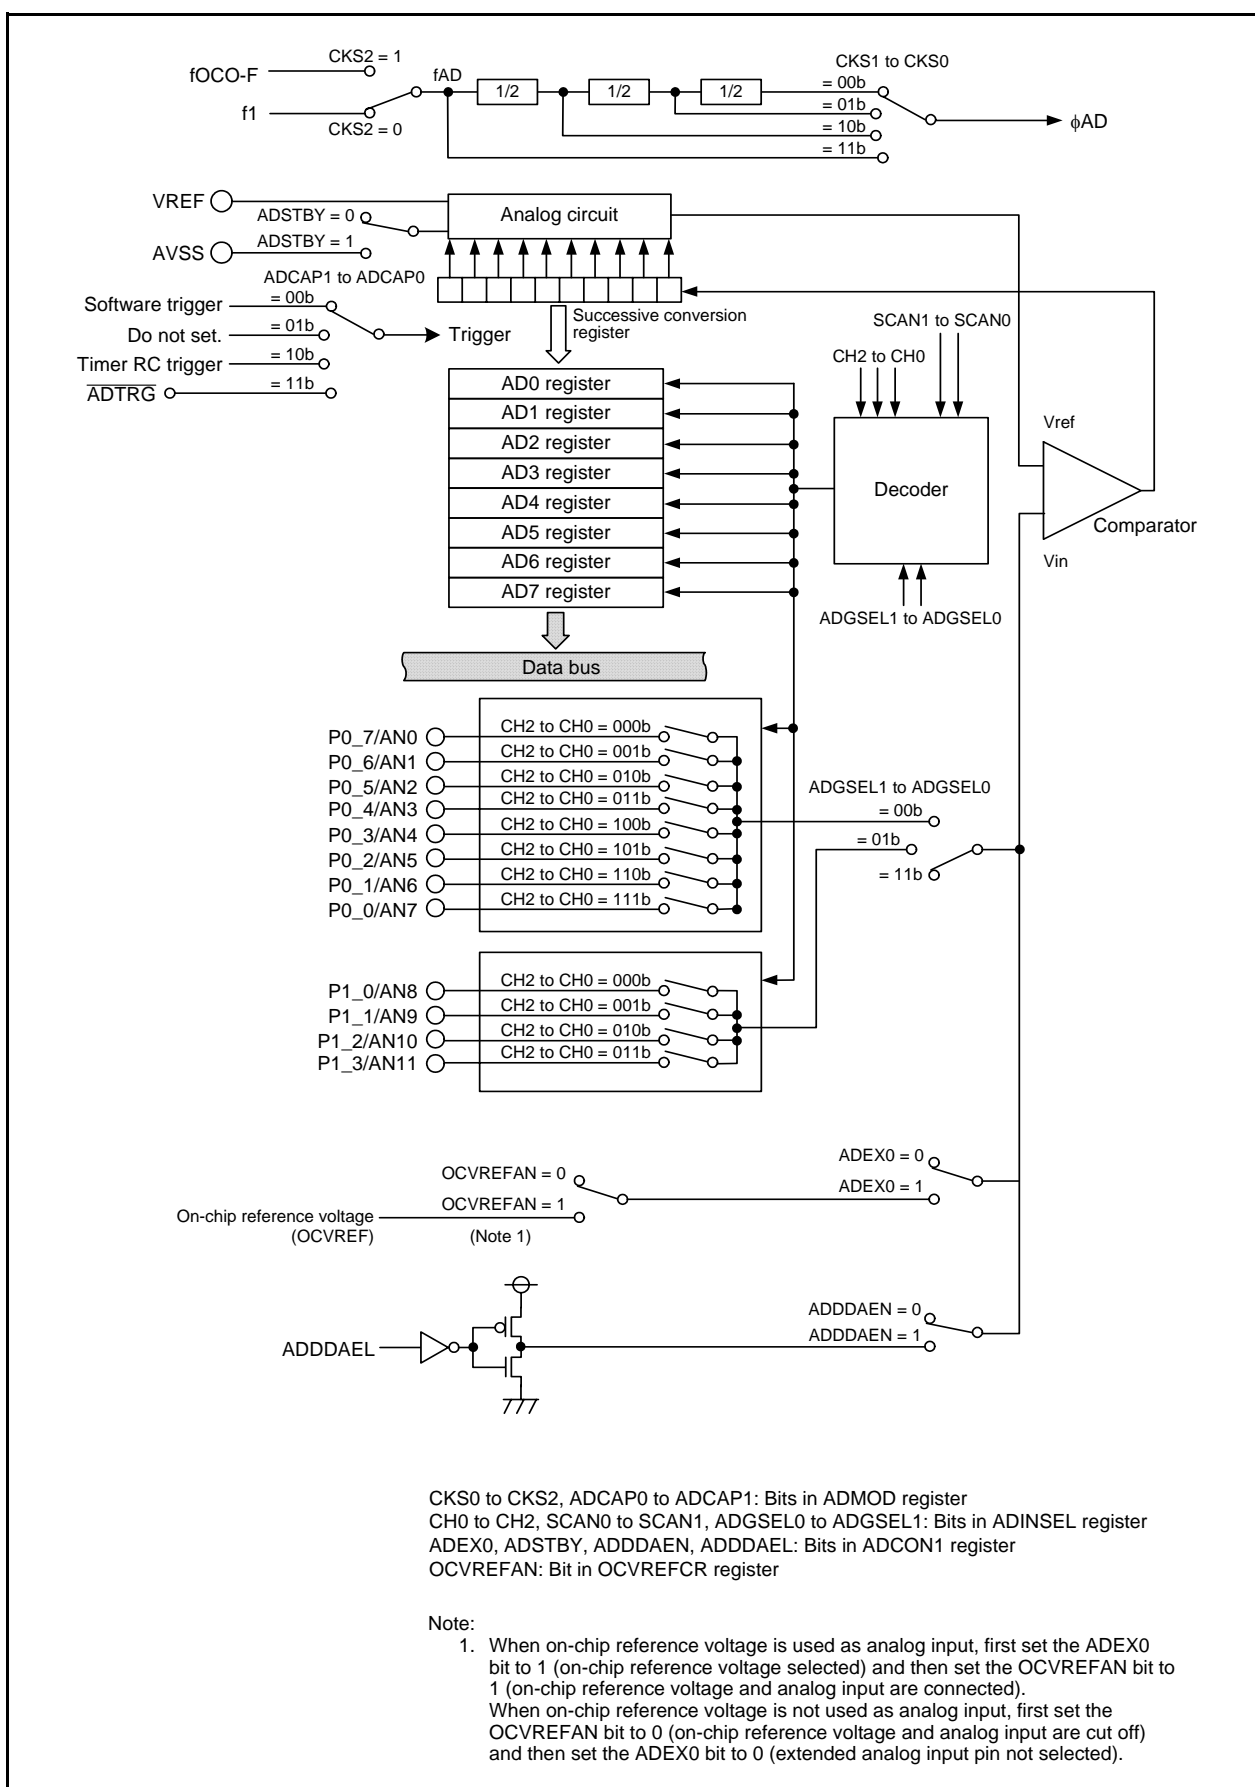

Figure 23.1 Block Diagram of A/D Converter

## 23.2 Registers

### 23.2.1 On-Chip Reference Voltage Control Register (OCVREFCR)

Address 0026h

Bit	b7	b6	b5	b4	b3	b2	b1	b0

After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	OCVREFAN	On-chip reference voltage to analog input connect bit <sup>(1)</sup>	0: On-chip reference voltage and analog input are cut off 1: On-chip reference voltage and analog input are connected	R/W
b1	—	Reserved bits	Set to 0.	R/W
b2	—			
b3	—			
b4	—			
b5	—			
b6	—			
b7	—			

Note:

1. When on-chip reference voltage is used as analog input, first set the ADEX0 bit in the ADCON1 register to 1 (on-chip reference voltage selected) and then set the OCVREFAN bit to 1 (on-chip reference voltage and analog input are connected).

When on-chip reference voltage is not used as analog input, first set the OCVREFAN bit to 0 (on-chip reference voltage and analog input are cut off) and then set the ADEX0 bit to 0 (extended analog input pin not selected).

Set the PRC3 bit in the PRCR register to 1 (write enabled) before rewriting the OCVREFCR register.

If the contents of the OCVREFCR register are rewritten during A/D conversion, the conversion result is undefined.

### 23.2.2 A/D Register i (ADi) (i = 0 to 7)

Address 00C1h to 00C0h (AD0), 00C3h to 00C2h (AD1), 00C5h to 00C4h (AD2),  
00C7h to 00C6h (AD3), 00C9h to 00C8h (AD4), 00CBh to 00CAh (AD5),  
00CDh to 00CCh (AD6), 00CFh to 00CEh (AD7)

b5	—			
b6	—			
b7	—			

#### ADST Bit (A/D conversion start flag)

[Conditions for setting to 1]

When A/D conversion starts and while A/D conversion is in progress.

[Condition for setting to 0]

When A/D conversion stops.

### 23.2.6 A/D Control Register 1 (ADCON1)

Address 00D7h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	ADDDAEL	ADDDAEN	ADSTBY	BITS	—	—	—	ADEX0
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	ADEX0	Extended analog input pin select bit <sup>(1)</sup>	0: Extended analog input pin not selected 1: On-chip reference voltage selected (2, 5, 6)	R/W
b1	—	Reserved bits	Set to 0.	R/W
b2	—			
b3	—			
b4	BITS	8/10-bit mode select bit	0: 8-bit mode 1: 10-bit mode	R/W
b5	ADSTBY	A/D standby bit <sup>(3)</sup>	0: A/D operation stops (standby) 1: A/D operation enabled	R/W
b6	ADDDAEN	A/D open-circuit detection assist function enable bit (4, 6)	0: Disabled 1: Enabled	R/W
b7	ADDDAEL	A/D open-circuit detection assist method select bit <sup>(4)</sup>	0: Discharge before conversion 1: Precharge before conversion	R/W

#### Notes:

- When on-chip reference voltage is used as analog input, first set the ADEX0 bit to 1 (on-chip reference voltage selected) and then set the OCVREFAN bit in the OCVREFCR register to 1 (on-chip reference voltage and analog input are connected).  
When on-chip reference voltage is not used as analog input, first set the OCVREFAN bit to 0 (on-chip reference voltage and analog input are cut off) and then set the ADEX0 bit to 0 (extended analog input pin not selected).
- Do not set to 1 (A/D conversion using comparison reference voltage as input) in single sweep mode or repeat sweep mode.
- When the ADSTBY bit is changed from 0 (A/D operation stops) to 1 (A/D operation enabled), wait for 1  $\phi$ AD cycle or more before starting A/D conversion.
- To enable the A/D open-circuit detection assist function, select the conversion start state with the ADDDAEL bit after setting the ADDDAEN bit to 1 (enabled).  
The conversion result with an open circuit varies with external circuits. Careful evaluation should be performed according to the system before using this function.
- When on-chip reference voltage is used (ADEX0 = 1), set bits CH2 to CH0 in the ADINSEL register to 000b.
- When on-chip reference voltage is used (ADEX0 = 1), set the ADDDAEN bit to 0 (A/D open-circuit detection assist function disabled).

If the ADCON1 register is rewritten during A/D conversion, the conversion result is undefined.

## 23.3 Common Items for Multiple Modes

### 23.3.1 Input/Output Pins

The analog input shares pins P0\_0 to P0\_7, and P1\_0 to P1\_3 in AN0 to AN11.

When using the AN<sub>i</sub> (i = 0 to 11) pin as input, set the corresponding port direction bit to 0 (input mode).

After changing the A/D operating mode, select an analog input pin again.

### 23.3.2 A/D Conversion Cycles

Figure 23.2 shows a Timing Diagram of A/D Conversion. Figure 23.3 shows the A/D Conversion Cycles ( $\phi_{AD} = f_{AD}$ ).

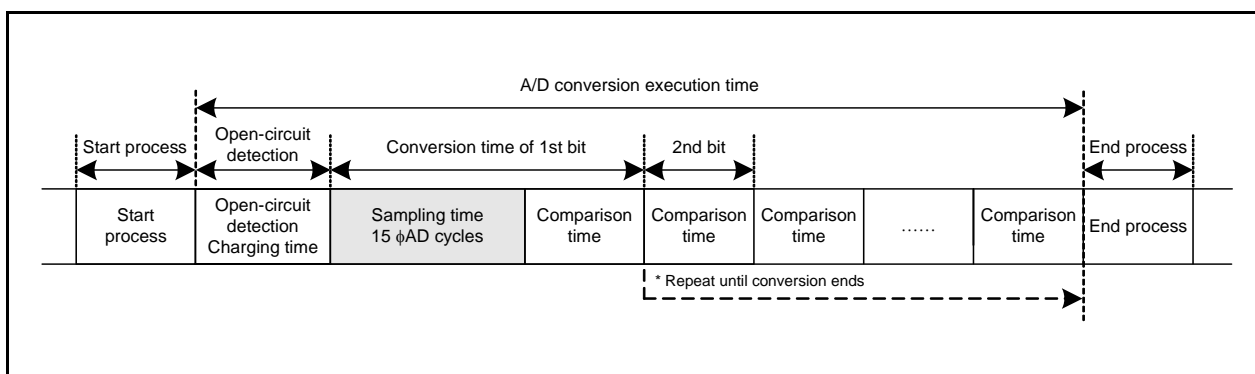

Figure 23.2 Timing Diagram of A/D Conversion

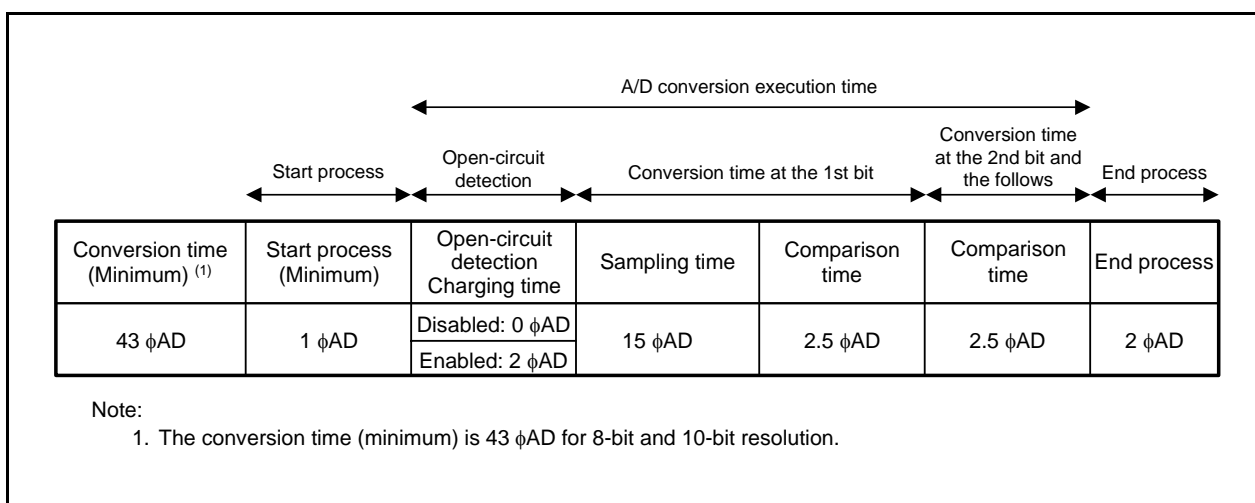

Figure 23.3 A/D Conversion Cycles ( $\phi_{AD} = f_{AD}$ )

Table 23.3 lists the Number of Cycles for A/D Conversion Items. The A/D conversion time is defined as follows.

The start process time varies depending on which  $\phi_{AD}$  is selected.

When 1 (A/D conversion starts) is written to the ADST bit in the ADCON0 register, an A/D conversion starts after the start process time has elapsed. Reading the ADST bit before the A/D conversion returns 0 (A/D conversion stops).

In the modes where an A/D conversion is performed on multiple pins or multiple times, the between-execution process time is inserted between the A/D conversion execution time for one pin and the next A/D conversion time.

In one-shot mode and single sweep mode, the ADST bit is set to 0 during the end process time and the last A/D conversion result is stored in the ADi register.

- In on-shot mode  
Start process time + A/D conversion execution time + end process time
- When two pins are selected in single sweep mode  
Start process time + (A/D conversion execution time + between-execution process time + A/D conversion execution time) + end process time

**Table 23.3 Number of Cycles for A/D Conversion Items**

A/D Conversion Item		Number of Cycles
Start process time	$\phi_{AD} = f_{AD}$	1 or 2 $f_{AD}$ cycles
	$\phi_{AD} = f_{AD}$ divided by 2	2 or 3 $f_{AD}$ cycles
	$\phi_{AD} = f_{AD}$ divided by 4	3 or 4 $f_{AD}$ cycles
	$\phi_{AD} = f_{AD}$ divided by 8	5 or 6 $f_{AD}$ cycles
A/D conversion execution time	Open-circuit detection disabled	40 $\phi_{AD}$ cycles
	Open-circuit detection enabled	42 $\phi_{AD}$ cycles
Between-execution process time		1 $\phi_{AD}$ cycle
End process time		2 or 3 $f_{AD}$ cycles

### 23.3.3 A/D Conversion Start Condition

A software trigger, trigger from timer RC, and external trigger are used as A/D conversion start triggers. Figure 23.4 shows the Block Diagram of A/D Conversion Start Control Unit.

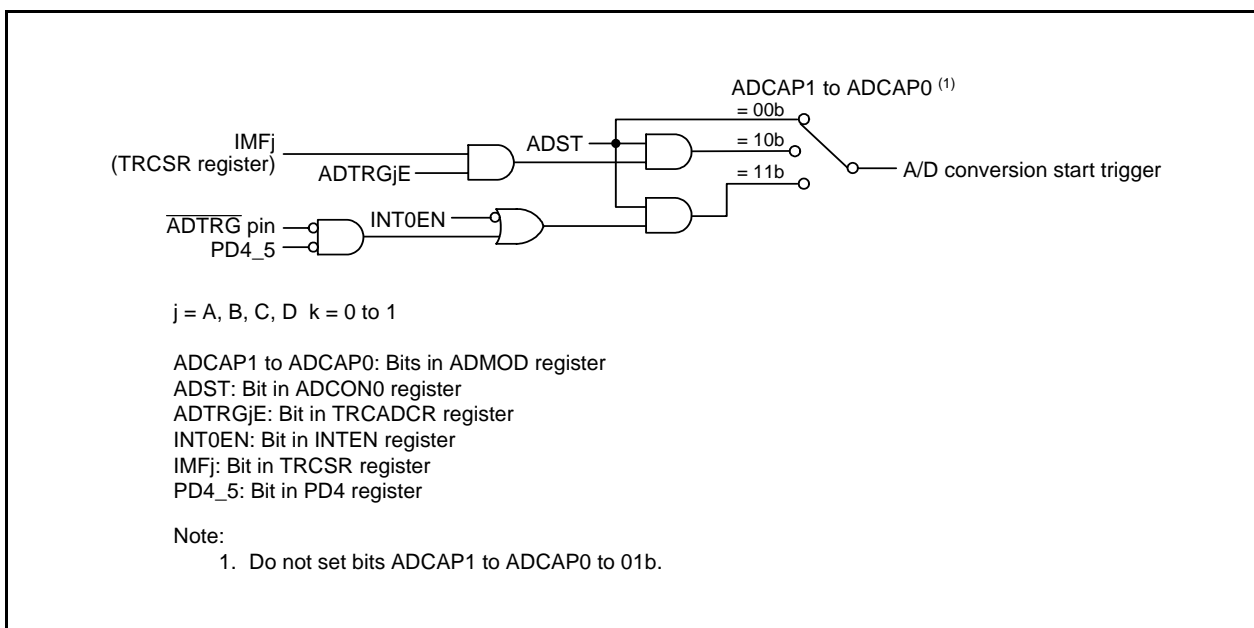

Figure 23.4 Block Diagram of A/D Conversion Start Control Unit

#### 23.3.3.1 Software Trigger

A software trigger is selected when bits ADCAP1 to ADCAP0 in the ADMOD register are set to 00b (software trigger).

The A/D conversion starts when the ADST bit in the ADCON0 register is set to 1 (A/D conversion starts).

#### 23.3.3.2 Trigger from Timer RC

This trigger is selected when bits ADCAP1 to ADCAP0 in the ADMOD register are set to 10b (timer RC).

To use this function, make sure the following conditions are met.

- Bits ADCAP1 to ADCAP0 in the ADMOD register are set to 10b (timer RC).
- Timer RC is used in the output compare function (timer mode, PWM mode, PWM2 mode).
- The ADTRGjE bit (j = A, B, C, D) in the TRCADCR register is set to 1 (A/D trigger occurs at compare match with TRCGRj register).
- The ADST bit in the ADCON0 register is set to 1 (A/D conversion starts).

When the IMFj bit in the TRCSR register is changed from 0 to 1, A/D conversion starts.

Refer to **19. Timer RC**, **19.5 Timer Mode (Output Compare Function)**, **19.6 PWM Mode**, **19.7 PWM2 Mode** for the details of timer RC and the output compare function (timer mode, PWM mode, and PWM2 mode).

### 23.3.3.3 External Trigger

This trigger is selected when bits ADCAP1 to ADCAP0 in the ADMOD register are set to 11b (external trigger ( $\overline{\text{ADTRG}}$ )).

To use this function, make sure the following conditions are met.

- Bits ADCAP1 to ADCAP0 in the ADMOD register are set to 11b (external trigger ( $\overline{\text{ADTRG}}$ )).
- Set the INT0EN bit in the INTEN register to 1 ( $\overline{\text{INT0}}$  input enabled) and the INT0PL bit to 0 (one edge), and set the POL bit in the INT0IC register to 0 (falling edge selected).
- The PD4\_5 bit in the PD4 register is set to 0 (input mode).
- Select the  $\overline{\text{INT0}}$  digital filter by bits INT0F1 to INT0F0 in the INTF register.
- The ADST bit in the ADCON0 register is set to 1 (A/D conversion starts).

The IR bit in the INT0IC register is set to 1 (interrupt requested) in accordance with the setting of the POL bit in the INT0IC register and the INT0PL bit in the INTEN register, and a change in the  $\overline{\text{ADTRG}}$  pin input (refer to **11.9 Notes on Interrupts**).

For details on interrupts, refer to **11. Interrupts**.

When the  $\overline{\text{ADTRG}}$  pin input is changed from “H” to “L” under the above conditions, A/D conversion starts.

### 23.3.4 A/D Conversion Result

The A/D conversion result is stored in the ADi register (i = 0 to 7). The register where the result is stored varies depending on the A/D operating mode used. The contents of the ADi register are undefined after a reset. Values cannot be written to the ADi register.

In repeat mode 0, no interrupt request is generated. After the first AD conversion is completed, determine if the A/D conversion time has elapsed by a program.

In one-shot mode, repeat mode 1, single sweep mode, and repeat sweep mode, an interrupt request is generated at certain times, such as when an A/D conversion completes (the IR bit in the ADIC register is set to 1).

However, in repeat mode 1 and repeat sweep mode, A/D conversion continues after an interrupt request is generated. Read the ADi register before the next A/D conversion is completed, since at completion the ADi register is rewritten with the new value.

In one-shot mode and single sweep mode, when bits ADCAP1 to ADCAP0 in the ADMOD register is set to 00b (software trigger), the ADST bit in the ADCON0 register is used to determine whether the A/D conversion or sweep has completed.

During an A/D conversion operation, if the ADST bit in the ADCON0 register is set to 0 (A/D conversion stops) by a program to forcibly terminate A/D conversion, the conversion result of the A/D converter is undefined and no interrupt is generated. The value of the ADi register before A/D conversion may also be undefined.

If the ADST bit is set to 0 by a program, do not use the value of all the ADi register.

### 23.3.5 Low Current Consumption Function

When the A/D converter is not used, power consumption can be reduced by setting the ADSTBY bit in the ADCON1 register to 0 (A/D operation stops (standby)) to shut off any analog circuit current flow.

To use the A/D converter, set the ADSTBY bit to 1 (A/D operation enabled) and wait for 1  $\phi$ AD cycle or more before setting the ADST bit in the ADCON0 register to 1 (A/D conversion starts). Do not write 1 to bits ADST and ADSTBY at the same time.

Also, do not set the ADSTBY bit to 0 (A/D operation stops (standby)) during A/D conversion.

### 23.3.6 On-Chip Reference Voltage (OCVREF)

In one-shot mode, repeat mode 0, and repeat mode 1, the on-chip reference voltage (OCVREF) can be used as analog input.

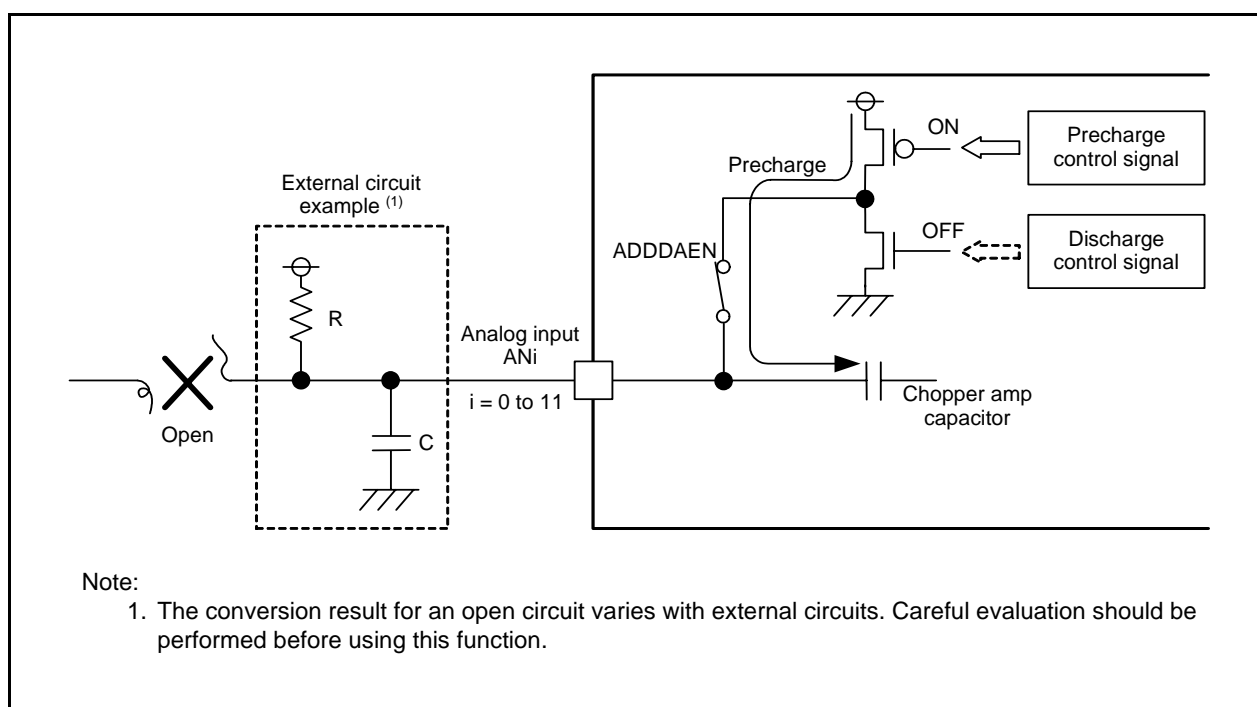

Any variation in VREF can be confirmed using the on-chip reference voltage. Use the ADEX0 bit in the ADCON1 register and the OCVREFAN bit in the OCVREFCR register to select the on-chip reference voltage.

The A/D conversion result of the on-chip reference voltage in one-shot mode or in repeat mode 0 is stored in the AD0 register.

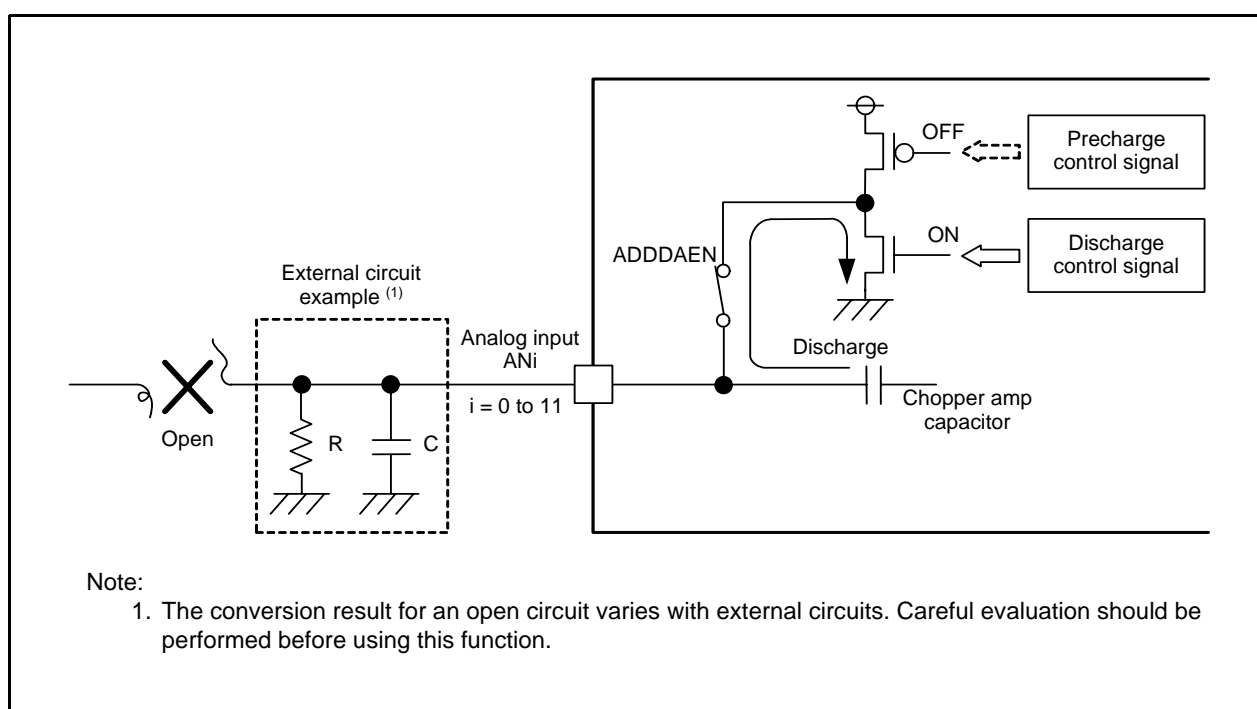

### 23.3.7 A/D Open-Circuit Detection Assist Function

To suppress influences of the analog input voltage leakage from the previously converted channel during A/D conversion operation, a function is incorporated to fix the electric charge on the chopper amp capacitor to the predetermined state (AVCC or GND) before starting conversion.

This function enables more reliable detection of an open circuit in the wiring connected to the analog input pins. Figure 23.5 shows the A/D Open-Circuit Detection Example on AVCC Side (Precharge before Conversion Selected) and Figure 23.6 shows the A/D Open-Circuit Detection Example on AVSS Side (Discharge before Conversion Selected).

**Figure 23.5 A/D Open-Circuit Detection Example on AVCC Side (Precharge before Conversion Selected)**

**Figure 23.6 A/D Open-Circuit Detection Example on AVSS Side (Discharge before Conversion Selected)**

## 23.4 One-Shot Mode

In one-shot mode, the input voltage to one pin selected from among AN0 to AN11 or OCVREF is A/D converted once.

Table 23.4 lists the One-Shot Mode Specifications.

**Table 23.4 One-Shot Mode Specifications**

Item	Specification
Function	The input voltage to the pin selected by bits CH2 to CH0 and bits ADGSEL1 to ADGSEL0 in the ADINSEL register or the ADEX0 bit in the ADCON1 register is A/D converted once.
Resolution	8 bits or 10 bits
A/D conversion start condition	<ul style="list-style-type: none"> <li>• Software trigger</li> <li>• Timer RC</li> <li>• External trigger (Refer to <b>23.3.3 A/D Conversion Start Condition.</b>)</li> </ul>
A/D conversion stop condition	<ul style="list-style-type: none"> <li>• A/D conversion completes (If bits ADCAP1 to ADCAP0 in the ADMOD register are set to 00b (software trigger), the ADST bit in the ADCON0 register is set to 0.)</li> <li>• Set the ADST bit to 0</li> </ul>
Interrupt request generation timing	When A/D conversion completes
Analog input pin	One pin selectable from among AN0 to AN11, or OCVREF.
Storage register for A/D conversion result	AD0 register: AN0, AN8, OCVREF AD1 register: AN1, AN9 AD2 register: AN2, AN10 AD3 register: AN3, AN11 AD4 register: AN4 AD5 register: AN5 AD6 register: AN6 AD7 register: AN7
Reading of result of A/D converter	Read register AD0 to AD7 corresponding to the selected pin.

## 23.5 Repeat Mode 0

In repeat mode 0, the input voltage to one pin selected from among AN0 to AN11 or OCVREF is A/D converted repeatedly.

Table 23.5 lists the Repeat Mode 0 Specifications.

**Table 23.5 Repeat Mode 0 Specifications**

Item	Specification
Function	The input voltage to the pin selected by bits CH2 to CH0 and bits ADGSEL1 to ADGSEL0 in the ADINSEL register or the ADEX0 bit in the ADCON1 register is A/D converted repeatedly.
Resolution	8 bits or 10 bits
A/D conversion start condition	<ul style="list-style-type: none"> <li>• Software trigger</li> <li>• Timer RC</li> <li>• External trigger</li> </ul> (Refer to <b>23.3.3 A/D Conversion Start Condition.</b> )
A/D conversion stop condition	Set the ADST bit in the ADCON0 register to 0
Interrupt request generation timing	Not generated
Analog input pin	One pin selectable from among AN0 to AN11, or OCVREF.
Storage register for A/D conversion result	AD0 register: AN0, AN8, OCVREF AD1 register: AN1, AN9 AD2 register: AN2, AN10 AD3 register: AN3, AN11 AD4 register: AN4 AD5 register: AN5 AD6 register: AN6 AD7 register: AN7
Reading of result of A/D converter	Read register AD0 to AD7 corresponding to the selected pin.

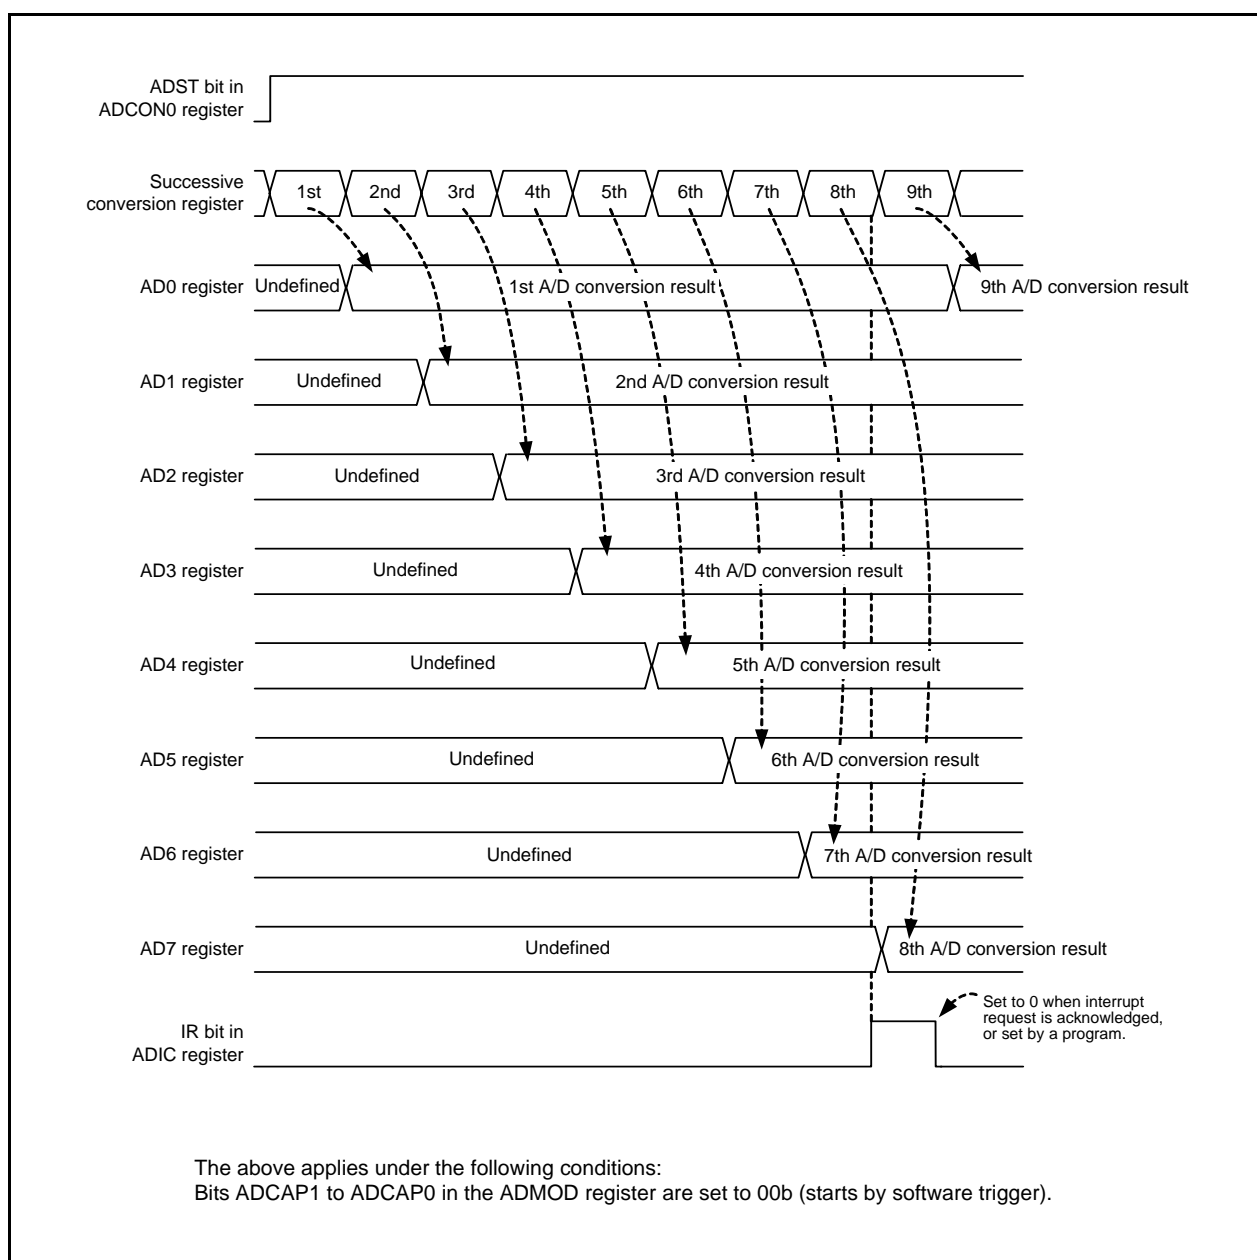

## 23.6 Repeat Mode 1

In repeat mode 1, the input voltage to one pin selected from among AN0 to AN11 or OCVREF is A/D converted repeatedly.

Table 23.6 lists the Repeat Mode 1 Specifications. Figure 23.7 shows the Operating Example of Repeat Mode 1.

**Table 23.6 Repeat Mode 1 Specifications**

Item	Specification
Function	The input voltage to the pin selected by bits CH2 to CH0 and bits ADGSEL1 to ADGSEL0 in the ADINSEL register or the ADEX0 bit in the ADCON1 register is A/D converted repeatedly.
Resolution	8 bits or 10 bits
A/D conversion start condition	<ul style="list-style-type: none"> <li>• Software trigger</li> <li>• Timer RC</li> <li>• External trigger</li> </ul> (Refer to <b>23.3.3 A/D Conversion Start Condition.</b> )
A/D conversion stop condition	Set the ADST bit in the ADCON0 register to 0
Interrupt request generation timing	When the A/D conversion result is stored in the AD7 register.
Analog input pin	One pin selectable from among AN0 to AN11, or OCVREF.
Storage register for A/D conversion result	AD0 register: 1st A/D conversion result, 9th A/D conversion result... AD1 register: 2nd A/D conversion result, 10th A/D conversion result... AD2 register: 3rd A/D conversion result, 11th A/D conversion result... AD3 register: 4th A/D conversion result, 12th A/D conversion result... AD4 register: 5th A/D conversion result, 13th A/D conversion result... AD5 register: 6th A/D conversion result, 14th A/D conversion result... AD6 register: 7th A/D conversion result, 15th A/D conversion result... AD7 register: 8th A/D conversion result, 16th A/D conversion result...
Reading of result of A/D converter	Read registers AD0 to AD7

**Figure 23.7 Operating Example of Repeat Mode 1**

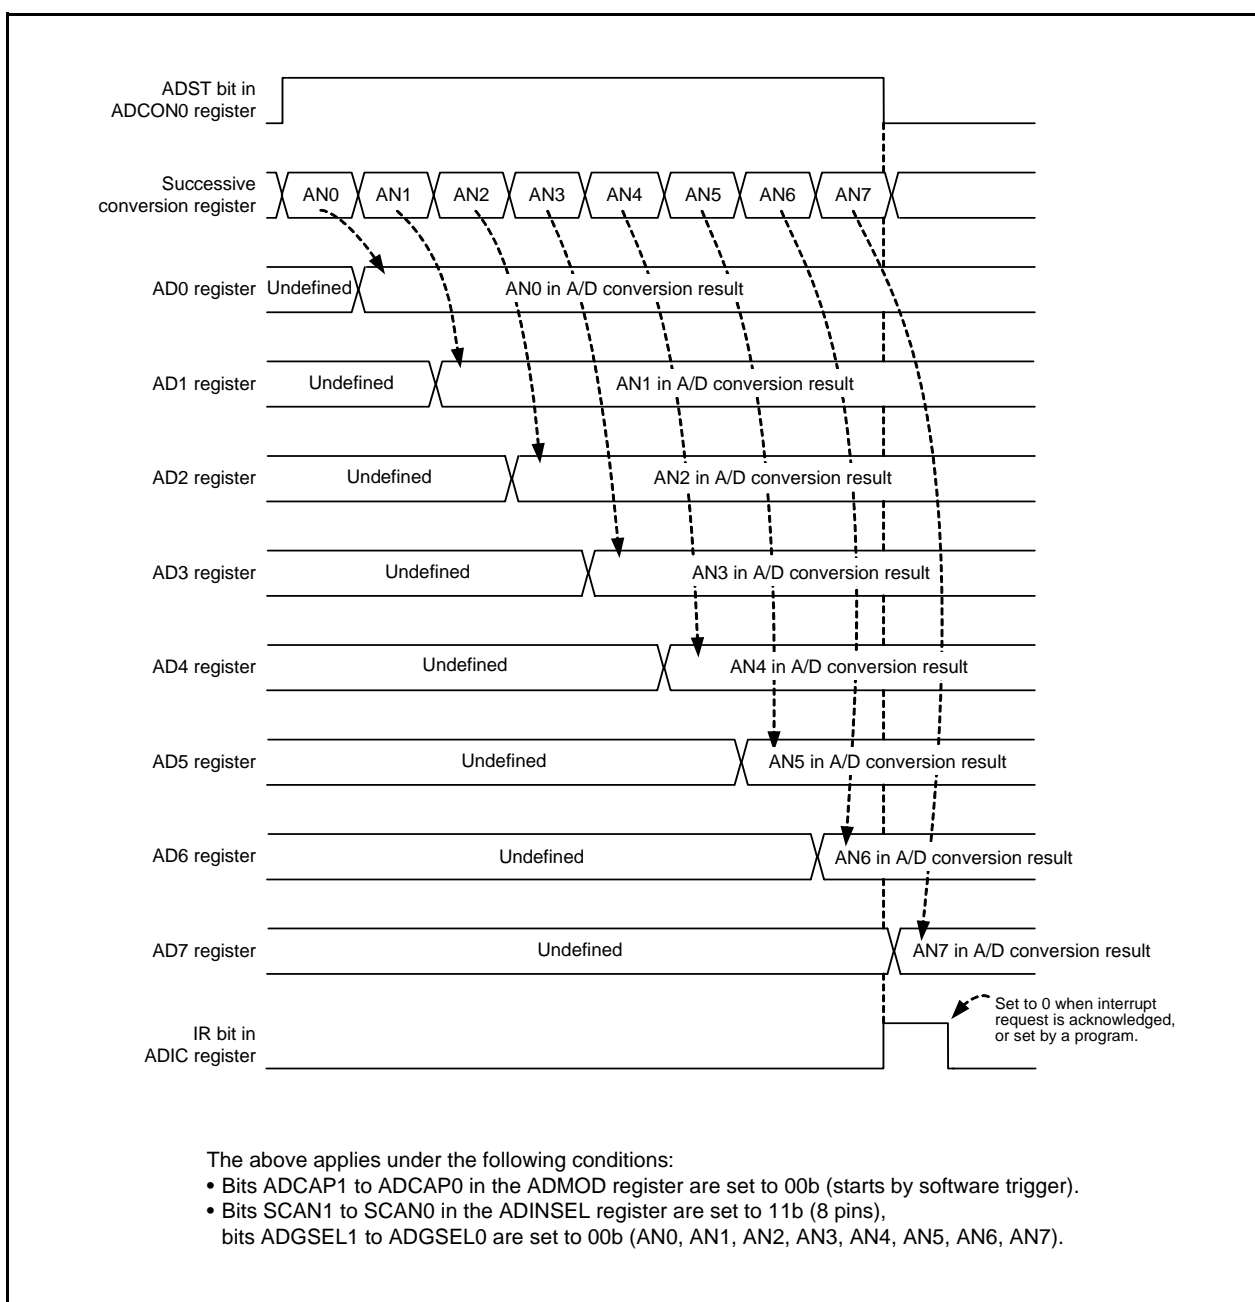

## 23.7 Single Sweep Mode

In single sweep mode, the input voltage to two, four, six, or eight pins selected from among AN0 to AN11 are A/D converted once.

Table 23.7 lists the Single Sweep Mode Specifications. Figure 23.8 shows the Operating Example of Single Sweep Mode.

**Table 23.7 Single Sweep Mode Specifications**

Item	Specification
Function	The input voltage to the pins selected by bits ADGSEL1 to ADGSEL0 and bits SCAN1 to SCAN0 in the ADINSEL register is A/D converted once.
Resolution	8 bits or 10 bits
A/D conversion start condition	<ul style="list-style-type: none"> <li>• Software trigger</li> <li>• Timer RC</li> <li>• External trigger</li> </ul> (Refer to <b>23.3.3 A/D Conversion Start Condition.</b> )
A/D conversion stop condition	<ul style="list-style-type: none"> <li>• If two pins are selected, when A/D conversion of the two selected pins completes (the ADST bit in the ADCON0 register is set to 0).</li> <li>• If four pins are selected, when A/D conversion of the four selected pins completes (the ADST bit is set to 0).</li> <li>• If six pins are selected, when A/D conversion of the six selected pins completes (the ADST bit is set to 0).</li> <li>• If eight pins are selected, when A/D conversion of the eight selected pins completes (the ADST bit is set to 0).</li> <li>• Set the ADST bit to 0.</li> </ul>
Interrupt request generation timing	<ul style="list-style-type: none"> <li>• If two pins are selected, when A/D conversion of the two selected pins completes.</li> <li>• If four pins are selected, when A/D conversion of the four selected pins completes.</li> <li>• If six pins are selected, when A/D conversion of the six selected pins completes.</li> <li>• If eight pins are selected, when A/D conversion of the eight selected pins completes.</li> </ul>
Analog input pin	AN0 to AN1 (2 pins), AN8 to AN9 (2 pins), AN0 to AN3 (4 pins), AN8 to AN11 (4 pins), AN0 to AN5 (6 pins), AN0 to AN7 (8 pins) (Selectable by bits SCAN1 to SCAN0 and bits ADGSEL1 to ADGSEL0.)
Storage register for A/D conversion result	AD0 register: AN0, AN8 AD1 register: AN1, AN9 AD2 register: AN2, AN10 AD3 register: AN3, AN11 AD4 register: AN4 AD5 register: AN5 AD6 register: AN6 AD7 register: AN7
Reading of result of A/D converter	Read the registers from AD0 to AD7 corresponding to the selected pin.

**Figure 23.8 Operating Example of Single Sweep Mode**

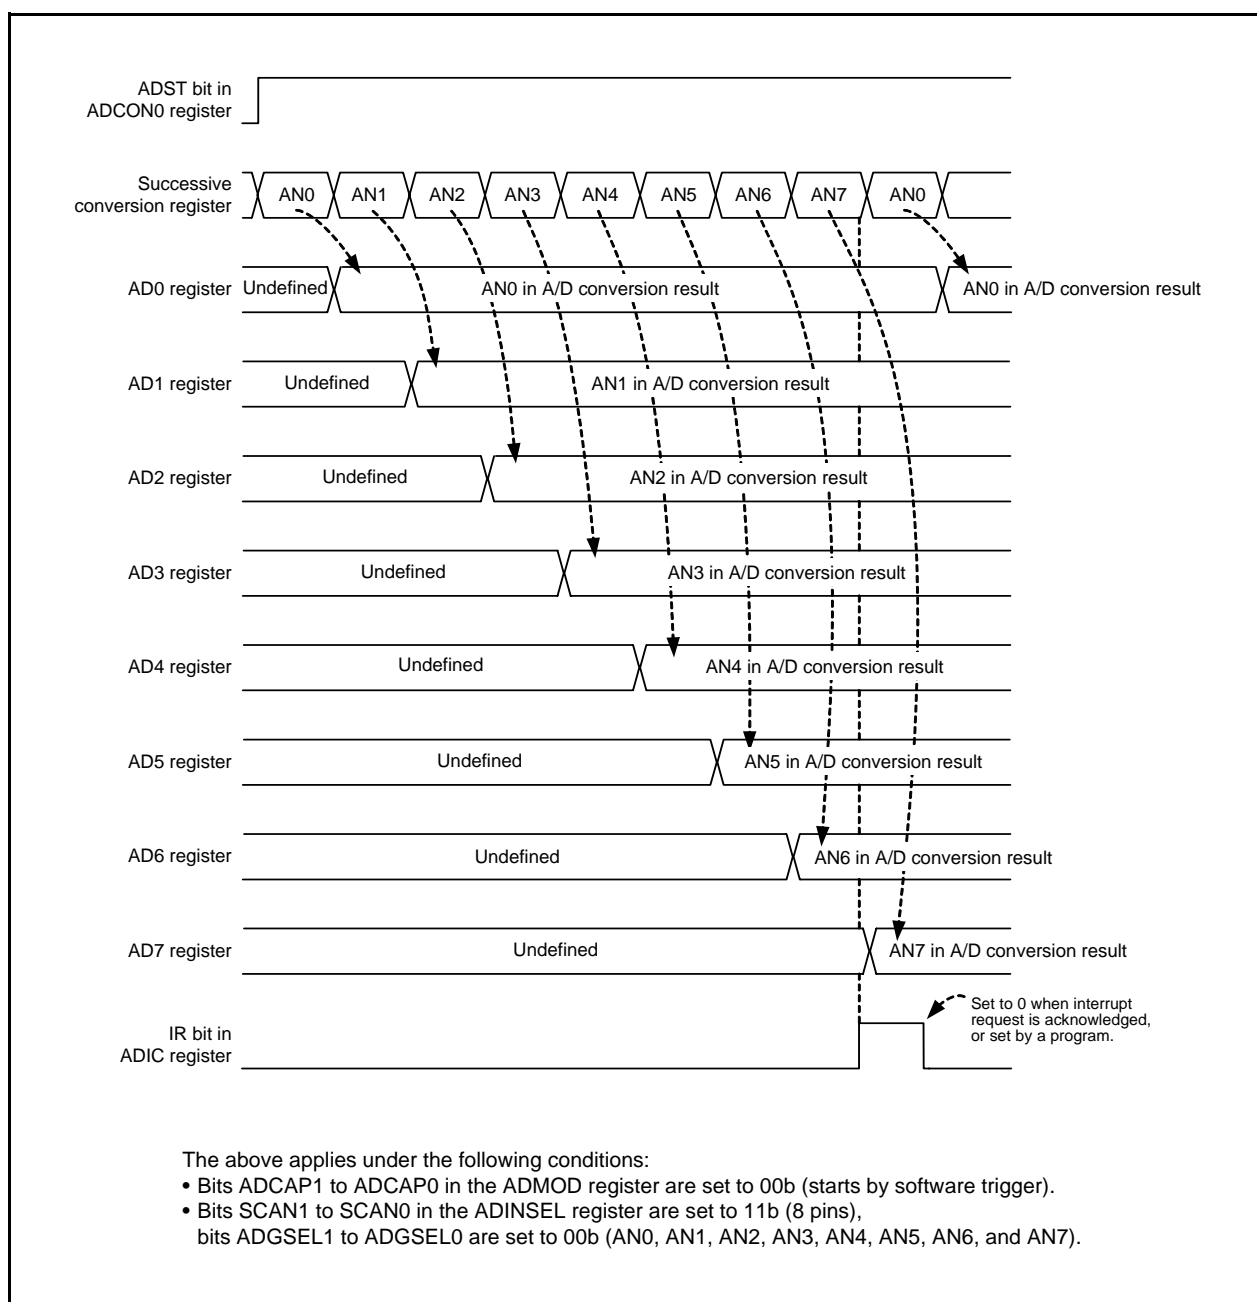

## 23.8 Repeat Sweep Mode

In repeat sweep mode, the input voltage to two, four, six, or eight pins selected from among AN0 to AN11 are A/D converted repeatedly.

Table 23.8 lists the Repeat Sweep Mode Specifications. Figure 23.9 shows the Operating Example of Repeat Sweep Mode.

**Table 23.8 Repeat Sweep Mode Specifications**

Item	Specification
Function	The input voltage to the pins selected by bits ADGSEL1 to ADGSEL0 and bits SCAN1 to SCAN0 in the ADINSEL register are A/D converted repeatedly.
Resolution	8 bits or 10 bits
A/D conversion start condition	<ul style="list-style-type: none"> <li>• Software trigger</li> <li>• Timer RC</li> <li>• External trigger</li> </ul> (Refer to <b>23.3.3 A/D Conversion Start Condition.</b> )
A/D conversion stop condition	Set the ADST bit in the ADCON0 register to 0
Interrupt request generation timing	<ul style="list-style-type: none"> <li>• If two pins are selected, when A/D conversion of the two selected pins completes.</li> <li>• If four pins are selected, when A/D conversion of the four selected pins completes.</li> <li>• If six pins are selected, when A/D conversion of the six selected pins completes.</li> <li>• If eight pins are selected, when A/D conversion of the eight selected pins completes.</li> </ul>
Analog input pin	AN0 to AN1 (2 pins), AN8 to AN9 (2 pins), AN0 to AN3 (4 pins), AN8 to AN11 (4 pins), AN0 to AN5 (6 pins), AN0 to AN7 (8 pins) (Selectable by bits SCAN1 to SCAN0 and bits ADGSEL1 to ADGSEL0.)
Storage register for A/D conversion result	AD0 register: AN0, AN8 AD1 register: AN1, AN9 AD2 register: AN2, AN10 AD3 register: AN3, AN11 AD4 register: AN4 AD5 register: AN5 AD6 register: AN6 AD7 register: AN7
Reading of result of A/D converter	Read the registers from AD0 to AD7 corresponding to the selected pin.

**Figure 23.9 Operating Example of Repeat Sweep Mode**

### 23.9 Output Impedance of Sensor under A/D Conversion

To carry out A/D conversion properly, charging the internal capacitor C shown in Figure 23.10 has to be completed within a specified period of time. T (sampling time) as the specified time. Let output impedance of sensor equivalent circuit be R0, internal resistance of microcomputer be R, precision (error) of the A/D converter be X, and the resolution of A/D converter be Y (Y is 1024 in the 10-bit mode, and 256 in the 8-bit mode).

$$VC \text{ is generally } VC = VIN \left\{ 1 - e^{-\frac{1}{C(R0 + R)} t} \right\}$$

$$\text{And when } t = T, VC = VIN - \frac{X}{Y} VIN = VIN \left( 1 - \frac{X}{Y} \right)$$

$$e^{-\frac{1}{C(R0 + R)} T} = \frac{X}{Y}$$

$$-\frac{1}{C(R0 + R)} T = \ln \frac{X}{Y}$$

$$\text{Hence, } R0 = -\frac{T}{C \cdot \ln \frac{X}{Y}} - R$$

Figure 23.10 shows the Analog Input Pin and External Sensor Equivalent Circuit. When the difference between VIN and VC becomes 0.1LSB, we find impedance R0 when voltage between pins VC changes from 0 to VIN - (0.1/1024) VIN in time T. (0.1/1024) means that A/D precision drop due to insufficient capacitor charge is held to 0.1LSB at time of A/D conversion in the 10-bit mode. Actual error however is the value of absolute precision added to 0.1LSB.

T = 0.75 μs when φAD = 20 MHz. Output impedance R0 for sufficiently charging capacitor C within time T is determined as follows.

T = 0.75 μs, R = 10 kΩ, C = 6.0 pF, X = 0.1, and Y = 1024. Hence,

$$R0 = -\frac{0.75 \times 10^{-6}}{6.0 \times 10^{-12} \cdot \ln \frac{0.1}{1024}} - 10 \times 10^3 \approx 3.5 \times 10^3$$

Thus, the allowable output impedance of the sensor equivalent circuit, making the precision (error) 0.1LSB or less, is approximately 3.5 kΩ maximum.

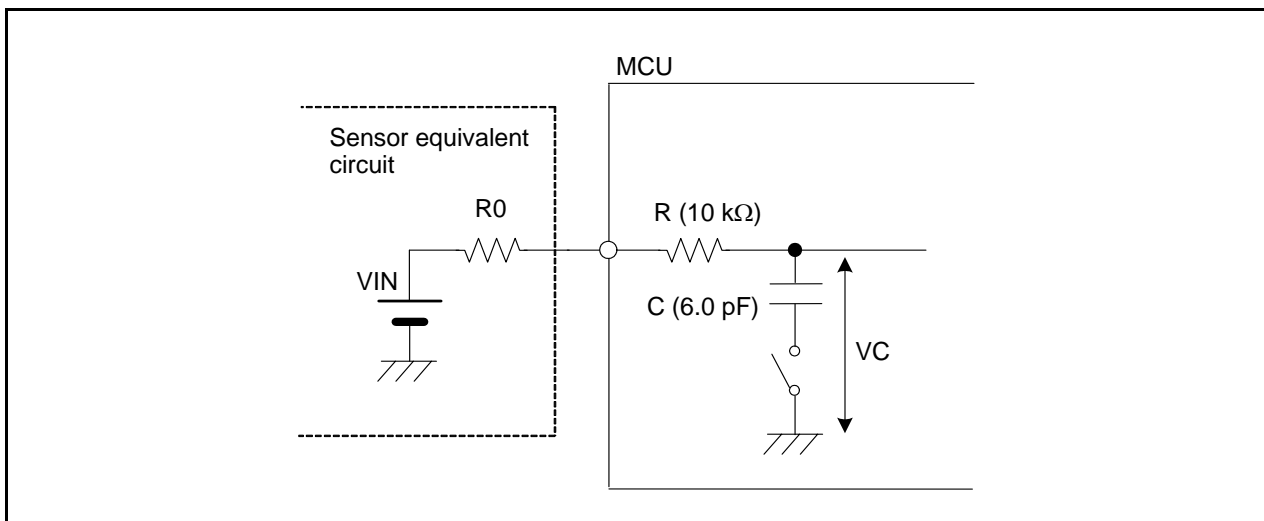

Figure 23.10 Analog Input Pin and External Sensor Equivalent Circuit

### 23.10 Notes on A/D Converter

- Write to the ADMOD register, the ADINSEL register, the ADCON0 register (other than ADST bit), the ADCON1 register, the OCVREFCR register when A/D conversion is stopped (before a trigger occurs).
- To use the A/D converter in repeat mode 0, repeat mode 1, or repeat sweep mode, select the frequency of the A/D converter operating clock  $\phi_{AD}$  or more for the CPU clock during A/D conversion.  
Do not select fOCO-F as  $\phi_{AD}$ .
- Connect 0.1  $\mu$ F capacitor between the VREF pin and AVSS pin.
- Do not enter stop mode during A/D conversion.
- Do not enter wait mode during A/D conversion regardless of the state of the CM02 bit in the CM0 register (1: Peripheral function clock stops in wait mode or 0: Peripheral function clock does not stop in wait mode).
- Do not set the FMSTP bit in the FMR0 register to 1 (flash memory stops) or the FMR27 bit to 1 (low-consumption-current read mode enabled) during A/D conversion. Otherwise, the A/D conversion result will be undefined.
- Do not change the CKS2 bit in the ADMOD register while fOCO-F is stopped.
- During an A/D conversion operation, if the ADST bit in the ADCON0 register is set to 0 (A/D conversion stops) by a program to forcibly terminate A/D conversion, the conversion result of the A/D converter is undefined and no interrupt is generated. The value of the ADi register before A/D conversion may also be undefined.  
If the ADST bit is set to 0 by a program, do not use the value of all the ADi register.

## 24. Sensor Control Unit

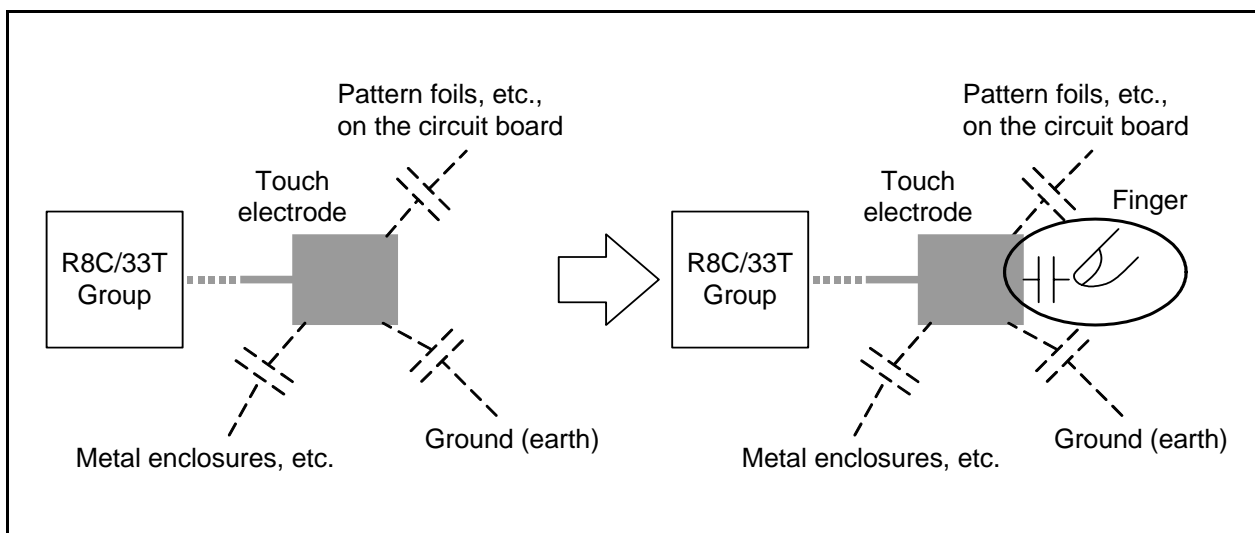

The sensor control unit (SCU) is a function to control the capacitive touch electrode.

The unit measures the floating capacitance of the touch electrode connected to the measurement pin.

As shown in Figure 24.1, there exist electrostatic capacitances between the electrode and the surrounding conductors. Because the human body is an electrical conductor, when a finger is placed close to the electrode, the value of the floating capacitance increases.

The sensor control unit detects the increase in floating capacitance to determine whether the electrode is being touched or not.

For details of the measurement operation principle of the unit's capacitive touch electrode, refer to **24.4 Principle of Measurement Operation**.

**Figure 24.1 Increased Floating Capacitance due to Presence of Finger**

## 24.1 Overview

Figure 24.2 shows a Block Diagram of Sensor Control Unit.

As shown in Figure 24.2, the sensor control unit consists of the status counter, the secondary counter, and the primary counter.

The unit controls the ports, the counters, and data transfer to detect the floating capacitance of the capacitive touch electrode.

The operating clock for the sensor control unit is f1, f2 or f4, which selected as the count source. The count source is supplied to each counter.

The sensor control unit has the following two operating modes:

- Single mode: Touches on a channel are detected.
- Scan mode: Touches on any multiple channels are detected.

## 24.2 Registers

### 24.2.1 SCU Control Register 0 (SCUCR0)

Address 02C0h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	SCUIE	BCSHORT	SCCLK1	SCCLK0	—	SCINIT	SCUE	SCSTRT
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	SCSTRT	Measurement start bit	0: Measurement stops 1: Measurement starts	R/W
b1	SCUE	SCU operation enable bit	0: Operation disabled <sup>(1)</sup> 1: Operation enabled	R/W
b2	SCINIT	SCU control block initialize bit	Writing 1 to this bit initializes the SCU control block and the registers. <sup>(2)</sup>	R/W
b3	—	Reserved bit	Set to 0.	R/W
b4	SCCLK0	Count source select bit	<sup>b5 b4</sup> 0 0: f1 0 1: f2 1 0: f4 1 1: Do not set.	R/W
b5	SCCLK1			R/W
b6	BCSHORT	CHxB-CHxC short select bit	0: No shorted (The shorting switch is always turned OFF.) 1: Shortened (The shorting switch is turned ON in Status 7 and 14, and turned OFF in Status 4, 11, and 18. The switch is turned ON in Status 6 and 15, and turned OFF in Status 11.)	R/W
b7	SCUIE	SCU interrupt enable bit	0: SCU interrupt disabled 1: SCU interrupt enabled	R/W

Notes:

1. The SCUE bit is not set to 0 (operation disabled) even if the SCSTRT bit is set to 0 (measurement stops), or even if the SCINIT bit is set to 1 (initialized). The SCUE bit is not also set to 0 even if an interrupt request is generated after a measurement finishes. Set this bit to 0 by a program.
2. The following are initialized:
  - Registers SCUSTC, SCUHC, SCUPRC, SCUSCC, SCUDBR, and SCUFR
  - The SCSTRT bit in the SCUCR0 register
  - The SCU control block (data transfer destination address register and SCU timing control counter)

#### SCSTRT Bit (Measurement Start Bit)

[Conditions for setting to 0]

- Set this bit to 0 by a program (forced stop).
- When an interrupt request is generated after a measurement finishes.
- When 1 is written to the SCINIT bit.

[Condition for setting to 1]

Set to 1 by a program.

When the SCSTRT bit is set to 0 (measurement stops) while bits SCCAP1 to SCCAP0 in the SCUMR register are 0 (software trigger), the value of each counter is retained. When the SCSTRT bit is set to 1 (measurement starts), measurement starts from the status where the measurement is stopped.

When a trigger from timer RC or external trigger (SCUTRG) is selected, if the trigger occurs after the SCSTRT bit is set to 0 (measurement stops), measurement starts from Status 1.

#### SCUE Bit (SCU Operation Enable Bit)

When the SCUE bit is set to 1 (operation enabled), the states will change to as follows:

- The analog path between the CHxB-CHxC path is disconnected (the disconnecting switch is turned OFF).
- The analog channel control decoder is switched for the sensor control unit.
- The analog switch for CHxA is forcibly turned ON.

### 24.2.2 SCU Mode Register (SCUMR)

Address 02C1h

Bit	b7	b6	b5	b4	b3	b2	b1	b0

Bit	Symbol	Bit Name	Function	R/W
b0	DTSR	Data transfer status flag	[Conditions for setting to 0] • When data transfer to RAM is completed. • Write 1 to the SCUINIT bit in the SCUCR0 register. <sup>(1)</sup> [Condition for setting to 1] When data A is captured to the buffer.	R
b1	OVFER	Overflow error flag	[Conditions for setting to 0] • Write 1 to the SCUINIT bit in the SCUCR0 register. <sup>(1)</sup> • Write 0 by a program. <sup>(1)</sup> [Condition for setting to 1] When the primary counter overflows.	R/W
b2	EWMER	Exit from wait mode error flag	[Conditions for setting to 0] • Write 1 to the SCUINIT bit in the SCUCR0 register. • Write 0 by a program. <sup>(1)</sup> [Condition for setting to 1] When the MCU exits wait mode during the measurement of the touch sensor in wait mode.	R/W
b3	MVF	SCU operation flag	0: Sensor control unit is stopped 1: Sensor control unit is in operation	R
b4	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b5	—			
b6	—			
b7	SIF	SCU interrupt request flag	[Condition for setting to 0] Write 0 after read. <sup>(2)</sup> [Condition for setting to 1] When a measurement of the touch sensor is completed.	R/W

Notes:

- When the SCSTRT bit in the SCUCR0 register is set to 0 (measurement stops), the DTSR bit is not set to 0.
- The writing results are as follows:
  - This bit is set to 0 when the read result is 1 and 0 is written to the same bit.
  - This bit remains unchanged even if the read result is 0 and 0 is written to the same bit. (This bit remains 1 even if it is set to 1 from 0 after reading, and writing 0.)
  - This bit remains unchanged if 1 is written to it.

#### EWMER Bit (Exit from Wait Mode Error Flag)

This error flag indicates when the MCU exits wait mode during the measurement of the touch sensor in wait mode.

### 24.2.10 SCU Status Counter (SCUSTC)

Address 02C9h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	SSQ4	SSQ3	SSQ2	SSQ1	SSQ0
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
b0	SSQ0	Status counter for the sensor control unit.	R/W
b1	SSQ1	The value changes to 00000b in the following cases: • When an interrupt request is acknowledged after a measurement of the touch sensor finishes. • Write 1 to the SCUINIT bit in the SCUCR0 register.  When the SCSTRT bit in the SCUCR0 register is set to 0 (measurement stops), the value remains unchanged (the value does not change to 00000b).	R/W
b2	SSQ2		R/W
b3	SSQ3		R/W
b4	SSQ4		R/W

### 24.2.16 Touch Sensor Input Enable Register 0 (TSIER0)

Address 02DCh

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	CH07E	CH06E	CH05E	CH04E	CH03E	CH02E	CH01E	CH00E
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	CH00E	CH0 enable bit	0: Disabled (used as an I/O port) 1: Enabled (used as a touch sensor pin)	R/W
b1	CH01E	CH1 enable bit		R/W
b2	CH02E	CH2 enable bit		R/W
b3	CH03E	CH3 enable bit		R/W
b4	CH04E	CH4 enable bit		R/W
b5	CH05E	CH5 enable bit		R/W
b6	CH06E	CH6 enable bit		R/W
b7	CH07E	CH7 enable bit		R/W

The TSIER0 register is enabled when the SCUE bit in the SCUCR0 register is set to 1 (operation enabled).

In scan mode, for the CH range set by the CHCi bit (i = 0 to 4) in the SCHCR register, even when a corresponding enable bit is disabled, the bit is measured and its data is stored. However, the data is invalid.

### 24.2.17 Touch Sensor Input Enable Register 1 (TSIER1)

Address 02DDh

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	CH15E	CH14E	CH13E	CH12E	CH11E	CH10E	CH09E	CH08E
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	CH08E	CH8 enable bit	0: Disabled (used as an I/O port) 1: Enabled (used as a touch sensor pin)	R/W
b1	CH09E	CH9 enable bit		R/W
b2	CH10E	CH10 enable bit		R/W
b3	CH11E	CH11 enable bit		R/W
b4	CH12E	CH12 enable bit		R/W
b5	CH13E	CH13 enable bit		R/W
b6	CH14E	CH14 enable bit		R/W
b7	CH15E	CH15 enable bit		R/W

The TSIER1 is enabled when the SCUE bit in the SCUCR0 register is set to 1 (operation enabled).

### 24.2.18 Touch Sensor Input Enable Register 2 (TSIER2)

Address 02DEh

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	—	—	—	—	—	—	CH17E	CH16E
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	CH16E	CH16 enable bit	0: Disabled (used as an I/O port)	R/W
b1	CH17E	CH17 enable bit	1: Enabled (used as a touch sensor pin)	R/W
b2	—	Reserved bits	Set to 0.	R/W
b3	—			
b4	—			
b5	—			
b6	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b7	—			

The TSIER2 register is enabled when the SCUE bit in the SCUCR0 register is set to 1 (operation enabled).  
 In scan mode, for the CH range set by the CHCi bit (i = 0 to 4) in the SCHCR register, even when a corresponding enable bit is disabled, the bit is measured and its data is stored. However, the data is invalid.

## 24.3 Functional Description

### 24.3.1 Common Items for Multiple Modes

#### 24.3.1.1 Status Counter

The status counter operation is divided into the measurement STEP1 and STEP2. When “L” at CHxA is detected in measurement STEP1, the counter proceeds to the measurement STEP2. There are variable periods to improve the accuracy of measurement. The status counter operates for measurement of each channel while repeating Status 0 to 23.

Table 24.10 lists the Status.

Table 24.10 Status

Status Counter					Status	Pin State			Re- peat	Operation
SSQ4	SSQ3	SSQ2	SSQ1	SSQ0		CHxC	CHxB	CHxA		
0	0	0	0	0	0	Hi-Z	Hi-Z	Hi-Z		Stopped, initial setting
0	0	0	0	1	1	Hi-Z	Hi-Z	Hi-Z		Transfer of setting values
0	0	0	1	0	2	"H"	Hi-Z	Hi-Z		Variable period 1 (1 to 128 cycles) selected by bits TCS10 to TCS16, charging period
0	0	0	1	1	3	Hi-Z	Hi-Z	Hi-Z		Initialization
0	0	1	0	0	4	Hi-Z	Hi-Z	"L"		Variable period 2 (1 to 16 cycles) selected by bits TCS20 to TCS23 Can be skipped by the TCS2C bit
0	0	1	0	1	5	Hi-Z	"L"	"L"		Variable period 3 (1 to 4 cycles) selected by bits TCS30 and TCS31
0	0	1	1	0	6	Hi-Z	Hi-Z	Hi-Z		Variable period 4 (1 to 8 cycles) selected by bits TCS40 to TCS42 CHxB-CHxC short can be turned ON by the BCSHORT bit
0	0	1	1	1	7	Hi-Z	Hi-Z	Hi-Z		Dummy cycle
0	1	0	0	0	8	Hi-Z	Hi-Z	Hi-Z		Variable period 5 (1 to 16 cycles) selected by bits TCS50 to TCS53 Can be skipped by the TCS5C bit
0	1	0	0	1	9	Hi-Z	Hi-Z	Hi-Z		Main measurement period
0	1	0	1	0	10	Hi-Z	Hi-Z	Hi-Z		Judging period for Main measurement
0	1	0	1	1	11	Hi-Z	Hi-Z	Hi-Z		Variable period 6 (1 to 16 cycles) selected by bits TCS60 to TCS63 CHxB-CHxC short can be turned OFF by the BCSHORT bit
0	1	1	0	0	12	Hi-Z	Hi-Z	Hi-Z		Dummy cycle
0	1	1	0	1	13	Hi-Z	Hi-Z	"L"		Variable period 2 (1 to 16 cycles) selected by bits TCS20 to TCS23 Can be skipped by the TCS2C bit
0	1	1	1	0	14	Hi-Z	"L"	"L"		Variable period 3 (1 to 4 cycles) selected by bits TCS30 and TCS31
0	1	1	1	1	15	Hi-Z	Hi-Z	Hi-Z		Variable period 4 (1 to 8 cycles) selected by bits TCS40 to TCS42 CHxB-CHxC short can be turned ON by the BCSHORT bit
1	0	0	0	0	16	Hi-Z	Hi-Z	Hi-Z		Dummy cycle
1	0	0	0	1	17	Hi-Z	Hi-Z	Hi-Z		Variable period 5 (1 to 16 cycles) selected by bits TCS50 to TCS53 Can be skipped by the TCS5C bit
1	0	0	1	0	18	Hi-Z	Hi-Z	Hi-Z		Main measurement period
1	0	0	1	1	19	Hi-Z	Hi-Z	Hi-Z		Judging period for Main measurement
1	0	1	0	0	20	Hi-Z	Hi-Z	Hi-Z		Judging of the secondary counter value (n = 0?) Variable period 6 (1 to 16 cycles) selected by bits TCS60 to TCS63 CHxB-CHxC short can be turned OFF by the BCSHORT bit
1	0	1	0	1	21	Hi-Z	Hi-Z	Hi-Z		DTC activation request or SDMA transfer request
1	0	1	1	0	22	Hi-Z	Hi-Z	Hi-Z		
1	0	1	1	1	23	Hi-Z	Hi-Z	Hi-Z		Branch to check whether all the channels selected by bits CHC0 to CHC4 are measured
1	1	0	0	0	24	Hi-Z	Hi-Z	Hi-Z		Wait until data transfer to RAM is completed
1	1	0	0	1	25	Hi-Z	Hi-Z	Hi-Z		Sensor control unit interrupt generated
0	0	0	0	0	0	Hi-Z	Hi-Z	Hi-Z		End

BCSHORT: Bit in SCUCR0 register

TCS10 to TCS16, TCS2C: Bits in SCTCR0 register

TCS20 to TCS23, TCS30, TCS31: Bits in SCTCR1 register

TCS40 to TCS42, TCS5C, TCS50 to TCS53: Bits in SCTCR2 register

TCS60 to TCS63: Bits in SCTCR3 register

CHC0 to CHC4: Bits in SCHCR register

### 24.3.1.2 Adjustment of Status Periods

The timing of status periods can be adjusted as shown in Figure 24.3.

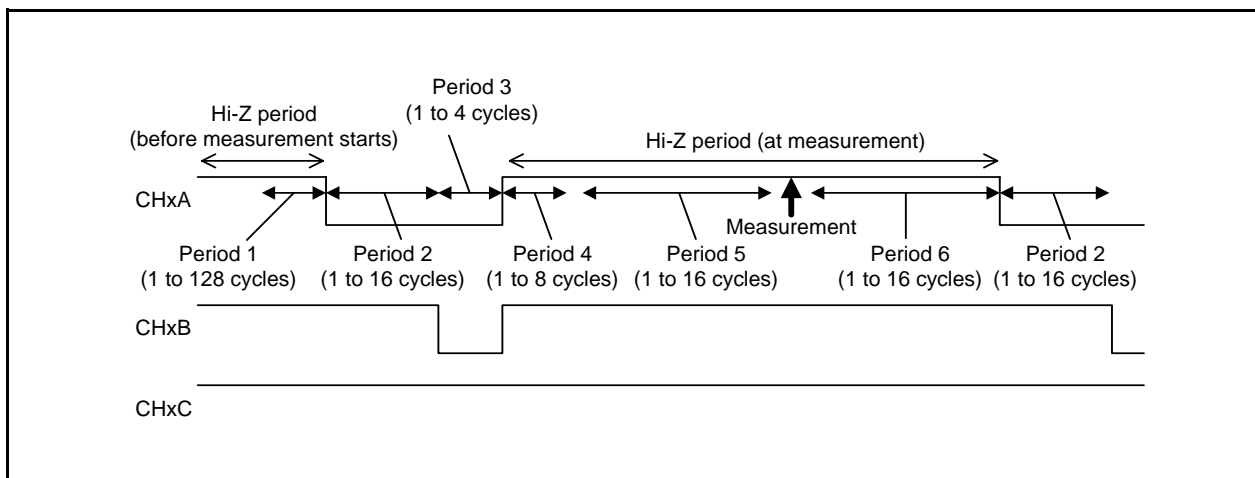

Figure 24.3 Adjustment of Status Periods

### 24.3.1.3 Counter Operation

The primary counter is a 16-bit up counter and the secondary counter is a 5-bit up/down counter.

The primary counter starts decrementing from the count value of “H” measured on each channel, and the secondary counter starts decrementing from the value set by bits SCSCS0 to SCSCS4 in the SCSCSR register each time “L” is detected.

Measurement data is comprised of the primary counter value when “L” is detected for the first time and when the secondary counter value reaches 0. This secondary counter operates in measurement STEP2, and increments the value when “L” is detected and decrements the value when “H” is detected. However, the increment operation causes no count exceeding the value set by bits SCSCS0 to SCSCS4.

Table 24.11 lists the Image of Counter Operation and Measurement Data.

### 24.3.1.4 Measurement Data

Table 24.11 lists the Image of Counter Operation and Measurement Data.

The primary counter values when “L” is detected for the first time and when the secondary counter value reaches 0 are stored at given RAM addresses. When one round of measurement is completed, the measurement data is transferred as 4-byte data combined with data 1 and data 2.

When the CPU operates, data is transferred using the DTC. In wait mode, data is transferred using the SDMA integrated in the sensor control unit. The destination RAM addresses are stored in the DTDARj (j = 0 to 23) register and the SCUDAR register. For details of the DTC settings, refer to **15. DTC**.

**Table 24.11 Image of Counter Operation and Measurement Data**

	Judging Value	Primary Counter Value	Secondary Counter Value	
↑ Measurement STEP 1 ↓	H	95	7	
	H	96	7	
	H	97	7	
	H	98	7	
	H	99	7	
↑ Measurement STEP 2 ↓	L	100	7	← Data 1
	L	100	6	
	H	101	7	
	H	102	7	
	H	103	7	
	H	104	7	
	H	105	7	
	H	106	7	
	H	107	7	
	L	107	6	
	L	107	5	
	L	107	4	
	L	107	3	
	L	107	2	
	L	107	1	
	H	108	2	
	L	108	1	
	L	108	0	← Data 2

### 24.3.1.5 Measurement Channels

For CHxA, CHxB, and CHxC, and target channels from CH0 to CH17, set the corresponding direction bits in the PDi (i = 0 to 4) register to 0 (input mode). However, note that the content of the corresponding port bit in the Pi register is undefined.

Touches are detected at the CHxA (P0\_2) pin. Set the threshold value for touch detection using bits VLT00 and VLT01 in the VLT0 register. For details of the I/O port settings, refer to **7. I/O Ports**.

### 24.3.1.6 Touch Detection Start Conditions

- Software Trigger

When bits SCCAP1 to SCCAP0 in the SCUMR register are set to 00b, a software trigger is selected. Detection starts when the SCSTRT bit in the SCUCR0 register is set to 1 (measurement starts).

- Trigger from Timer RC

When bits SCCAP1 to SCCAP0 in the SCUMR register are set to 10b, a measurement start trigger from timer RC is selected.

To use the measurement start trigger from timer RC, make the following settings:

- Set bits SCCAP1 to SCCAP0 in the SCUMR register to 10b (measurement start trigger from timer RC).
- Use timer RC in the output compare function (timer mode, PWM mode, or PWM2 mode).
- Set the ADTRGjE bit (j = A, B, C, or D) in the TRCADCR register to 1 (SCU trigger occurs at compare match between TRC and TRCGRj register).
- Set the SCSTRT bit in the SCUCR0 register to 1 (measurement starts).

After making the above settings, touch detection starts when the IMFj bit in the TRCSR register changes from 0 to 1.

For details of the timer RC output compare function (timer mode, PWM mode, or PWM2 mode), refer to **19. Timer RC**, **19.5 Timer Mode (Output Compare Function)**, **19.6 PWM Mode**, and **19.7 PWM2 Mode**.

- External Trigger

When bits SCCAP1 to SCCAP0 in the SCUMR register are set to 11b, an external trigger ( $\overline{\text{SCUTRG}}$ ) is selected.

To use the external trigger ( $\overline{\text{SCUTRG}}$ ), make the following settings:

- Set bits SCCAP1 to SCCAP0 in the SCUMR register to 11b (external trigger ( $\overline{\text{SCUTRG}}$ )).
- Set the INT3EN bit in the INTEN register to 1 (enabled).
- Set the PD3\_3 bit in the PD3 register to 0 (input mode).
- Set the SCSTRT bit in the SCUCR0 register to 1 (measurement starts).

After making the above settings, touch detection starts when the input to the  $\overline{\text{SCUTRG}}$  pin is changed from “H” to “L”.

### 24.3.2 Specifications and Operation Example of Sensor Control Unit

Table 24.12 lists the Sensor Control Unit Specifications.

**Table 24.12 Sensor Control Unit Specifications**

Item		Specification
Operating clock (count source)		f1, f2, or f4 (Set the operating clock for the sensor control unit to 4 MHz or 5 MHz.)
Pins	Touch detection	18 channels (CH0 to CH17)
	System pins	3 channels (CHxA, CHxB, and CHxC)
Operating modes	Single mode	Touches are detected on a channel. <ul style="list-style-type: none"> <li>• Set the SCUMD bit in the SCHCR register to 0.</li> <li>• Select any channel by bits CHC0 to CHC4 in the SCHCR register.</li> <li>• Set any channel to be measured to 1 (enabled) by the corresponding enable bit in the TSIERi (i = 0 to 2) register.</li> </ul>
	Scan mode	Touches are detected on any multiple channels. Ascending or descending can be selected as a channel scan order. <ul style="list-style-type: none"> <li>• Set the SCUMD bit in the SCHCR register to 1.</li> <li>• Select 0 (ascending order) or 1 (descending order) by the UPDOWN bit in the SCHCR register.</li> <li>• Determine the maximum number of channels arbitrarily selected bits CHC0 to CHC4 in the SCHCR register.</li> <li>• Set any channels to be measured to 1 (enabled) by the corresponding enable bit in the TSIERi (i = 0 to 2) register.</li> </ul>
Number of detections		One time
Detection threshold value		Touches are detected at the CHxA (P0_2) pin. <ul style="list-style-type: none"> <li>• Set the detection threshold value using bits VLT00 and VLT01 in the VLT0 register.</li> </ul>
Detection data transfer method	During CPU operation	Transfer via the DTC Refer to <b>15. DTC</b> for the settings.
	In wait mode	Transfer via the SDMA in the sensor control unit
Address to store detection data		RAM area <ul style="list-style-type: none"> <li>• Set the start address in the SCUDAR register.</li> <li>• Set the same start address in the DTDARj (j = 0 to 23) register of the DTC.</li> </ul>
Detection start conditions		<ul style="list-style-type: none"> <li>• Software trigger</li> <li>• Measurement start trigger from timer RC</li> <li>• External trigger (SCUTRG)</li> </ul>
Detection stop conditions		<ul style="list-style-type: none"> <li>• When an interrupt request is generated after touch detection and data transfer are completed.</li> <li>• Set the SCSTRT bit in the SCUCR0 register to 0 by a program.</li> </ul> (If detection is stopped by a program, the value of each counter is retained and not changed to the value after reset.)

### 24.3.2.1 Operation Example

A detection operation example of the sensor control unit is shown in Figure 24.4.

Detecting “L” at CHxA for the first time leads to transition from the measurement STEP1 to STEP2. The secondary counter operates after the transition to the measurement STEP2.

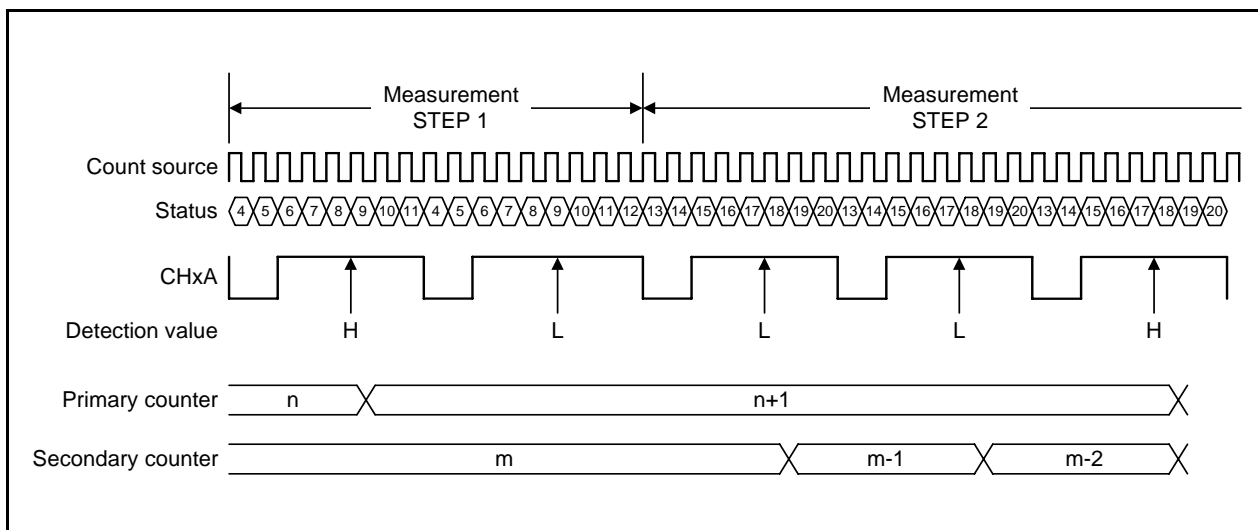

Figure 24.4 Detection Operation Example of Sensor Control Unit

## 24.4 Principle of Measurement Operation

Figure 24.5 shows the Measurement Circuit Section. The measurement operation principle of the sensor touch control unit is explained below.

As shown in Figure 24.5, the operation is described with resistors and capacitors inserted.

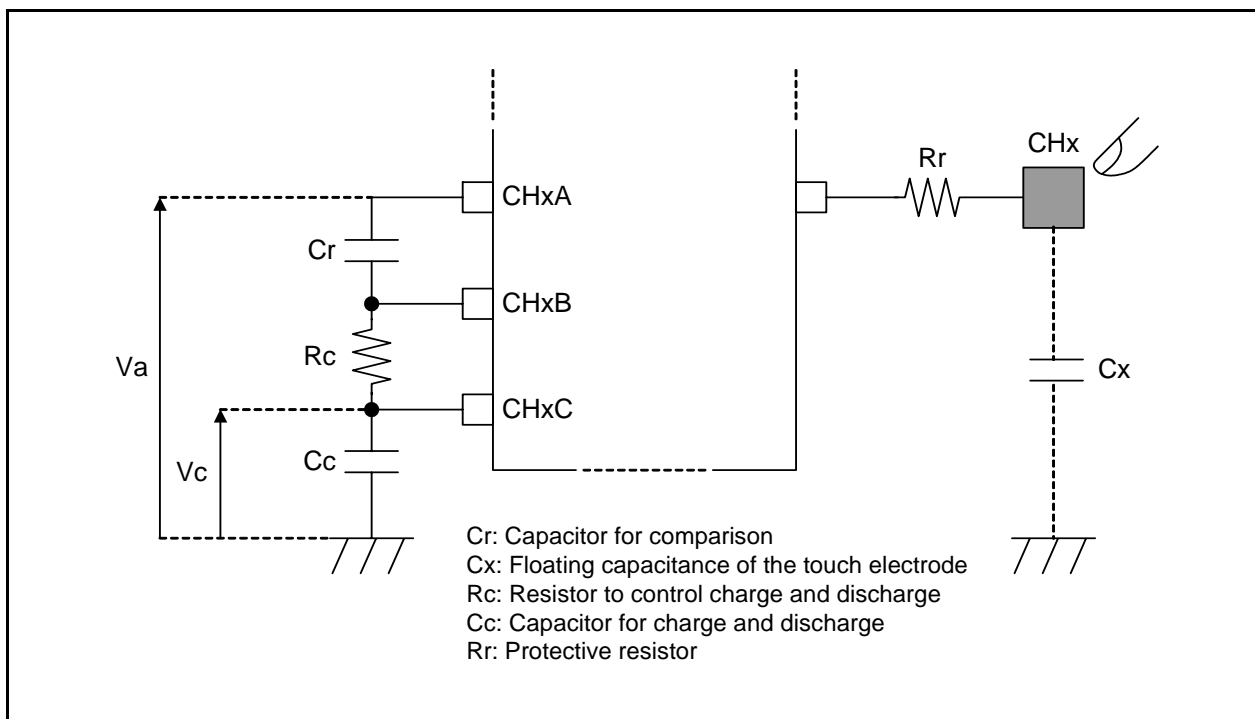

Figure 24.5 Measurement Circuit Section

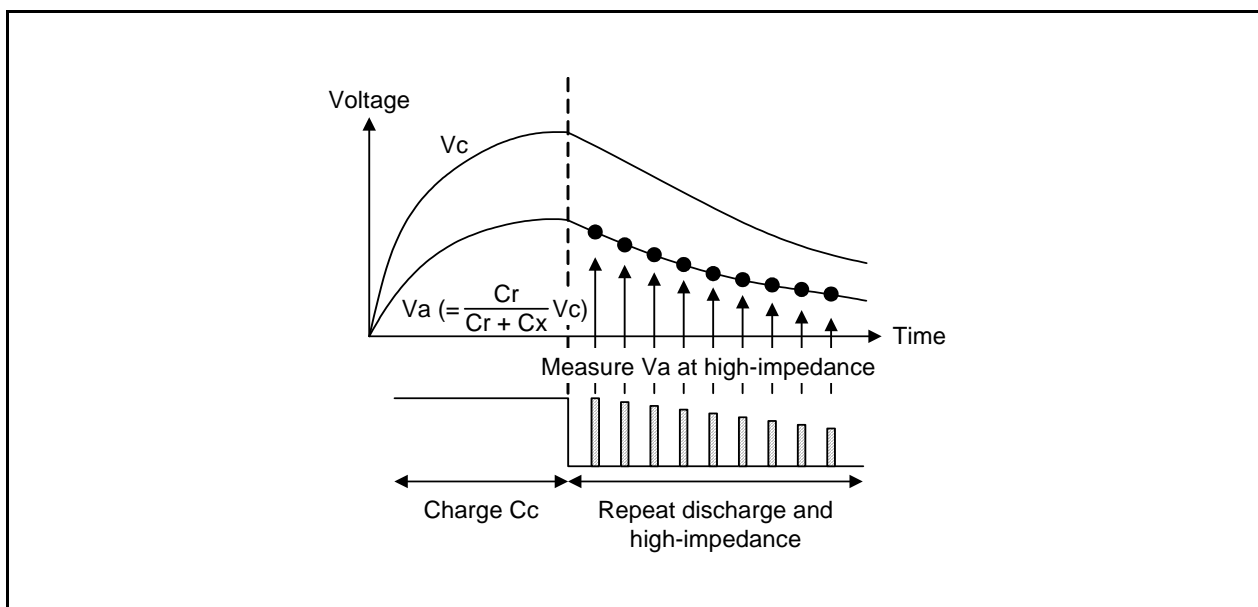

The capacitance of the touch electrode is measured by measuring the voltage at CHxA while gradually discharging the electric charge stored in Cc. Measurement can be executed with the following steps:

- (1) Charge Cc by connecting the CHxC pin to the voltage supply (VCC).
- (2) After charging Cc fully, discharge Cc by connecting pins CHxA and CHxB to the ground level (VSS).
- (3) After discharging Cc for a short period of time, keep pins CHxA and CHxB at high-impedance (Hi-Z), and measure the voltage at the CHxA pin. At this point, as shown in Figure 24.5, when the voltage measured at the CHxA pin is Va, and the voltage measured at the CHxC pin is Vc, Va at the time of voltage measurement is expressed by the following formula (A).

The Time-dependent Variation of Va and Vc is shown in Figure 24.6.

$$V_a = \frac{C_r}{C_r + C_x} V_c \dots \dots \text{formula (A)}$$

- (4) Repeat steps (2) and (3).
- (5) Set an input level for the CHxA pin using the VLT0 register (input threshold value control register 0). Count the number of discharges before Va falls below the input threshold value. Continue counting until the secondary counter reaches 0.
- (6) The count value is comprised of the primary counter value of data 1 and data 2.

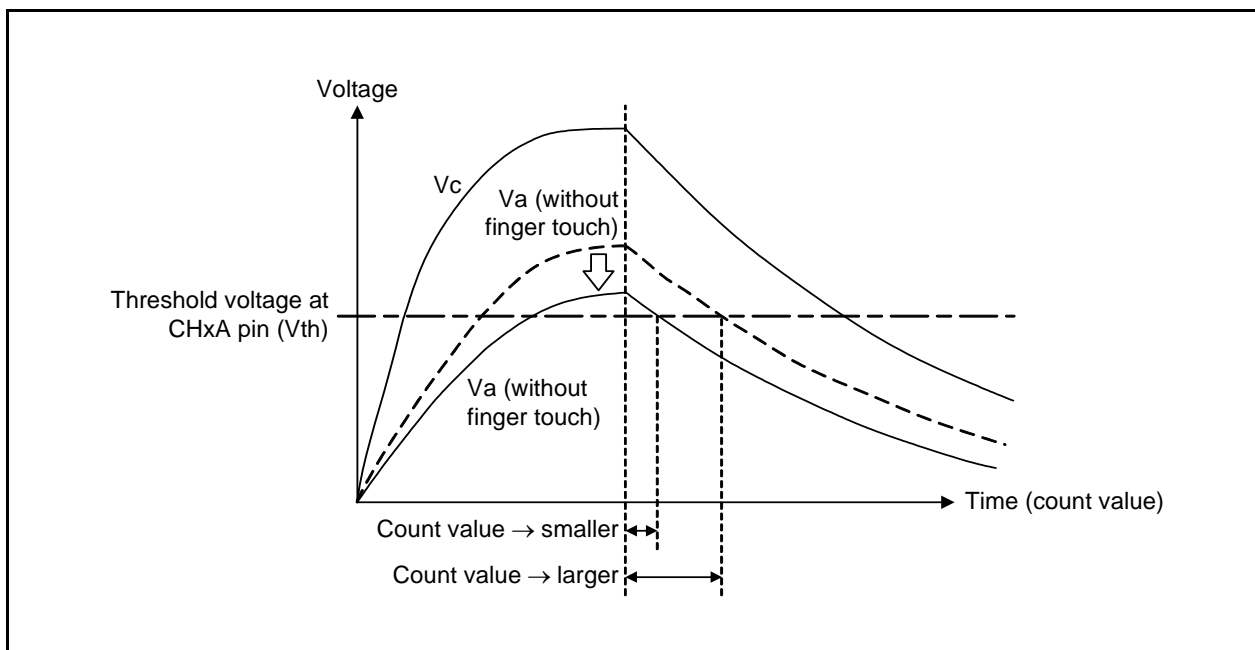

**Figure 24.6 Time-dependent Variation of Va and Vc**

As the finger comes closer to the touch electrode, a change of  $\Delta C_x$  is generated and Va is expressed by the following formula (B).

$$V_a = \frac{C_r}{C_r + C_x + \Delta C_x} V_c \dots \dots \text{formula (B)}$$

As a result, as shown in Figure 24.7, the voltage level at the CHxA pin changes and the count value gets smaller. The sensor control unit detects this difference to implement touch detection.

**Figure 24.7** Variation of Measured Value with and without Finger Touch

## 24.5 Notes on Sensor Control Unit

### 24.5.1 Address to Store Detection Data

Set the start address in the SCUDAR register.

Also set the same start address in the DTDARj (j = 0 to 23) register of the DTC.

For the DTC settings, refer to **15. DTC**.

### 24.5.2 Wait Mode

- When the sensor control unit is used in wait mode, set wait mode immediately after setting the SCSTRT bit in the SCUCR0 register to 1 (measurement starts).

If the MCU exits wait mode during touch detection, the EWMER bit in the SCUFR register is set to 1. The detection data at that time is undefined.

- To enter wait mode while the sensor control unit is operating (the SCUE bit in the SCUCR0 register is set to 1), do not use the CM30 bit (wait control bit) in the CM3 register. Use the WAIT instruction.
- When the sensor control unit is used in wait mode, set the WTFMACT bit in the FMR1 register to 1 (flash memory operates in wait mode).

### 24.5.3 A/D Converter

Do not use the A/D converter (or do not set the ADST bit in the ADCON0 register to 1) while the sensor control unit is operating.

### 24.5.4 Measurement Trigger

- If a measurement start trigger is generated during forced stop, all counter values change to 0.
- The measurement start trigger is recognized when bits SCCAP1 to SCCAP0 in the SCUMR register are set from 10b (measurement start trigger from timer RC) to 11b (external trigger ( $\overline{\text{SCUTRG}}$ ) while the  $\overline{\text{SCUTRG}}$  pin is held "L" during measurement operation.

### 24.5.5 Charging Time

To prevent measurement data from being overwritten to the next measurement data, the sensor control unit should be kept charged until DTC transfer or internal SDMA transfer is completed.

## 25. Flash Memory

The flash memory can perform in the following three rewrite modes: CPU rewrite mode, standard serial I/O mode, and parallel I/O mode.

### 25.1 Overview

Table 25.1 lists the Flash Memory Performance. (Refer to **Tables 1.1 and 1.2 R8C/33T Group Specifications** for items not listed in Table 25.1.) Table 25.2 lists the Flash Memory Rewrite Mode.

**Table 25.1 Flash Memory Performance**

Item		Specification
Flash memory operating mode		3 modes (CPU rewrite, standard serial I/O, and parallel I/O)
Division of erase blocks		Refer to <b>Figure 25.1</b> .
Programming method		Byte units
Erasure method		Block erase
Programming and erasure control method <sup>(1)</sup>		Program and erase control by software commands
Rewrite control method	Blocks 0 to 3 (Program ROM) <sup>(3)</sup>	Rewrite protect control in block units by the lock bit
	Blocks A, B, C, and D (Data flash)	Individual rewrite protect control on blocks A, B, C, and D by bits FMR14, FMR15, FMR16, and FMR17 in the FMR1 register
Number of commands		7 commands
Programming and erasure endurance <sup>(2)</sup>	Blocks 0 to 3 (Program ROM) <sup>(3)</sup>	1,000 times
	Blocks A, B, C, and D (Data flash)	10,000 times
ID code check function		Standard serial I/O mode supported
ROM code protection		Parallel I/O mode supported

Notes:

1. To perform programming and erasure, use VCC = 2.7 V to 5.5 V as the supply voltage. Do not perform programming and erasure at less than 2.7 V.
2. Definition of programming and erasure endurance  
The programming and erasure endurance is defined on a per-block basis.  
If the programming and erasure endurance is n (n = 1,000 or 10,000), each block can be erased n times. For example, if 1,024 1-byte writes are performed to different addresses in block A, a 1-Kbyte block, and then the block is erased, the programming/ erasure endurance still stands at one. When performing 100 or more rewrites, the actual erase count can be reduced by executing program operations in such a way that all blank areas are used before performing an erase operation. Avoid rewriting only particular blocks and try to average out the programming and erasure endurance of the blocks. It is also advisable to retain data on the erasure endurance of each block and limit the number of erase operations to a certain number.
3. The number of blocks and block division vary with the MCU. Refer to **Figure 25.1 R8C/33T Group Flash Memory Block Diagram** for details.

**Table 25.2 Flash Memory Rewrite Mode**

Flash Memory Rewrite Mode	CPU Rewrite Mode	Standard Serial I/O Mode	Parallel I/O Mode
Function	User ROM area is rewritten by executing software commands from the CPU.	User ROM area is rewritten using a dedicated serial programmer.	User ROM area is rewritten using a dedicated parallel programmer.
Rewritable area	User ROM	User ROM	User ROM
Rewrite programs	User program	Standard boot program	—

## 25.2 Memory Map

The flash memory contains a user ROM area and a boot ROM area (reserved area).

Figure 25.1 shows the R8C/33T Group Flash Memory Block Diagram.

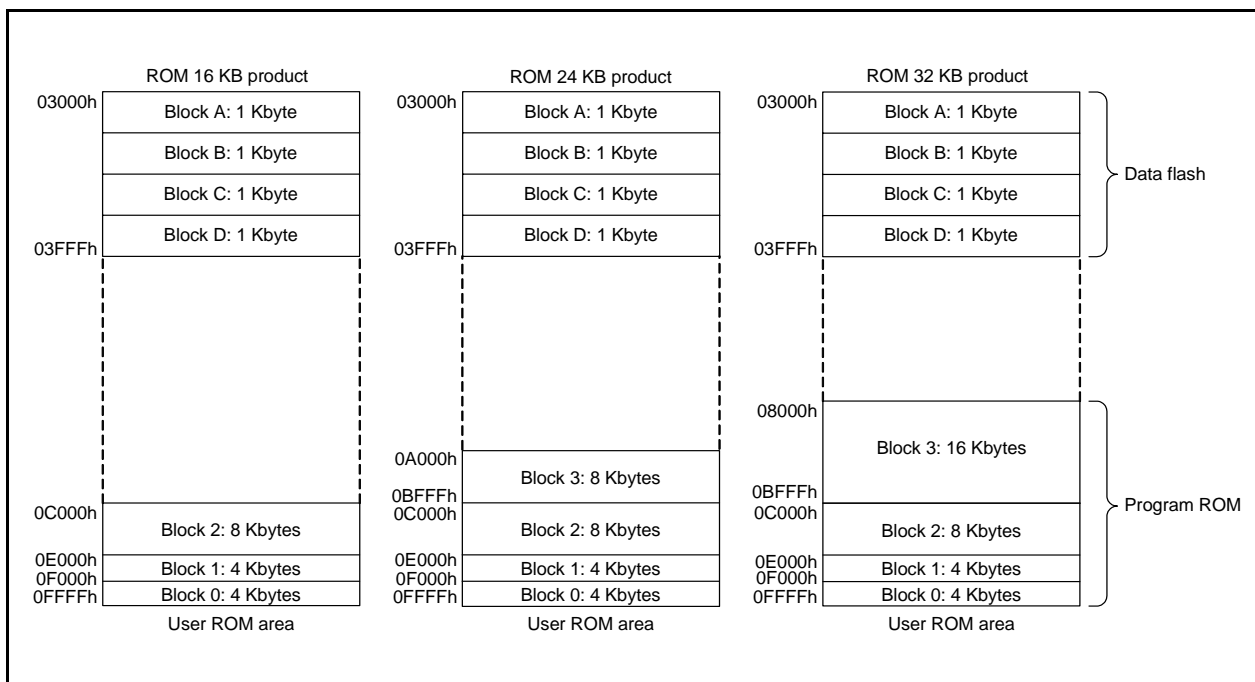

The user ROM area contains program ROM and data flash.

Program ROM: Flash memory mainly used for storing programs

Data flash: Flash memory mainly used for storing data to be rewritten

The user ROM area is divided into several blocks. The user ROM area can be rewritten in CPU rewrite mode, standard serial I/O mode, or parallel I/O mode.

The rewrite control program (standard boot program) for standard serial I/O mode is stored in the boot ROM area before shipment. The boot ROM area is allocated separately from the user ROM area.

**Figure 25.1 R8C/33T Group Flash Memory Block Diagram**

## 25.3 Functions to Prevent Flash Memory from being Rewritten

Standard serial I/O mode has an ID code check function, and parallel I/O mode has a ROM code protect function to prevent the flash memory from being read or rewritten easily.

### 25.3.1 ID Code Check Function

The ID code check function is used in standard serial I/O mode. Unless 3 bytes (addresses 0FFFCh to 0FFFEh) of the reset vector are set to FFFFFFFh, the ID codes sent from the serial programmer or the on-chip debugging emulator and the 7-byte ID codes written in the flash memory are checked to see if they match. If the ID codes do not match, the commands sent from the serial programmer or the on-chip debugging emulator are not accepted. For details of the ID code check function, refer to **12. ID Code Areas**.

### 25.3.2 ROM Code Protect Function

The ROM protect function prevents the contents of the flash memory from being read, rewritten, or erased using the OFS register in parallel I/O mode.

Refer to **13. Option Function Select Area** for details of the option function select area.

The ROM code protect function is enabled by writing 1 to the ROMCR bit and writing 0 to the ROMCP1 bit. This prevents the contents of the on-chip flash memory from being read or rewritten.

Once ROM code protection is enabled, the content of the internal flash memory cannot be rewritten in parallel I/O mode. To disable ROM code protection, erase the block including the OFS register using CPU rewrite mode or standard serial I/O mode.

### 25.3.3 Option Function Select Register (OFS)

Address 0FFFFh

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	CSPROINI	LVDAS	VDSEL1	VDSEL0	ROMCP1	ROMCR	—	WDTON
After Reset	User Setting Value <sup>(1)</sup>							

Bit	Symbol	Bit Name	Function	R/W
b0	WDTON	Watchdog timer start select bit	0: Watchdog timer automatically starts after reset. 1: Watchdog timer is stopped after reset.	R/W
b1	—	Reserved bit	Set to 1.	R/W
b2	ROMCR	ROM code protect disable bit	0: ROM code protect disabled 1: ROMCP1 bit enabled	R/W
b3	ROMCP1	ROM code protect bit	0: ROM code protect enabled 1: ROM code protect disabled	R/W
b4	VDSEL0	Voltage detection 0 level select bit <sup>(2)</sup>	b5 b4 0 0: 3.80 V selected (Vdet0_3) 0 1: 2.85 V selected (Vdet0_2) 1 0: 2.35 V selected (Vdet0_1) 1 1: 1.90 V selected (Vdet0_0)	R/W
b5	VDSEL1			R/W
b6	LVDAS	Voltage detection 0 circuit start bit <sup>(3)</sup>	0: Voltage monitor 0 reset enabled after reset 1: Voltage monitor 0 reset disabled after reset	R/W
b7	CSPROINI	Count source protection mode after reset select bit	0: Count source protect mode enabled after reset 1: Count source protect mode disabled after reset	R/W

Notes:

- The OFS register is allocated in the flash memory, not in the SFRs. Set appropriate values as ROM data by a program.  
Do not write additions to the OFS register. If the block including the OFS register is erased, the OFS register is set to FFh.  
When blank products are shipped, the OFS register is set to FFh. It is set to the written value after written by the user.  
When factory-programming products are shipped, the value of the OFS register is the value programmed by the user.
- The same level of the voltage detection 0 level selected by bits VDSEL0 and VDSEL1 is set in both functions of voltage monitor 0 reset and power-on reset.
- To use power-on reset and voltage monitor 0 reset, set the LVDAS bit to 0 (voltage monitor 0 reset enabled after reset).

For a setting example of the OFS register, refer to **13.3.1 Setting Example of Option Function Select Area**.

#### LVDAS Bit (Voltage Detection 0 Circuit Start Bit)

The Vdet0 voltage to be monitored by the voltage detection 0 circuit is selected by bits VDSEL0 and VDSEL1.

## 25.4 CPU Rewrite Mode

In CPU rewrite mode, the user ROM area can be rewritten by executing software commands from the CPU. Therefore, the user ROM area can be rewritten directly while the MCU is mounted on a board without using a ROM programmer. Execute the software command only to blocks in the user ROM area.

The flash module has an erase-suspend function which halts the erase operation temporarily during an erase operation in CPU rewrite mode. During erase-suspend, the flash memory can be read or programmed.

Erase-write 0 mode (EW0 mode) and erase-write 1 mode (EW1 mode) are available in CPU rewrite mode.

Table 25.3 lists the Differences between EW0 Mode and EW1 Mode.

**Table 25.3 Differences between EW0 Mode and EW1 Mode**

Item	EW0 Mode	EW1 Mode
Operating mode	Single-chip mode	Single-chip mode
Rewrite control program allocatable area	User ROM	User ROM
Rewrite control program executable areas	RAM (The rewrite control program must be transferred before being executed.) However, the program can be executed in the program ROM area when rewriting the data flash area.	User ROM or RAM
Rewritable area	User ROM	User ROM However, blocks which contain the rewrite control program are excluded.
Software command restrictions	—	Program and block erase commands cannot be executed to any block which contains the rewrite control program.
Mode after programming or block erasure or after entering erase-suspend	Read array mode	Read array mode
CPU state during programming and block erasure	The CPU operates.	<ul style="list-style-type: none"> <li>The CPU operates while the data flash area is being programmed or block erased.</li> <li>The CPU is put in a hold state while the program ROM area is being programmed or block erased. (I/O ports retain the state before the command execution).</li> </ul>
Flash memory status detection	Read bits FST7, FMT5, and FMT4 in the FST register by a program.	Read bits FST7, FMT5, and FMT4 in the FST register by a program.
Conditions for entering erase-suspend	<ul style="list-style-type: none"> <li>Set bits FMR20 and FMR21 in the FMR2 register to 1 by a program.</li> <li>Set bits FMR20 and FMR22 in the FMR2 register to 1 and the enabled maskable interrupt is generated.</li> </ul>	<ul style="list-style-type: none"> <li>Set bits FMR20 and FMR21 in the FMR2 register to 1 by a program (while rewriting the data flash area).</li> <li>Set bits FMR20 and FMR22 in the FMR2 register to 1 and the enabled maskable interrupt is generated.</li> </ul>
CPU clock	Max. 20 MHz	Max. 20 MHz

### 25.4.1 Flash Memory Status Register (FST)

Address 01B2h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	FST7	FST6	FST5	FST4	—	LBDATA	BSYAEI	RDYSTI
After Reset	1	0	0	0	0	X	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	RDYSTI	Flash ready status interrupt request flag (1, 4)	0: No flash ready status interrupt request 1: Flash ready status interrupt request	R/W
b1	BSYAEI	Flash access error interrupt request flag (2, 4)	0: No flash access error interrupt request 1: Flash access error interrupt request	R/W
b2	LBDATA	LBDATA monitor flag	0: Locked 1: Not locked	R
b3	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b4	FST4	Program error flag (3)	0: No program error 1: Program error	R
b5	FST5	Erase error/blank check error flag (3)	0: No erase error/blank check error 1: Erase error/blank check error	R
b6	FST6	Erase-suspend status flag	0: Other than erase-suspend 1: During erase-suspend	R
b7	FST7	Ready/busy status flag	0: Busy 1: Ready	R

Notes:

1. The RDYSTI bit cannot be set to 1 (flash ready status interrupt request) by a program.
2. The BSYAEI bit cannot be set to 1 (flash access error interrupt request) by a program.
3. This bit is also set to 1 (error) when a command error occurs.
4. When this bit is set to 1, do not set the FMR01 bit in the FMR0 register to 0 (CPU rewrite mode disabled).

#### RDYSTI Bit (Flash Ready Status Flag Interrupt Request Flag)

When the RDYSTIE bit in the FMR0 register is set to 1 (flash ready status interrupt enabled) and auto-programming or auto-erasure completes, or erase-suspend mode is entered, the RDYSTI bit is set to 1 (flash ready status interrupt request).

During interrupt handling, set the RDYSTI bit to 0 (no flash ready status interrupt request).

[Condition for setting to 0]

Set to 0 by an interrupt handling program.

[Condition for setting to 1]

When the flash memory status changes from busy to ready while the RDYSTIE bit in the FRMR0 register is set to 1, the RDYSTI bit is set to 1.

The status is changed from busy to ready in the following states:

- Completion of erasing/programming the flash memory
- Suspend acknowledgement
- Completion of forcible termination
- Completion of the lock bit program
- Completion of the read lock bit status
- Completion of the block blank check
- When the flash memory can be read after it has been stopped.

### BSYAEI Bit (Flash Access Error Interrupt Request Flag)

The BSYAEI bit is set to 1 (flash access error interrupt request) when the BSYAEIE bit in the FMR0 register is set to 1 (flash access error interrupt enabled) and the block during auto-programming/auto-erase is accessed. This bit is also set to 1 if an erase or program error occurs when the CMDERIE bit in the FMR0 register is set to 1 (erase/write error interrupt enabled).

During interrupt handling, set the BSYAEI bit to 0 (no flash access error interrupt request).

[Conditions for setting to 0]

- (1) Set to 0 by an interrupt handling program.
- (2) Execute the clear status register command.

[Conditions for setting to 1]

- (1) Read or write the area that is being erased/written when the BSYAEIE bit in the FMR0 register is set to 1 and while the flash memory is busy.  
Or, read the data flash area while erasing/writing to the program ROM area. (Note that the read value is undefined in both cases. Writing has no effect.)
- (2) If a command sequence error, erase error, blank check error, or program error occurs when the CMDERIE bit in the FMR0 register is set to 1 (erase/write error interrupt enabled).

### LBDATA Bit (LBDATA Monitor Flag)

This is a read-only bit indicating the lock bit status. To confirm the lock bit status, execute the read lock bit status command and read the LBDATA bit after the FST7 bit is set to 1 (ready).

The condition for updating this bit is when the program, erase, read lock bit status commands are generated.

When the read lock bit status command is input, the FST7 bit is set to 0 (busy). At the time when the FST7 bit is set to 1 (ready), the lock bit status is stored in the LBDATA bit. The data in the LBDATA bit is retained until the next command is input.

### FST4 Bit (Program Error Flag)

This is a read-only bit indicating the auto-programming status. The bit is set to 1 if a program error occurs; otherwise, it is set to 0. Refer to **25.4.12 Full Status Check** for details.

### FST5 Bit (Erase Error/Blank Check Error Flag)

This is a read-only bit indicating the status of auto-programming or the block blank check command. The bit is set to 1 if an erase error or blank check error occurs; otherwise, it is set to 0. Refer to **25.4.12 Full Status Check** for details.

### FST6 Bit (Erase Suspend Status Flag)

This is a read-only bit indicating the suspend status. The bit is set to 1 when an erase-suspend request is acknowledged and a suspend status is entered; otherwise, it is set to 0.

### FST7 Bit (Ready/Busy Status Flag)

When the FST7 bit is set to 0 (busy), the flash memory is in one of the following states:

- During programming
- During erasure
- During the lock bit program
- During the read lock bit status
- During the block blank check
- During forced stop operation
- The flash memory is being stopped
- The flash memory is being activated

Otherwise, the FST7 bit is set to 1 (ready).

## 25.4.2 Flash Memory Control Register 0 (FMR0)

Address 01B4h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	RDYSTIE	BSYAEIE	CMDERIE	CMDRST	FMSTP	FMR02	FMR01	—
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	—	Reserved bit	Set to 0.	R/W
b1	FMR01	CPU rewrite mode select bit (1, 4)	0: CPU rewrite mode disabled 1: CPU rewrite mode enabled	R/W
b2	FMR02	EW1 mode select bit (1)	0: EW0 mode 1: EW1 mode	R/W
b3	FMSTP	Flash memory stop bit (2)	0: Flash memory operates 1: Flash memory stops (Low-power consumption state, flash memory initialization)	R/W
b4	CMDRST	Erase/write sequence reset bit (3)	When the CMDRST bit is set to 1, the erase/write sequence is reset and erasure/writing can be forcibly stopped. When read, the content is 0.	R/W
b5	CMDERIE	Erase/write error interrupt enable bit	0: Erase/write error interrupt disabled 1: Erase/write error interrupt enabled	R/W
b6	BSYAEIE	Flash access error interrupt enable bit	0: Flash access error interrupt disabled 1: Flash access error interrupt enabled	R/W
b7	RDYSTIE	Flash ready status interrupt enable bit	0: Flash ready status interrupt disabled 1: Flash ready status interrupt enabled	R/W

Notes:

1. To set this bit to 1, first write 0 and then 1 immediately. Disable interrupts and DTC activation between writing 0 and writing 1.
2. Write to the FMSTP bit by a program transferred to the RAM. The FMSTP bit is enabled when the FMR01 bit is set to 1 (CPU rewrite mode enabled). To set the FMSTP bit to 1 (flash memory stops), set it when the FST7 bit in the FST register is set to 1 (ready).
3. The CMDRST bit is enabled when the FMR01 bit is set to 1 (CPU rewrite mode enabled) and the FST7 bit in the FST register is set to 0 (busy).
4. To set the FMR01 bit to 0 (CPU rewrite mode disabled), set it when the RDYSTI bit in the FST register is set to 0 (no flash ready status interrupt request) and the BSYAEI bit is set to 0 (no flash access error interrupt request).

### FMR01 Bit (CPU Rewrite Mode Select Bit)

When the FMR01 bit is set to 1 (CPU rewrite mode enabled), the MCU is made ready to accept software commands.

### FMR02 Bit (EW1 Mode Select Bit)

When the FMR02 bit is set to 1 (EW1 mode), EW1 mode is selected.

### FMSTP Bit (Flash Memory Stop Bit)

This bit is used to initialize the flash memory control circuits, and also to reduce the amount of current consumed by the flash memory. Access to the flash memory is disabled by setting the FMSTP bit to 1.

Write to the FMSTP bit by a program transferred to the RAM.

To reduce the power consumption further in high-speed on-chip oscillator mode and low-speed on-chip oscillator mode (XIN clock stopped), set the FMSTP bit to 1. Refer to **26.2.9 Stopping Flash Memory** for details.

When entering stop mode or wait mode while CPU rewrite mode is disabled, the FMR0 register does not need to be set because the power for the flash memory is automatically turned off and is turned back on when exiting stop or wait mode.

When the FMSTP bit is set to 1 (including during the busy status (the period while the FST7 bit is 0) immediately after the FMSTP bit is changed from 1 to 0), do not set to low-current-consumption read mode at the same time.

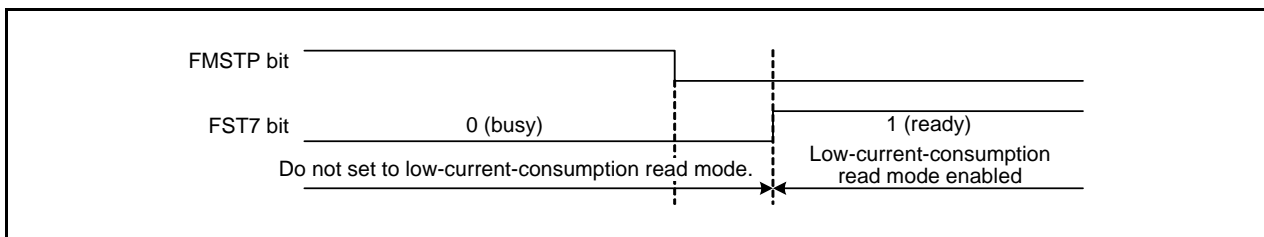

Figure 25.2 Transition to Low-Current-Consumption Read Mode

### CMDRST Bit (Erase/Write Sequence Reset Bit)

This bit is used to initialize the flash memory sequence and forcibly stop a program or erase command. The program ROM area can be read when resetting the sequence of programming/erasing the data flash area.

If the program or erase command is forcibly stopped using the CMDRST bit in the FMR0 register, execute the clear status command after the FST7 bit in the FST register is changed to 1 (ready). To program to the same address again, execute the block erase command again and ensure it has been completed normally before programming. If the addresses and blocks which the program or block erase command is forcibly stopped are allocated in the program area, set the FMR13 bit in the FMR1 register to 1 (lock bit disabled) before executing the block erasure command again.

When the CMDRST bit is set to 1 (erasure/writing stopped) during erase-suspend, the suspend status is also initialized. Thus execute block erasure again to the block which the block erasure is being suspended.

When  $t_d(\text{CMDRST-READY})$  has elapsed after the CMDRST bit is set to 1 (erasure/writing stopped), the executing command is forcibly terminated and reading from the flash memory is enabled.

### CMDERIE Bit (Erase/Write Error Interrupt Enable Bit)

This bit enables an flash command error interrupt to be generated if the following errors occur:

- Program error
- Block erase error
- Command sequence error
- Block blank check error

If the CMDERIE bit is set to 1 (erase/write error interrupt enabled) and erasure/writing is performed, an interrupt is generated if the above errors occur.

If a flash command error interrupt is generated, execute the clear status register command during interrupt handling.

### BSYAEIE Bit (Flash Access Error Interrupt Enable Bit)

This bit enables a flash access error interrupt to be generated if the flash memory during rewriting is accessed.

### RDYSTIE Bit (Flash Ready Status Interrupt Enable Bit)

This bit enables a flash ready status error interrupt to be generated when the status of the flash memory sequence changes from the busy to ready status.

### 25.4.3 Flash Memory Control Register 1 (FMR1)

Address 01B5h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	FMR17	FMR16	FMR15	FMR14	FMR13	—	WTFMACT	—
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b1	WTFMACT	Flash memory stop bit in wait mode	0: Flash memory stops in wait mode 1: Flash memory operates in wait mode	R/W
b2	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b3	FMR13	Lock bit disable select bit <sup>(1)</sup>	0: Lock bit enabled 1: Lock bit disabled	R/W
b4	FMR14	Data flash block A rewrite disable bit <sup>(2, 3)</sup>	0: Rewrite enabled (software command acceptable) 1: Rewrite disabled (software command not acceptable, no error occurred)	R/W
b5	FMR15	Data flash block B rewrite disable bit <sup>(2, 3)</sup>	0: Rewrite enabled (software command acceptable) 1: Rewrite disabled (software command not acceptable, no error occurred)	R/W
b6	FMR16	Data flash block C rewrite disable bit <sup>(2, 3)</sup>	0: Rewrite enabled (software command acceptable) 1: Rewrite disabled (software command not acceptable, no error occurred)	R/W
b7	FMR17	Data flash block D rewrite disable bit <sup>(2, 3)</sup>	0: Rewrite enabled (software command acceptable) 1: Rewrite disabled (software command not acceptable, no error occurred)	R/W

Notes:

1. To set the FMR13 bit to 1, first write 0 and then 1 immediately. Disable interrupts and DTC activation between writing 0 and writing 1.
2. To set this bit to 0, first write 1 and then 0 immediately. Disable interrupts and DTC activation between writing 1 and writing 0.
3. This bit is set to 0 when the FMR01 bit in the FMR0 register is set to 0 (CPU rewrite mode disabled).

#### FMR13 Bit (Lock Bit Disable Select Bit)

When the FMR13 bit is set to 1 (lock bit disabled), the lock bit is disabled. When the FMR13 bit is set to 0, the lock bit is enabled. Refer to **25.4.10 Data Protect Function** for the details of the lock bit.

The FMR13 bit enables the lock bit function only and the lock bit data does not change. However, when a block erase command is executed while the FMR13 bit is set to 1, the lock bit data set to 0 (locked) changes to 1 (not locked) after erasure completes.

[Conditions for setting to 0]

The FMR13 bit is set to 0 when one of the following conditions is met.

- Completion of the program command
- Completion of the erase command
- Generation of a command sequence error
- Transition to erase-suspend
- If the FMR01 bit in the FMR0 register is set to 0 (CPU rewrite mode disabled).
- If the FMSTP bit in the FMR0 register is set to 1 (flash memory stops).
- If the CMDRST bit in the FMR0 register is set to 1 (erasure/writing stopped).

[Condition for setting to 1]

Set to 1 by a program.

**FMR14 Bit (Data Flash Block A Rewrite Disable Bit)**

When the FMR 14 bit is set to 0, data flash block A accepts program and block erase commands.

**FMR15 Bit (Data Flash Block B Rewrite Disable Bit)**

When the FMR 15 bit is set to 0, data flash block B accepts program and block erase commands.

**FMR16 Bit (Data Flash Block C Rewrite Disable Bit)**

When the FMR 16 bit is set to 0, data flash block C accepts program and block erase commands.

**FMR17 Bit (Data Flash Block D Rewrite Disable Bit)**

When the FMR 17 bit is set to 0, data flash block D accepts program and block erase commands.

### 25.4.4 Flash Memory Control Register 2 (FMR2)

Address 01B6h

Bit	b7	b6	b5	b4	b3	b2	b1	b0
Symbol	FMR27	—	—	—	—	FMR22	FMR21	FMR20
After Reset	0	0	0	0	0	0	0	0

Bit	Symbol	Bit Name	Function	R/W
b0	FMR20	Erase-suspend enable bit <sup>(1)</sup>	0: Erase-suspend disabled 1: Erase-suspend enabled	R/W
b1	FMR21	Erase-suspend request bit <sup>(2)</sup>	0: Erase restart 1: Erase-suspend request	R/W
b2	FMR22	Interrupt request suspend request enable bit <sup>(1)</sup>	0: Erase-suspend request disabled by interrupt request 1: Erase-suspend request enabled by interrupt request	R/W
b3	—	Nothing is assigned. If necessary, set to 0. When read, the content is 0.		—
b4	—	Reserved bits	Set to 0.	R/W
b5	—			
b6	—			
b7	FMR27	Low-consumption-current read mode enable bit <sup>(1, 3)</sup>	0: Low-consumption-current read mode disabled 1: Low-consumption-current read mode enabled	R/W

Notes:

1. To set this bit to 1, first write 0 and then 1 immediately. Disable interrupts and DTC activation between writing 0 and writing 1.
2. To set the FMR21 bit to 0 (erase restart), set it when the FMR01 bit in the FMR0 register is set to 1 (CPU rewrite mode enabled).
3. After setting the CPU clock to the low-speed on-chip oscillator clock divided by 4, 8, or 16, set the FMR27 bit to 1. When divided by 1 (no division) or divided by 2 is set, do not use low-consumption-current read mode. Enter wait mode or stop mode after setting the FMR27 bit to 0 (low-current-consumption read mode disabled). Do not enter wait mode or stop mode while the FMR27 bit is 1 (low-current-consumption read mode enabled).

#### FMR20 Bit (Erase-Suspend Enable Bit)

When the FMR20 bit is set to 1 (enabled), the erase-suspend function is enabled.

#### FMR21 Bit (Erase-Suspend Request Bit)

When the FMR21 bit is set to 1, erase-suspend mode is entered. If the FMR22 bit is set to 1 (erase-suspend request enabled by interrupt request), the FMR21 bit is automatically set to 1 (erase-suspend request) when an interrupt request for the enabled interrupt is generated, and erase-suspend mode is entered. To restart auto-erasure, set the FMR21 bit to 0 (erase restart).

[Condition for setting to 0]

Set to 0 by a program.

[Conditions for setting to 1]

- When the FMR22 bit is set to 1 (erase-suspend request enabled by interrupt request) at the time an interrupt is generated.
- Set to 1 by a program.

#### FMR22 Bit (Interrupt Request Suspend-Request Enable Bit)

When the FMR 22 bit is set to 1 (erase-suspend request enabled by interrupt request), the FMR21 bit is automatically set to 1 (erase-suspend request) at the time an interrupt request is generated during auto-erasure. Set the FMR22 bit to 1 when using erase-suspend while rewriting the user ROM area in EW1 mode.

### FMR27 Bit (Low-Power-Current Read Mode Enable Bit)

When the FMR 27 bit is set to 1 (low-consumption-current read mode enabled) in low-speed on-chip oscillator mode (XIN clock stopped), power consumption when reading the flash memory can be reduced. Refer to **26.2.10 Low-Current-Consumption Read Mode** for details.

When the CPU clock is set to the low-speed on-chip oscillator clock divided by 4, 8, or 16, low-consumption-current read mode can be used. When divided by 1 (no division) or divided by 2 is set, do not use low-consumption-current read mode. After setting the divide ratio of the CPU clock, set the FMR27 bit to 1.

Enter wait mode or stop mode after setting the FMR27 bit to 0 (low-current-consumption read mode disabled).

Do not enter wait mode or stop mode while the FMR27 bit is 1 (low-current-consumption read mode enabled).

When the FMR27 bit is set to 1 (low-consumption-current read mode enabled), do not execute the program, block erase, or lock bit program command. To change the FMSTP bit from 1 (flash memory stops) to 0 (flash memory operates), make the setting when the FMR27 bit is set to 0 (low-consumption-current read mode disabled).

### 25.4.5 EW0 Mode

When the FMR01 bit in the FMR0 register is set to 1 (CPU rewrite mode enabled), the MCU enters CPU rewrite mode and software commands can be accepted. At this time, the FMR02 bit in the FMR0 register is set to 0 so that EW0 mode is selected.

Software commands are used to control program and erase operations. The FST register can be used to confirm whether programming or erasure has completed.

To enter erase-suspend during auto-erasure, set the FMR20 bit to 1 (erase-suspend enabled) and the FMR21 bit to 1 (erase-suspend request). Next, verify the FST7 bit in the FST register is set to 1 (ready), then verify the FST6 bit is set to 1 (during erase-suspend) before accessing the flash memory. When the FST6 bit is set to 0, erasure completes.

When the FMR21 bit in the FMR2 register is set to 0 (erase restart), auto-erasure restarts. To confirm whether auto-erasure has restarted, verify the FST7 bit in the FST register is set to 0, then verify the FST6 bit is set to 0 (other than erase-suspend).

### 25.4.6 EW1 Mode

After the FMR01 bit in the FMR0 register is set to 1 (CPU rewrite mode enabled), EW1 mode is selected by setting the FMR02 bit is set to 1.

The FST register can be used to confirm whether programming and erasure has completed.

To enable the erase-suspend function during auto-erasure, execute the block erase command after setting the FMR20 bit in the FMR2 register to 1 (suspend enabled). To enter erase-suspend while auto-erasing the user ROM area, set the FMR22 bit in the FMR2 register to 1 (erase-suspend request enabled by interrupt request). Also, the interrupt to enter erase-suspend must be enabled beforehand.

When an interrupt request is generated, the FMR21 bit in the FMR2 register is automatically set to 1 (erase-suspend request) and auto-erasure suspends after td(SR-SUS). After interrupt handling completes, set the FMR21 bit to 0 (erase restart) to restart auto-erasure.

### 25.4.7 Suspend Operation

The suspend function halts the auto-erase operation temporarily during auto-erase.

When auto-erase is suspended, the next operation can be executed. (Refer to **Table 25.4 Executable Operation during Suspend**.)

- When suspending the auto-erase of any block in data flash, auto-programming and reading another block can be executed.
- When suspending the auto-erase of data flash, auto-programming and reading program ROM can be executed.
- When suspending the auto-erase of any block in program ROM, auto-programming and reading another block can be executed.
- When suspending the auto-erase of program ROM, auto-programming and reading data flash can be executed.
- To check the suspend, verify the FST7 bit is set to 1 (ready), then verify the FST6 bit is set to 1 (during erase-suspend) to confirm whether erase has been suspended. When the FST6 bit is set to 0 (other than erase suspend), erase completes.

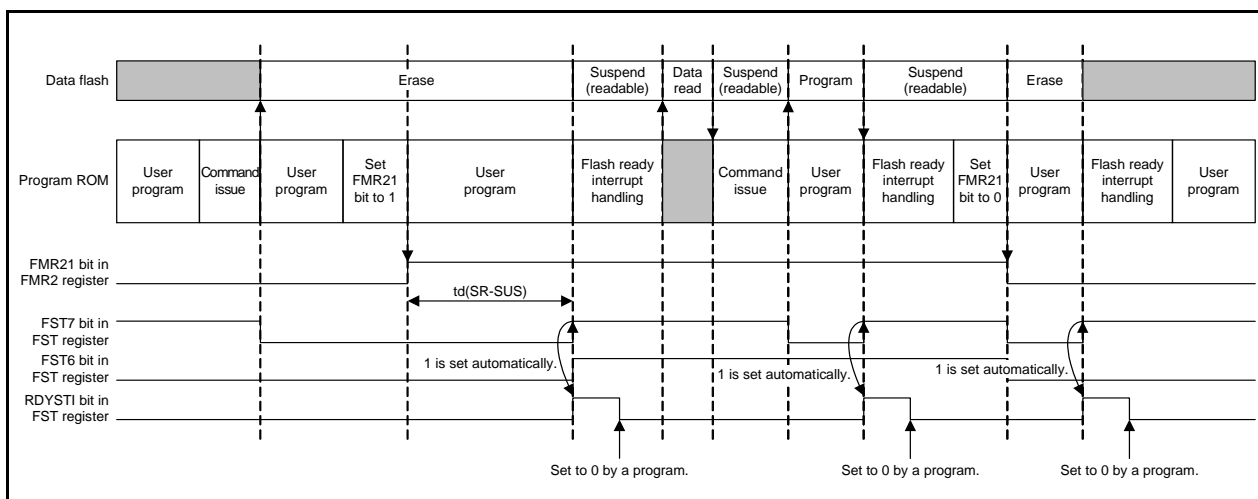

Figure 25.3 shows the Suspend Operation Timing.

**Table 25.4 Executable Operation during Suspend**

		Operation during Suspend											
		Data flash (Block during erase execution before entering suspend)			Data flash (Block during no erase execution before entering suspend)			Program ROM (Block during erase execution before entering suspend)			Program ROM (Block during no erase execution before entering suspend)		
		Erase	Program	Read	Erase	Program	Read	Erase	Program	Read	Erase	Program	Read
Areas during erase execution before entering suspend	Data flash	D	D	D	D	E	E	N/A	N/A	N/A	D	E	E <sup>(5)</sup>
	Program ROM	N/A	N/A	N/A	D	E	E	D	D	D	D	E	E

Notes:

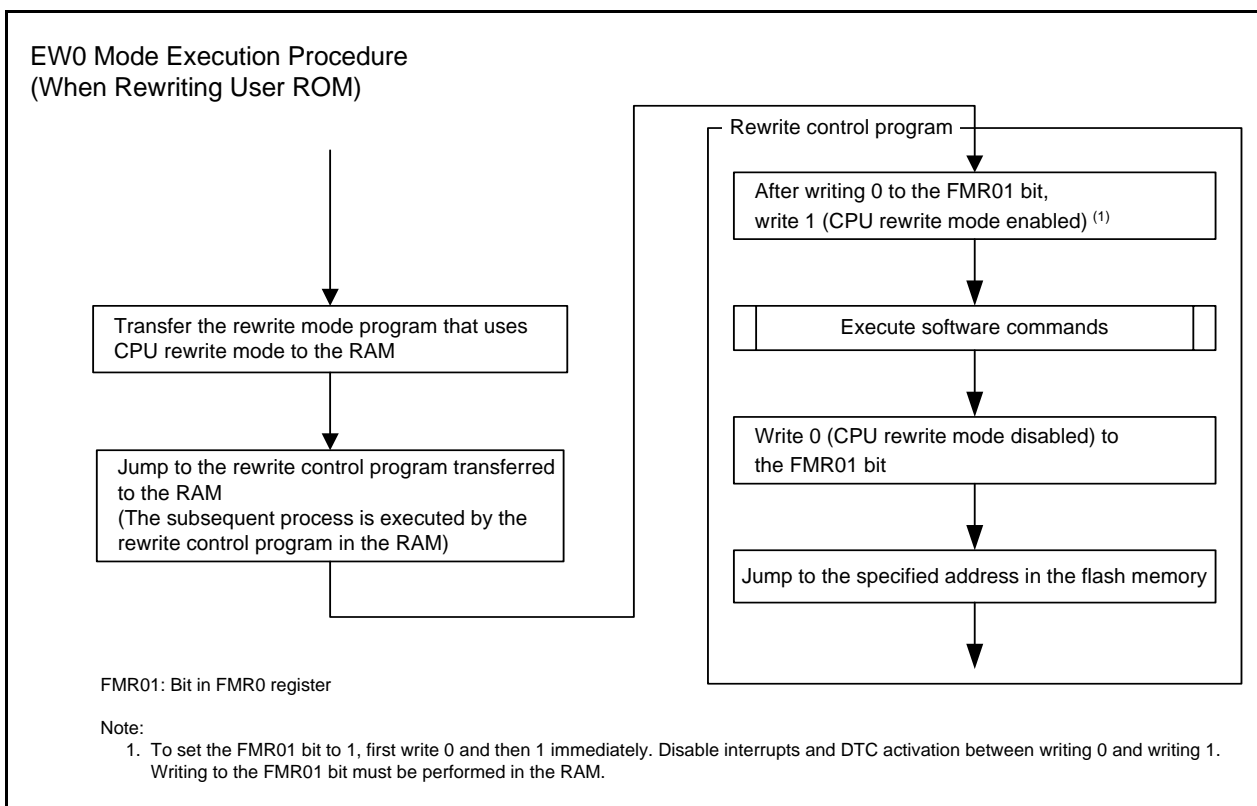

1. E indicates operation is enabled by using the suspend function, D indicates operation is disabled, and N/A indicates no combination is available.
2. Operation cannot be suspended during programming.
3. The block erase command can be executed for erase. The program, lock bit program, and read lock bit status commands can be executed for programming.  
The clear status register command can be executed when the FST7 bit in the FST register is set to 1 (ready).  
The operation of block blank check is disabled during suspend.
4. The MCU enters read array mode immediately after entering erase-suspend.
5. The program ROM area can be read with the BGO function while programming or block erasing data flash.

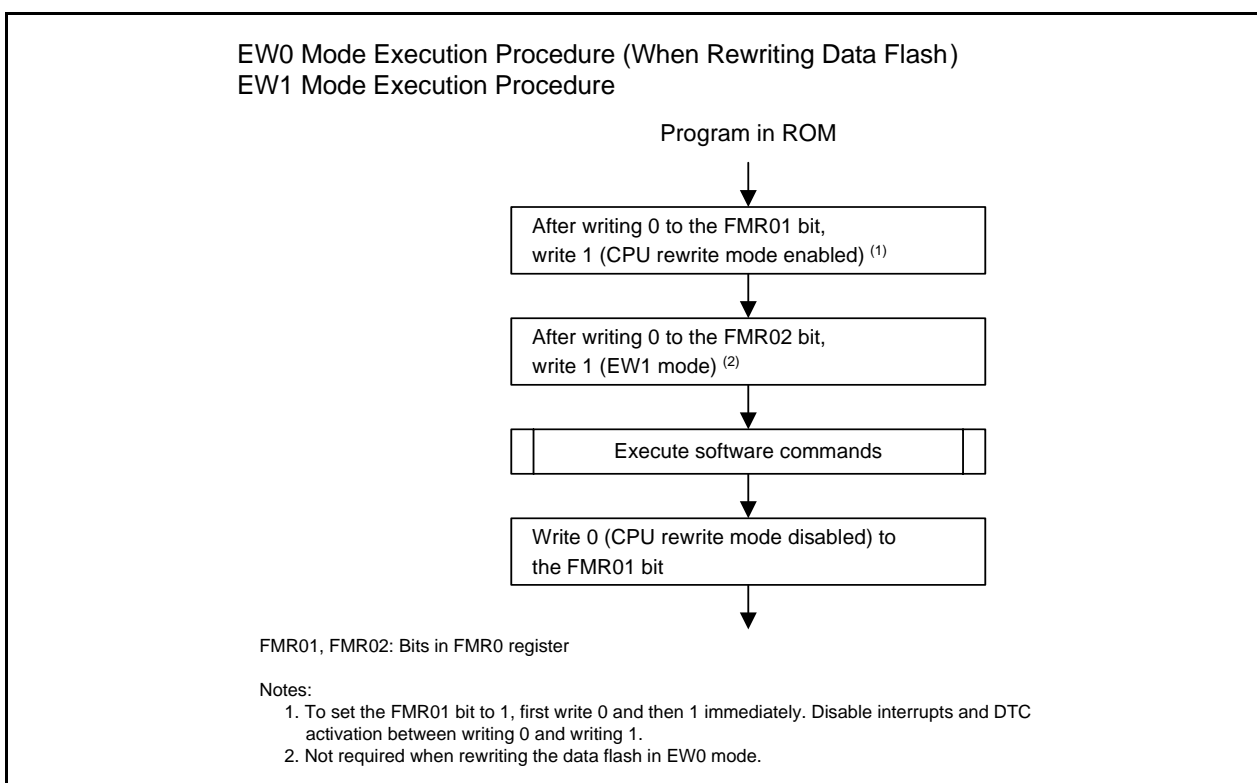

**Figure 25.3 Suspend Operation Timing**

### 25.4.8 How to Set and Exit Each Mode

Figure 25.4 shows How to Set and Exit EW0 Mode and Figure 25.5 shows How to Set and Exit EW0 Mode (When Rewriting Data Flash) and EW1 Mode.

**Figure 25.4 How to Set and Exit EW0 Mode**

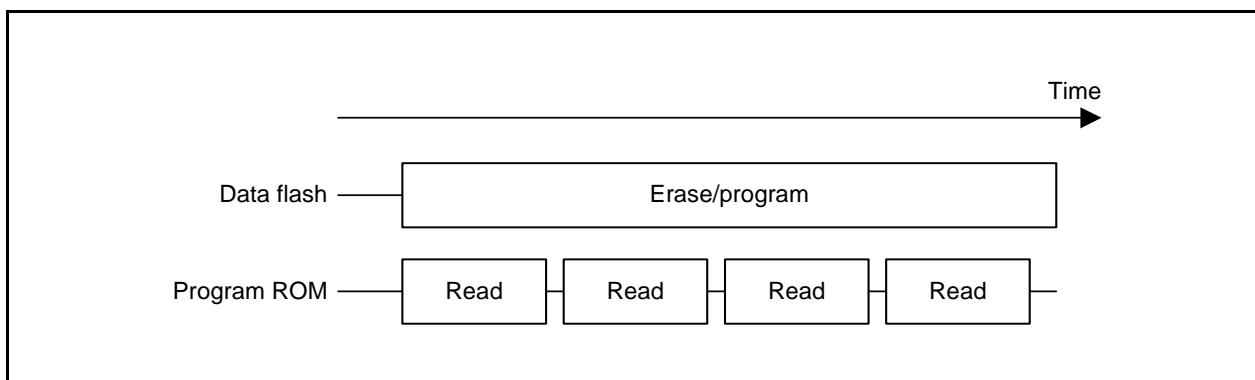

**Figure 25.5 How to Set and Exit EW0 Mode (When Rewriting Data Flash) and EW1 Mode**

### 25.4.9 BGO (BackGround Operation) Function

When the program ROM area is specified while a program or block erase operation to the data flash, array data can be read. This eliminates the need for writing software commands. Access time is the same as for normal read operations.

Any other block of the data flash cannot read during a program or block erase operation to the data flash.

Figure 25.6 shows the BGO Function.

**Figure 25.6 BGO Function**

### 25.4.10 Data Protect Function

Each block in the flash memory has a nonvolatile lock bit. The lock bit is enabled by setting the FMR13 bit in the FMR1 register is set to 0 (lock bit enabled). The lock bit can be used to disable (lock) programming or erasing each block. This prevents data from being written or erased inadvertently. A block status changes according to the lock bit as follows:

- When the lock bit data is set to 0: locked (the block cannot be programmed or erased)
- When the lock bit data is set to 1: not locked (the block can be programmed and erased)

The lock bit data is set to 0 (locked) by executing the lock bit program command and to 1 (not locked) by erasing the block. No commands can be used to set only the lock bit data to 1.

The lock bit data can be read using the read lock bit status command.

When the FMR13 bit is set to 1 (lock bit disabled), the lock bit function is disabled and all blocks are not locked (each lock bit data remains unchanged). The lock bit function is enabled by setting the FMR13 bit to 0 (the lock bit data is retained).

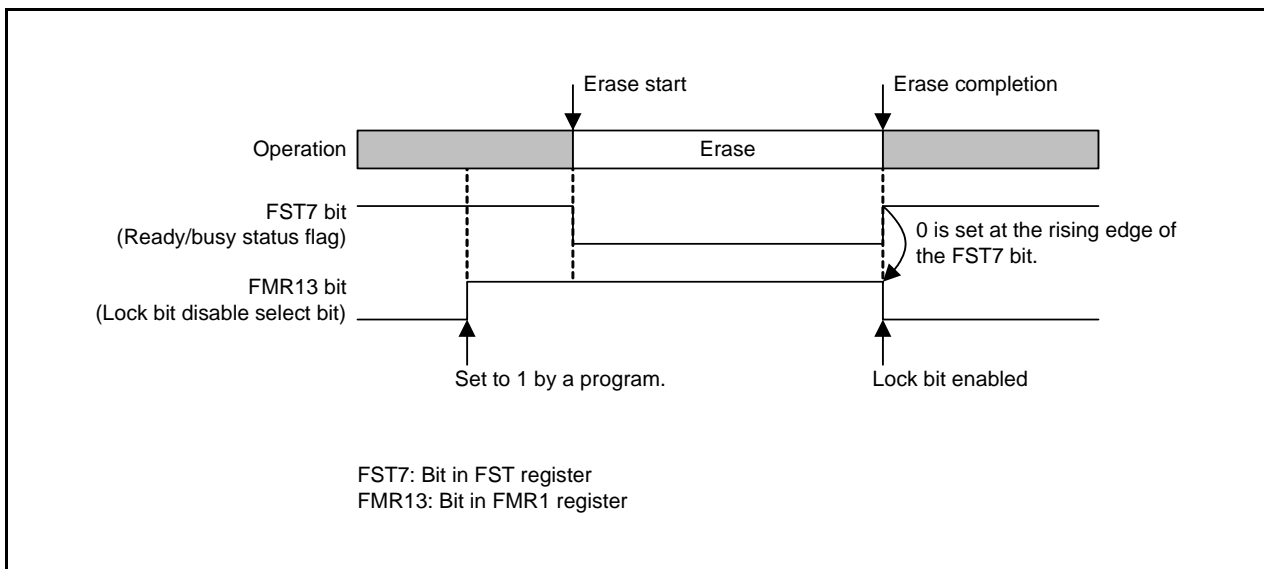

When the block erase command is executed while the FMR13 bit is set to 1, the target block is erased regardless of the lock bit status. The lock bit of the erase target block is set to 1 after auto-erasure completes.

Refer to **25.4.11 Software Commands** for the details of individual commands.

The FMR13 bit is set to 0 after auto-erasure completes. This bit is also set to 0 if one of the following conditions is met. To erase or program a different locked block, set the FMR 13 bit to 1 again and execute the block erase or program command.

- If the FST7 bit in the FST register is changed from 0 (busy) to 1 (ready).
- If a command sequence error occurs.
- If the FMR01 bit in the FMR0 register is set to 0 (CPU mode disabled).
- If the FMSTP bit in the FM0 register is set to 1 (flash memory stops).
- If the CMDRST bit in the FMR0 register is set to 1 (erasure/writing stopped).

Figure 25.7 shows the FMR13 Bit Operation Timing.

**Figure 25.7 FMR13 Bit Operation Timing**

### 25.4.11 Software Commands

The software commands are described below. Read or write commands and data in 8-bit units.  
Do not input any command other than those listed in the table below.

**Table 25.5 Software Commands**

Command	First Bus Cycle			Second Bus Cycle		
	Mode	Address	Data	Mode	Address	Data
Read array	Write	x	FFh			
Clear status register	Write	x	50h			
Program	Write	WA	40h	Write	WA	WD
Block erase	Write	x	20h	Write	BA	D0h
Lock bit program	Write	BT	77h	Write	BT	D0h
Read lock bit status	Write	x	71h	Write	BT	D0h
Block blank check	Write	x	25h	Write	BA	D0h

WA: Write address

WD: Write data

BA: Any block address

BT: Starting block address

x: Any address in the user ROM area

#### 25.4.11.1 Read Array Command

The read array command is used to read the flash memory.

When FFh is written in the first bus cycle, the MCU enters read array mode. When the read address is input in the following bus cycles, the content of the specified address can be read in 8-bit units.

Since read array mode remains until another command is written, the contents of multiple addresses can be read continuously.

In addition, after a reset, the MCU enters read array mode after programming or block erasure or after entering erase-suspend.

#### 25.4.11.2 Clear Status Register Command

The clear status register command is used to set bits FST4 and FST5 in the FST register to 0.

When 50h is written in the first bus cycle, bits FST4 and FST5 in the FST register are set to 0.

### 25.4.11.3 Program Command

The program command is used to write data to the flash memory in 1-byte units.

When 40h is written in the first bus cycle and data is written in the second bus cycle to the write address, auto-programming (data program and verify operation) starts. Make sure the address value specified in the first bus cycle is the same address as the write address specified in the second bus cycle.

The FST7 bit in the FST register can be used to confirm whether auto-programming has completed. The FST7 bit is set to 0 during auto-programming and is set to 1 when auto-programming completes.

After auto-programming has completed, the auto-program result can be confirmed by the FST4 bit in the FST register. (Refer to **25.4.12 Full Status Check**.)

Do not write additions to the already programmed addresses.

The program command targeting each block in the program ROM can be disabled using the lock bit.

The following commands are not accepted under the following conditions:

- Block erase commands targeting data flash block A when the FMR14 bit in the FMR1 register is set to 1 (rewrite disabled).
- Block erase commands targeting data flash block B when the FMR15 bit is set to 1 (rewrite disabled).
- Block erase commands targeting data flash block C when the FMR16 bit is set to 1 (rewrite disabled).
- Block erase commands targeting data flash block D when the FMR17 bit is set to 1 (rewrite disabled).

Figure 25.8 shows a Program Flowchart (Flash Ready Status Interrupt Disabled) and Figure 25.9 shows a Program Flowchart (Flash Ready Status Interrupt Enabled).

In EW1 mode, do not execute this command to any address where a rewrite control program is allocated.

When the RDYSTIE bit in the FMR0 register is set to 1 (flash ready status interrupt enabled), a flash ready status interrupt can be generated upon completion of auto-programming. The auto-program result can be confirmed by reading the FST register during the interrupt routine.

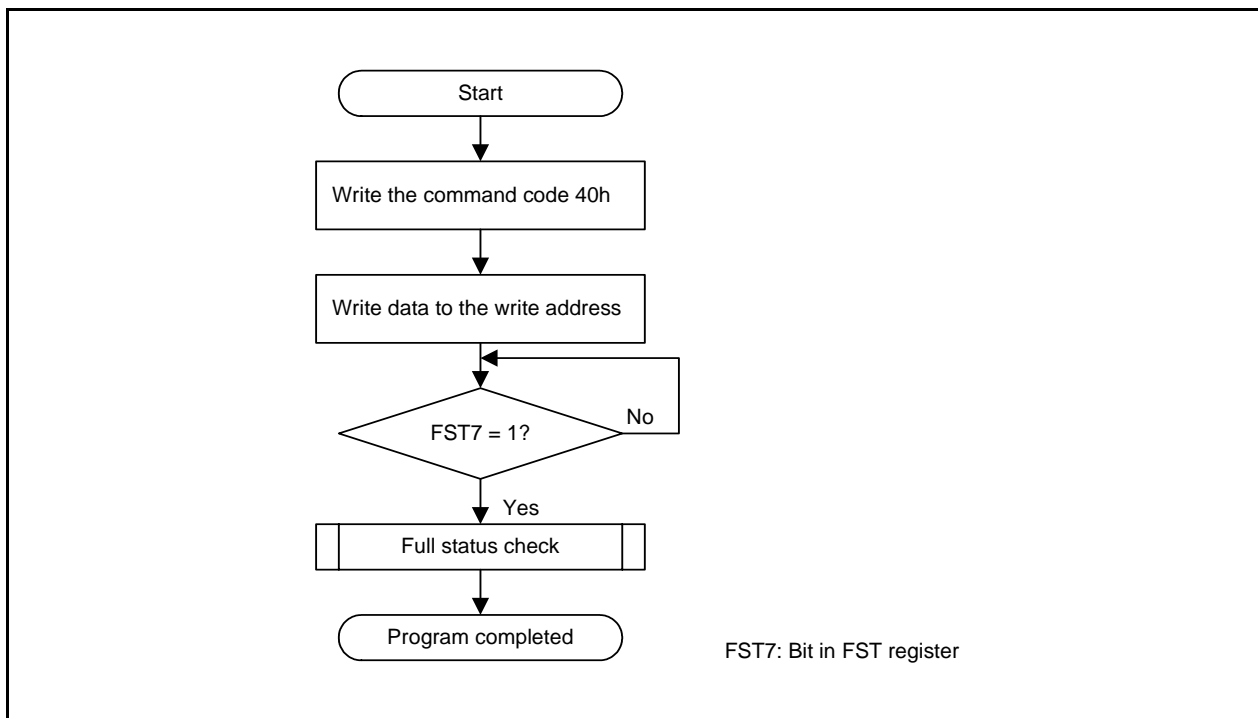

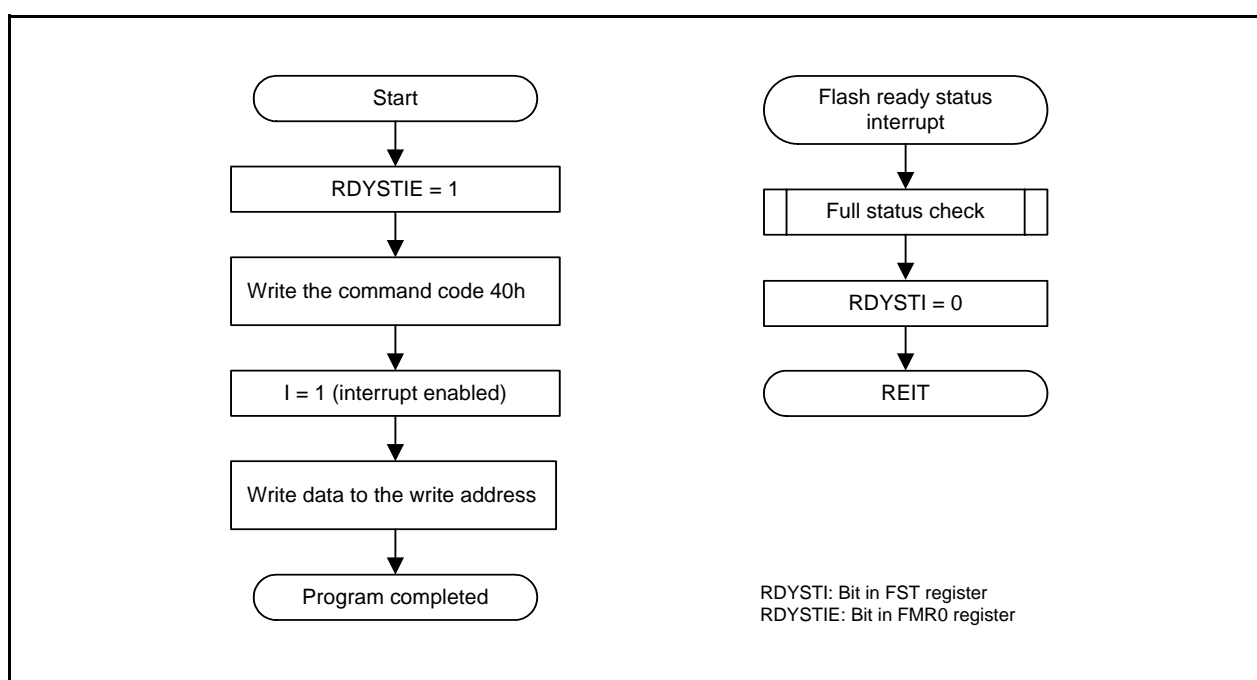

Figure 25.8 Program Flowchart (Flash Ready Status Interrupt Disabled)

**Figure 25.9 Program Flowchart (Flash Ready Status Interrupt Enabled)**

#### 25.4.11.4 Block Erase Command

When 20h is written in the first bus cycle and then D0h is written in the second bus cycle to any block address, auto-erase (erase and erase verify operation) starts in the specified block.

The FST7 bit in the FST register can be used to confirm whether auto-erase has completed. The FST7 bit is set to 0 during auto-erase and is set to 1 when auto-erase completes. After auto-erase completes, all data in the block is set to FFh.

After auto-erase has completed, the auto-erase result can be confirmed by the FST5 bit in the FST register. (Refer to **25.4.12 Full Status Check**.)

The block erase command targeting each block in the program ROM can be disabled using the lock bit.

The following commands are not accepted under the following conditions:

- Block erase commands targeting data flash block A when the FMR14 bit in the FMR1 register is set to 1 (rewrite disabled).
- Block erase commands targeting data flash block B when the FMR15 bit is set to 1 (rewrite disabled).
- Block erase commands targeting data flash block C when the FMR16 bit is set to 1 (rewrite disabled).
- Block erase commands targeting data flash block D when the FMR17 bit is set to 1 (rewrite disabled).

Figure 25.10 shows a Block Erase Flowchart (Flash Ready Status Interrupt Disabled), Figure 25.11 shows a Block Erase Flowchart (Flash Ready Status Interrupt Disabled and Suspend Enabled), and Figure 25.12 shows a Block Erase Flowchart (Flash Ready Status Interrupt Enabled and Suspend Enabled).

In EW1 mode, do not execute this command to any block where a rewrite control program is allocated.

While the RDYSTIE bit in the FMR0 register is set to 1 (flash ready status interrupt enabled), a flash ready status interrupt can be generated upon completion of auto-erase. While the RDYSTIE bit is set to 1 and the FMR20 bit in the FMR2 register is set to 1 (erase-suspend enabled), a flash ready status interrupt is generated when the FMR21 bit is set to 1 (erase-suspend request) and auto-erase suspends. The auto-erase result can be confirmed by reading the FST register during the interrupt routine.

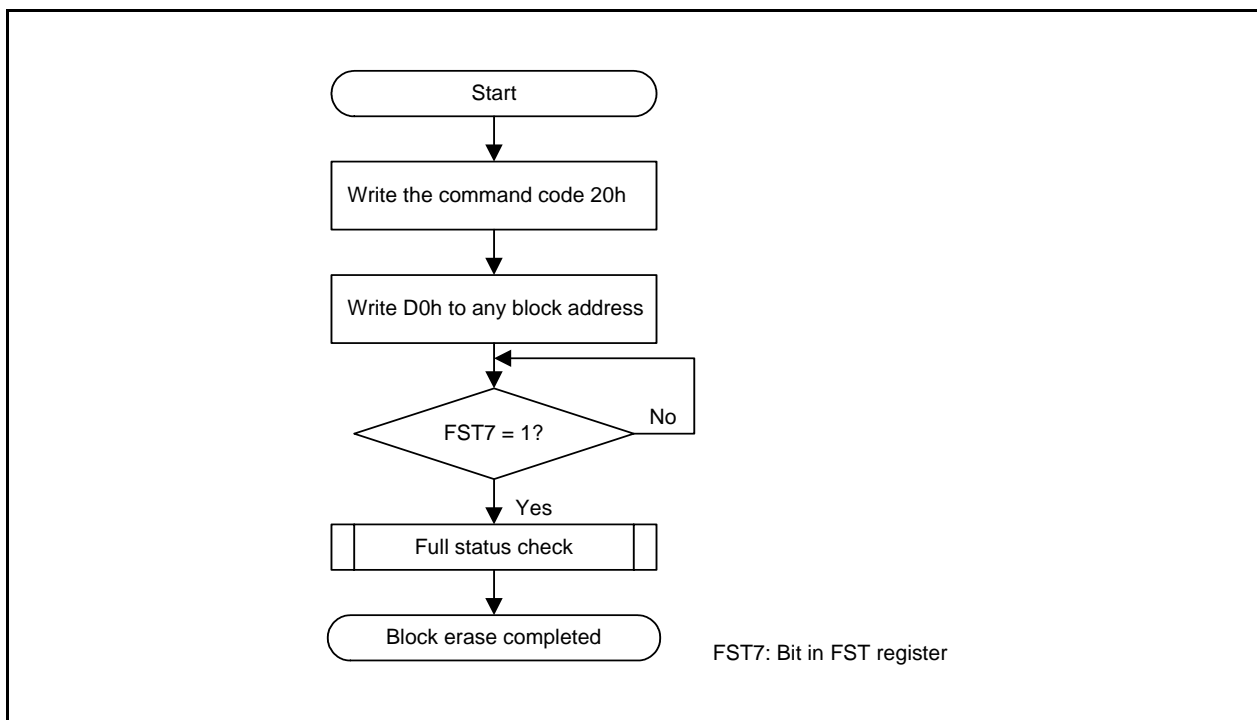

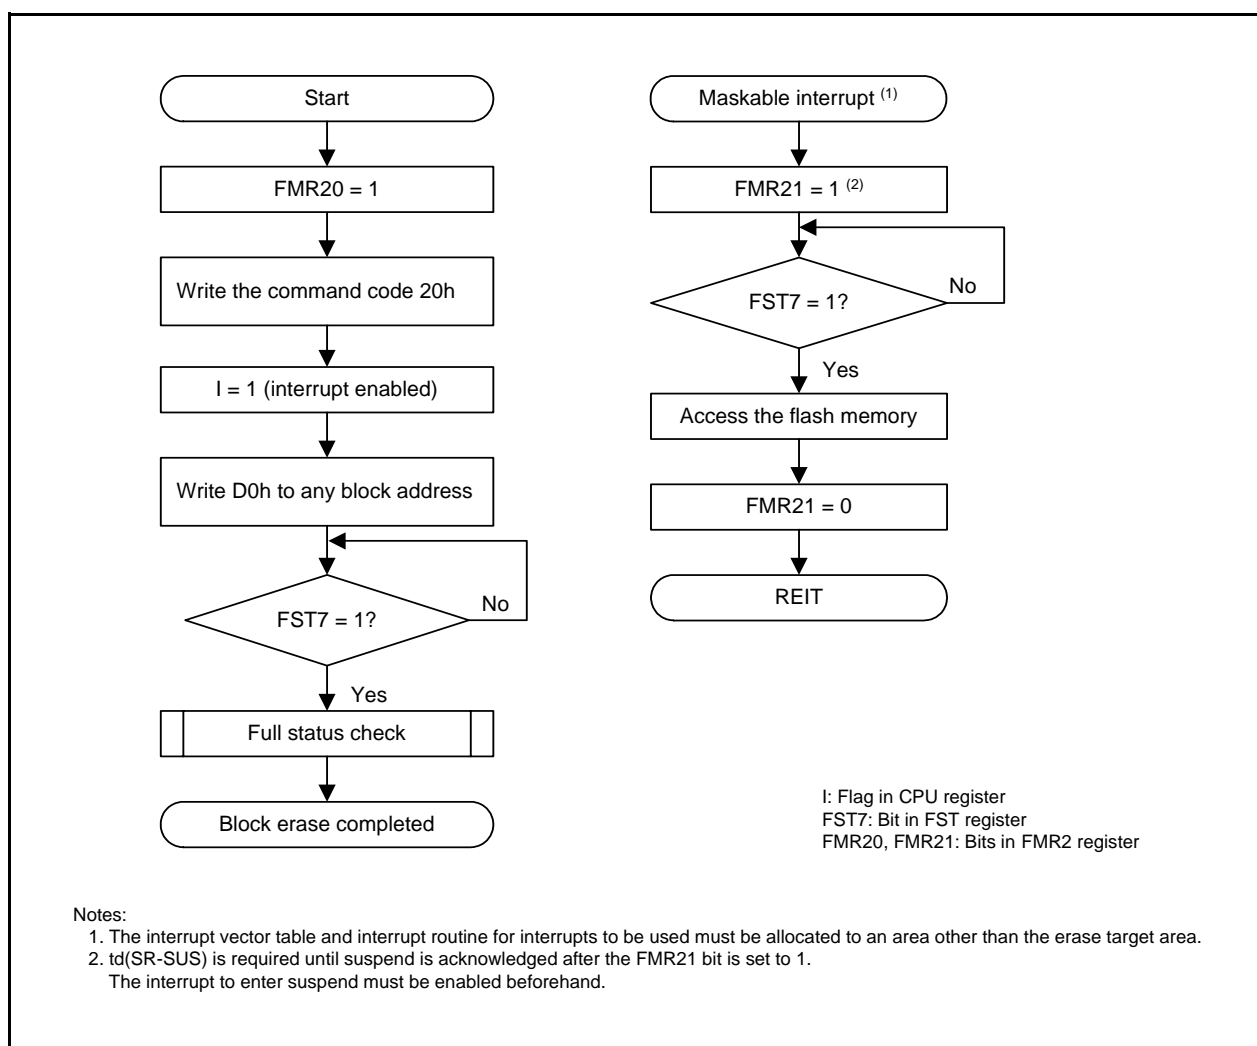

Figure 25.10 Block Erase Flowchart (Flash Ready Status Interrupt Disabled)

**Figure 25.11 Block Erase Flowchart (Flash Ready Status Interrupt Disabled and Suspend Enabled)**

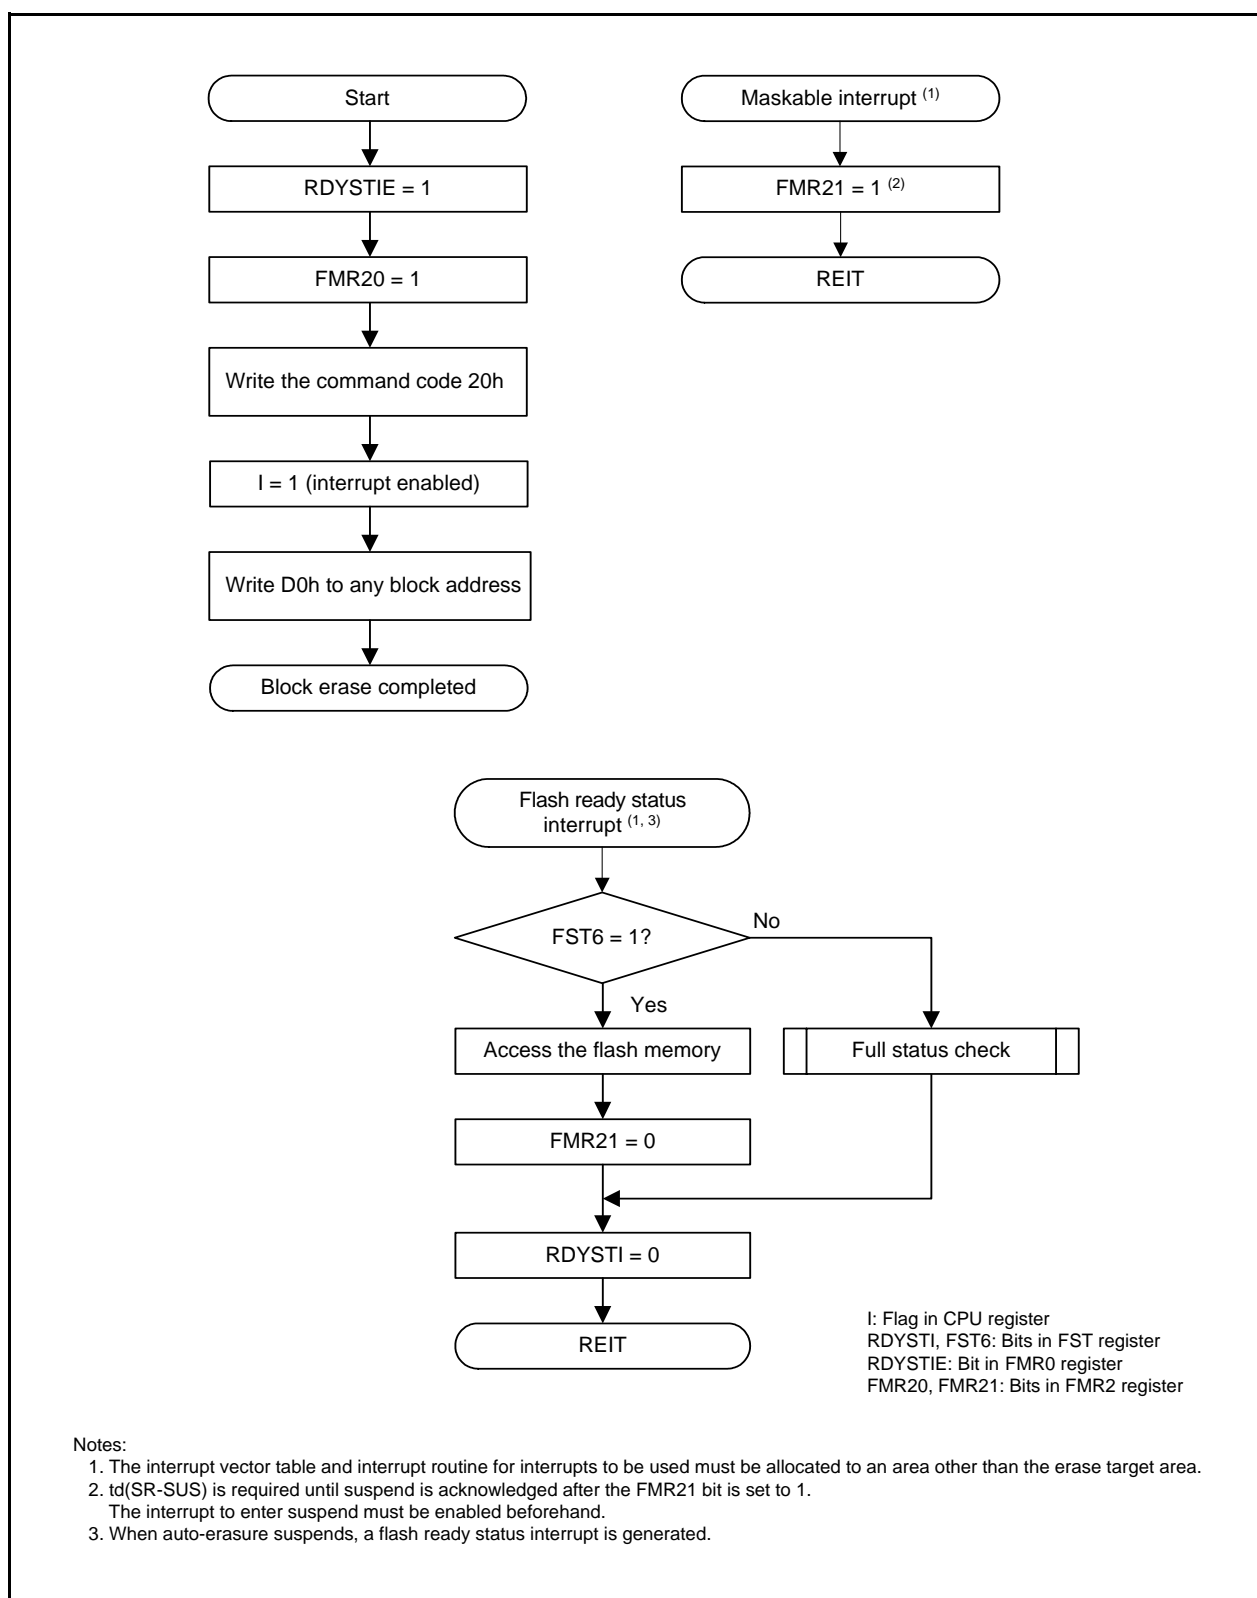

Figure 25.12 Block Erase Flowchart (Flash Ready Status Interrupt Enabled and Suspend Enabled)

### 25.4.11.5 Lock Bit Program Command

This command is used to set the lock bit of any block in the program ROM area to 0 (locked).

When 77h is written in the first bus cycle and D0h is written in the second bus cycle to the starting block address, 0 is written to the lock bit of the specified block. Make sure the address value in the first bus cycle is the same address as the starting block address specified in the second bus cycle.

Figure 25.13 shows a Lock Bit Program Flowchart. The lock bit status (lock bit data) can be read using the read lock bit status command.

The FST7 bit in the FST register can be used to confirm whether writing to the lock bit has completed.

Refer to **25.4.10 Data Protect Function** for the lock bit function and how to set the lock bit to 1 (not locked).

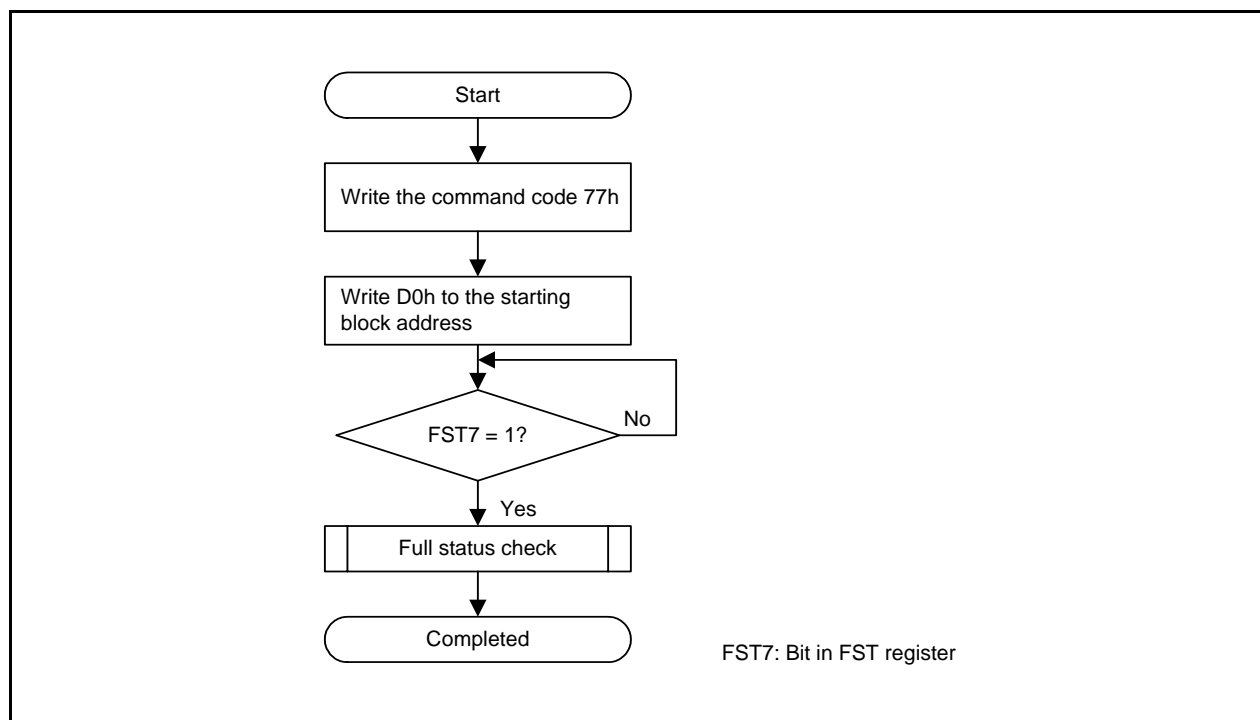

Figure 25.13 Lock Bit Program Flowchart

### 25.4.11.6 Read Lock Bit Status Command

This command is used to read the lock bit status of any address in the program ROM area.

When 71h written in the first bus cycle and D0h is written in the second cycle to the starting block address, the lock bit status of the specified block is stored in the LBDATA bit in the FST register. After the FST7 bit in the FST register has been set to 1 (ready), read the LBDATA bit.

Figure 25.14 shows a Read Lock Bit Status Flowchart.

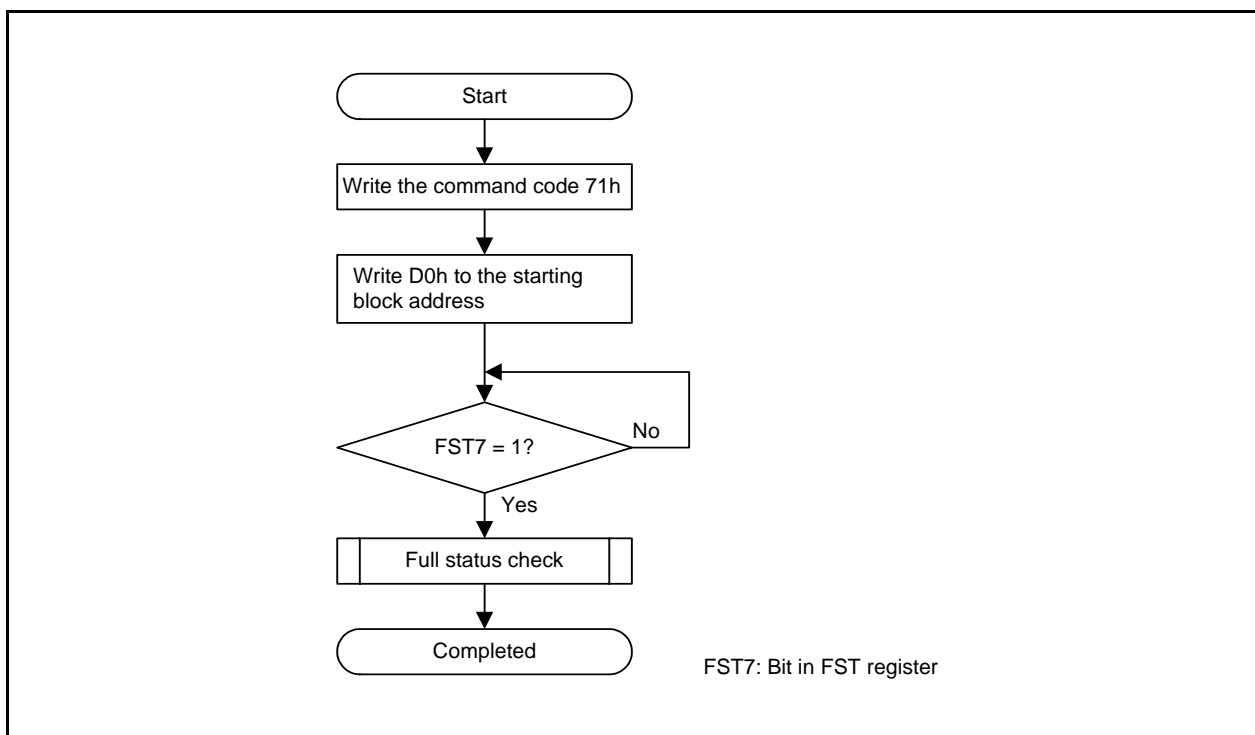

Figure 25.14 Read Lock Bit Status Flowchart

### 25.4.11.7 Block Blank Check Command

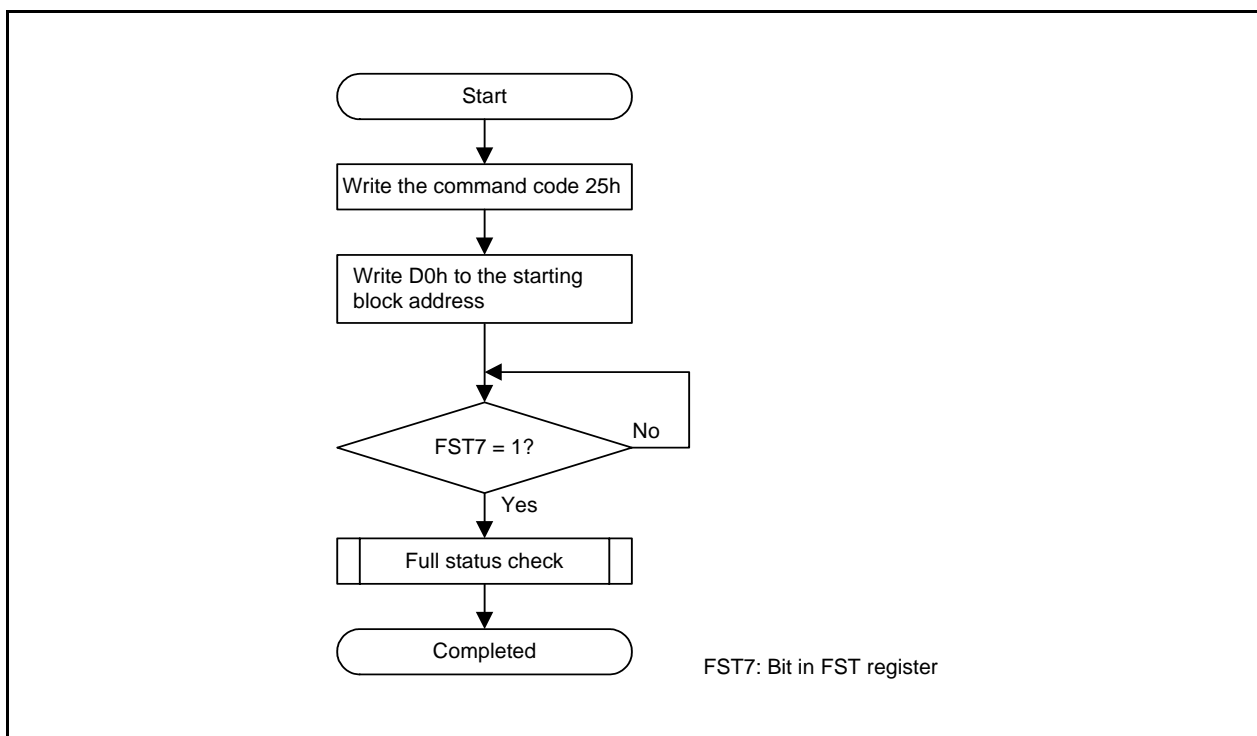

This command is used to confirm that all addresses in any block are blank data FFh.

When 25h is written in the first bus cycle and D0h is written in the second bus cycle to any block address, blank checking starts in the specified block. The FST7 bit in the FST register can be used to confirm whether blank checking has completed. The FST7 bit is set to 0 during the blank-check period and set to 1 when blank checking completes.

After blank checking has completed, the blank-check result can be confirmed by the FST5 bit in the FST register. (Refer to **25.4.12 Full Status Check**.) This command is used to verify the target block has not been written to. To confirm whether erasure has completed normally, execute the full status check.

Do not execute the block blank check command when the FST6 bit is set to 1 (during erase-suspend).

Figure 25.15 shows a Block Blank Check Flowchart.

**Figure 25.15 Block Blank Check Flowchart**

This command is intended for programmer manufacturers, not for general users.

### 25.4.12 Full Status Check

If an error occurs, bits FST4 and FST5 in the FST register are set to 1, indicating the occurrence of an error. The execution result can be confirmed by checking these status bits (full status check).

Table 25.6 lists the Errors and FST Register Status. Figure 25.16 shows the Full Status Check and Handling Procedure for Individual Errors.

**Table 25.6 Errors and FST Register Status**

FST Register Status		Error	Error Occurrence Condition
FST5	FST4		
1	1	Command sequence error	<ul style="list-style-type: none"> <li>• When a command is not written correctly.</li> <li>• When data other than valid data (i.e., D0h or FFh) is written in the second bus cycle of the block erase command. <sup>(1)</sup></li> <li>• The erase command is executed during suspend.</li> <li>• The command is executed to the block during suspend.</li> </ul>
1	0	Erase error	When the block erase command is executed, but auto-erasure does not complete correctly.
		Blank check error	When the block blank check command is executed and data other than blank data FFh is read.
0	1	Program error/ lock bit program error	When the program command is executed, but auto-programming does not complete correctly.

Note:

1. When FFh is written in the second bus cycle of these commands, the MCU enters read array mode. At the same time, the command code written in the first bus cycle is invalid.

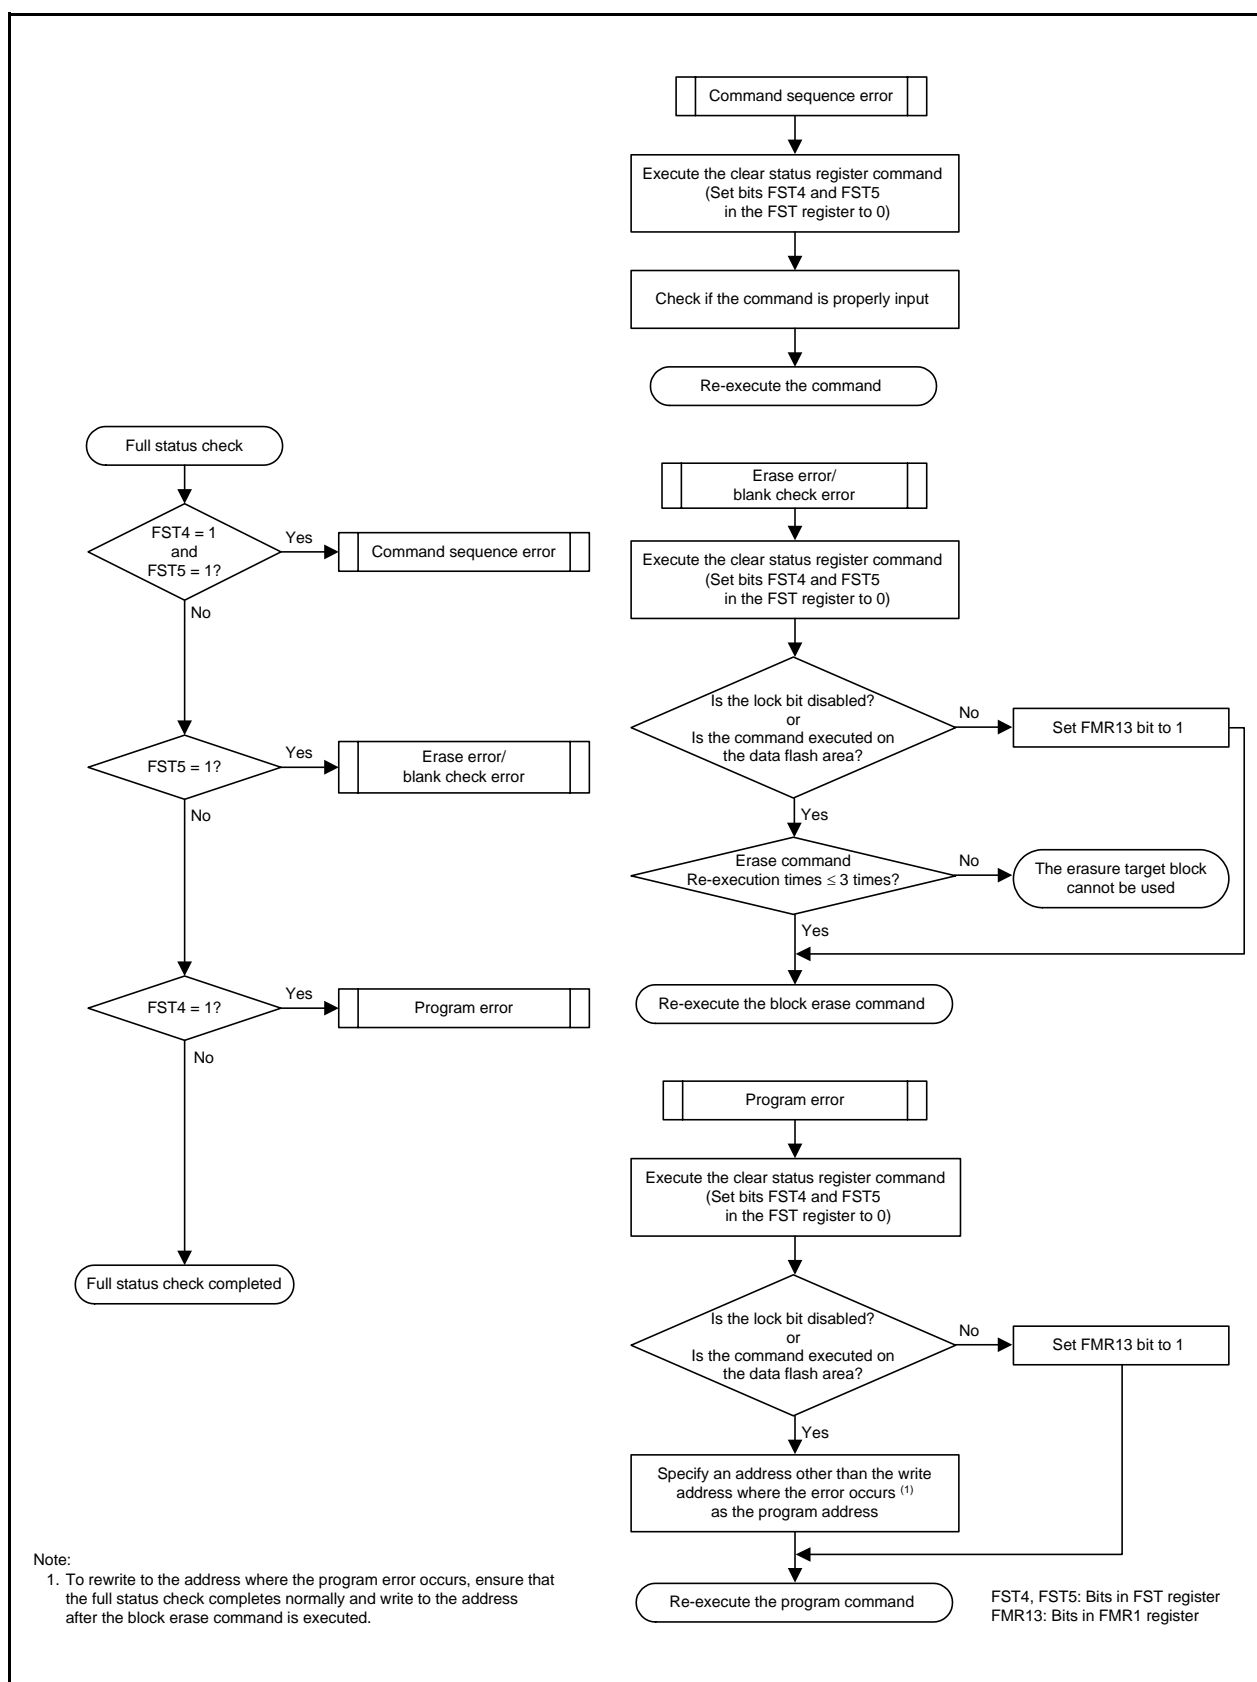

Figure 25.16 Full Status Check and Handling Procedure for Individual Errors

## 25.5 Standard Serial I/O Mode

In standard serial I/O mode, a serial programmer which supports the MCU can be used to rewrite the user ROM area while the MCU is mounted on-board.

There are three types of standard serial I/O modes:

- Standard serial I/O mode 1 ..... Clock synchronous serial I/O used to connect to a serial programmer
  - Standard serial I/O mode 2 ..... Clock asynchronous serial I/O used to connect to a serial programmer
  - Standard serial I/O mode 3 ..... Special clock asynchronous serial I/O used to connect to a serial programmer
- Standard serial I/O mode 2 and standard serial I/O mode 3 can be used for the MCU.

Refer to **Appendix 2. Connection Examples between Serial Programmer and On-Chip Debugging Emulator** for examples of connecting to a serial programmer. Contact the serial programmer manufacturer for more information. Refer to the user's manual included with your serial programmer for instructions.

Table 25.7 lists the Pin Functions (Flash Memory Standard Serial I/O Mode 2) and Figure 25.17 shows Pin Handling in Standard Serial I/O Mode 2. Table 25.8 lists the Pin Functions (Flash Memory Standard Serial I/O Mode 3) and Figure 25.18 shows Pin Handling in Standard Serial I/O Mode 3.

After handling the pins shown in Table 25.8 and rewriting the flash memory using the programmer, apply a "H" level signal to the MODE pin and reset the hardware to run a program in the flash memory in single-chip mode.

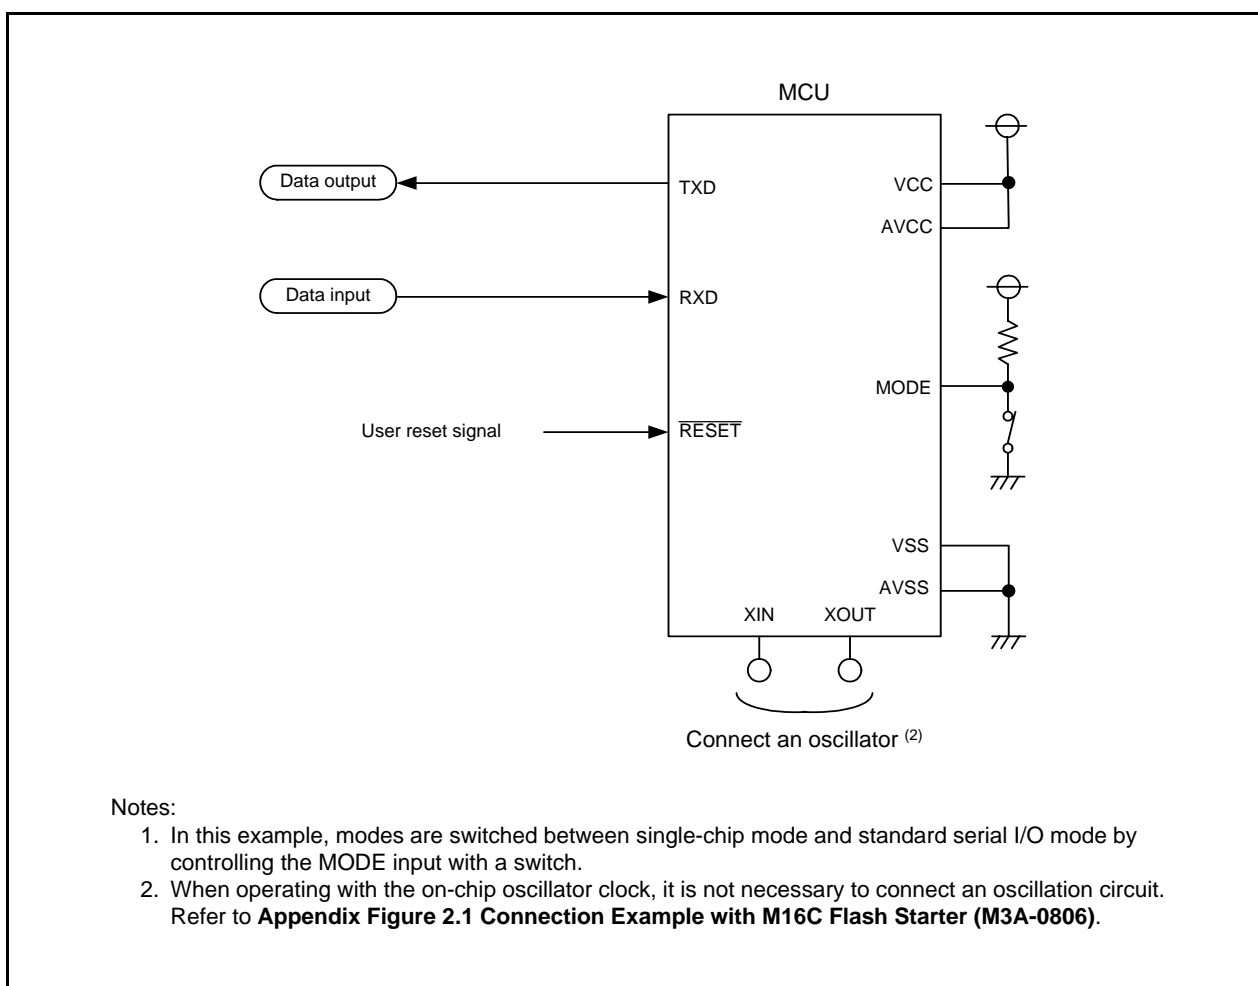

### 25.5.1 ID Code Check Function

The ID code check function determines whether the ID codes sent from the serial programmer and those written in the flash memory match.

Refer to **12. ID Code Areas** for details of the ID code check.

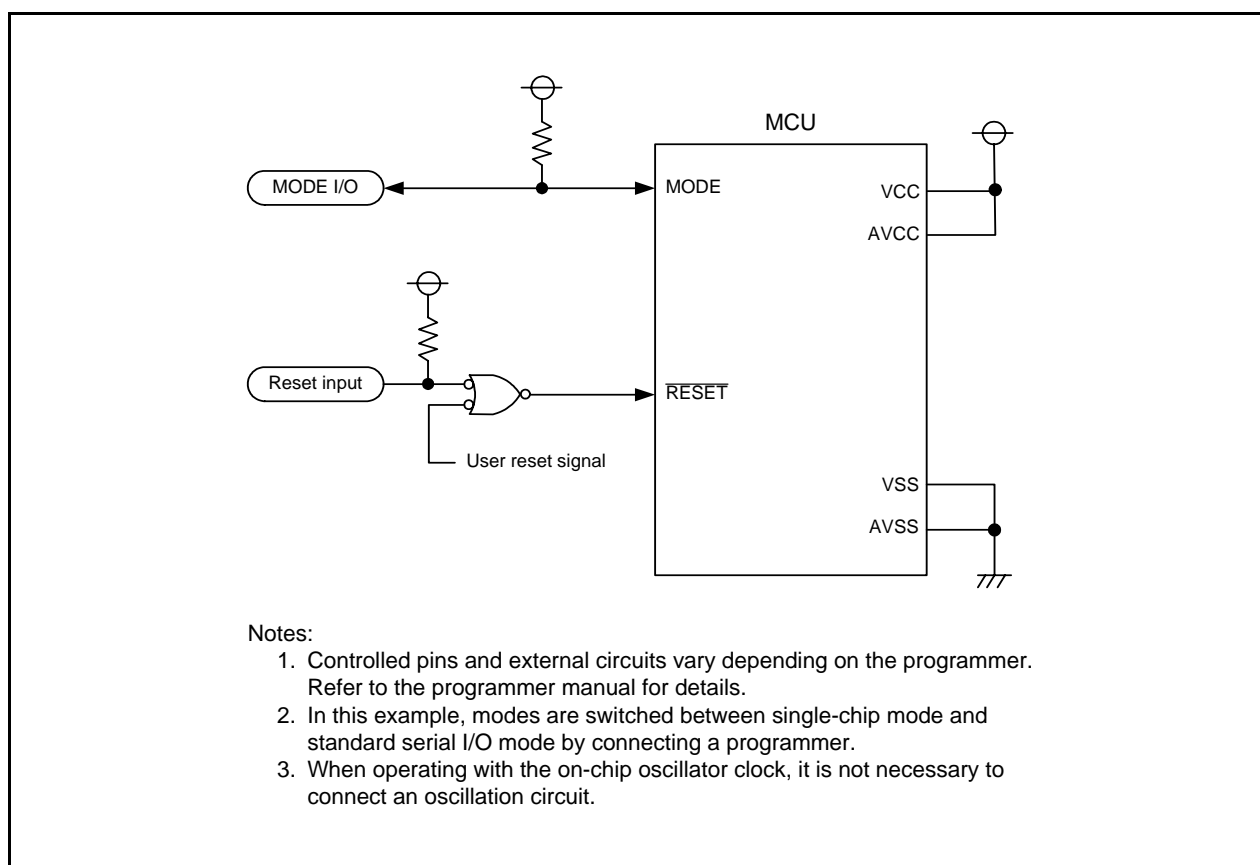

**Table 25.7 Pin Functions (Flash Memory Standard Serial I/O Mode 2)**

Pin	Name	I/O	Description
VCC, VSS	Power supply input		Apply the guaranteed programming and erasure voltage to the VCC pin and 0 V to the VSS pin.
$\overline{\text{RESET}}$	Reset input	I	Reset input pin
P4_6/XIN	P4_6 input/clock input	I	Connect a ceramic resonator or crystal oscillator between pins XIN and XOUT.
P4_7/XOUT	P4_7 input/clock output	I/O	
P0_0 to P0_7	Input port P0	I	Input a "H" or "L" level signal or leave open.
P1_0 to P1_3, P1_6, P1_7	Input port P1	I	Input a "H" or "L" level signal or leave open.
P2_0 to P2_2	Input port P2	I	Input a "H" or "L" level signal or leave open.
P3_1, P3_3 to P3_5, P3_7	Input port P3	I	Input a "H" or "L" level signal or leave open.
P4_2/VREF, P4_5	Input port P4	I	Input a "H" or "L" level signal or leave open.
MODE	MODE	I/O	Input a "L" level signal.
P1_4	TXD output	O	Serial data output pin
P1_5	RXD input	I	Serial data input pin

**Figure 25.17 Pin Handling in Standard Serial I/O Mode 2**

**Table 25.8 Pin Functions (Flash Memory Standard Serial I/O Mode 3)**

Pin	Name	I/O	Description
VCC, VSS	Power supply input		Apply the guaranteed programming and erasure voltage to the VCC pin and 0 V to the VSS pin.
$\overline{\text{RESET}}$	Reset input	I	Reset input pin
P4_6/XIN	P4_6 input/clock input	I	If an external oscillator is connected, connect a ceramic resonator or crystal oscillator between pins XIN and XOUT. To use as an input port, input a "H" or "L" level signal or leave the pin open.
P4_7/XOUT	P4_7 input/clock output	I/O	
P0_0 to P0_7	Input port P0	I	Input a "H" or "L" level signal or leave open.
P1_0 to P1_7	Input port P1	I	Input a "H" or "L" level signal or leave open.
P2_0 to P2_2	Input port P2	I	Input a "H" or "L" level signal or leave open.
P3_1, P3_3 to P3_5, P3_7	Input port P3	I	Input a "H" or "L" level signal or leave open.
P4_2/VREF, P4_5	Input port P4	I	Input a "H" or "L" level signal or leave open.
MODE	MODE	I/O	Serial data I/O pin. Connect the pin to a programmer.

**Figure 25.18 Pin Handling in Standard Serial I/O Mode 3**

## 25.6 Parallel I/O Mode

Parallel I/O mode is used to input and output software commands, addresses and data necessary to control (read, program, and erase) the on-chip flash memory.

Use a parallel programmer which supports the MCU. Contact the parallel programmer manufacturer for more information. Refer to the user's manual included with your parallel programmer for instructions.

In parallel I/O mode, the user ROM areas shown in Figure 25.1 can be rewritten.

### 25.6.1 ROM Code Protect Function

The ROM code protect function prevents the flash memory from being read and rewritten. (Refer to **25.3.2 ROM Code Protect Function**.)

## 25.7 Notes on Flash Memory

### 25.7.1 CPU Rewrite Mode

#### 25.7.1.1 Prohibited Instructions

The following instructions cannot be used while the program ROM area is being rewritten in EW0 mode because they reference data in the flash memory: UND, INTO, and BRK.

#### 25.7.1.2 Interrupts

Tables 25.9 to 25.11 list CPU Rewrite Mode Interrupts.

**Table 25.9 CPU Rewrite Mode Interrupts (1)**

Mode	Erase/ Write Target	Status	Maskable Interrupt
EW0	Data flash	During auto-erase (suspend enabled)	When an interrupt request is acknowledged, interrupt handling is executed. If the FMR22 bit is set to 1 (erase-suspend request enabled by interrupt request), the FMR21 bit is automatically set to 1 (erase-suspend request). The flash memory suspends auto-erase after td(SR-SUS). If erase-suspend is required while the FMR22 bit is set to 0 (erase-suspend request disabled by interrupt request), set the FMR21 bit to 1 during interrupt handling. The flash memory suspends auto-erase after td(SR-SUS). While auto-erase is being suspended, any block other than the block during auto-erase execution can be read or written. Auto-erase can be restarted by setting the FMR21 bit to 0 (erase restart).
		During auto-erase (suspend disabled or FMR22 = 0)	Interrupt handling is executed while auto-erase or auto-programming is being performed.
		During auto-programming	
	Program ROM	During auto-erase (suspend enabled)	Usable by allocating a vector in RAM.
		During auto-erase (suspend disabled)	
		During auto-programming	
EW1	Data flash	During auto-erase (suspend enabled)	When an interrupt request is acknowledged, interrupt handling is executed. If the FMR22 bit is set to 1, the FMR21 bit is automatically set to 1. The flash memory suspends auto-erase after td(SR-SUS). If erase-suspend is required while the FMR22 bit is set to 0, set the FMR21 bit to 1 during interrupt handling. The flash memory suspends auto-erase after td(SR-SUS). While auto-erase is being suspended, any block other than the block during auto-erase execution can be read or written. Auto-erase can be restarted by setting the FMR21 bit to 0.
		During auto-erase (suspend disabled or FMR22 = 0)	Interrupt handling is executed while auto-erase or auto-programming is being performed.
		During auto-programming	
	Program ROM	During auto-erase (suspend enabled)	Auto-erase suspends after td(SR-SUS) and interrupt handling is executed. Auto-erase can be restarted by setting the FMR21 bit to 0 after interrupt handling completes. While auto-erase is being suspended, any block other than the block during auto-erase execution can be read or written.
		During auto-erase (suspend disabled or FMR22 = 0)	Auto-erase and auto-programming have priority and interrupt requests are put on standby. Interrupt handling is executed after auto-erase and auto-program complete.
		During auto-programming	

FMR21, FMR22: Bits in FMR2 register

**Table 25.10 CPU Rewrite Mode Interrupts (2)**

Mode	Erase/ Write Target	Status	<ul style="list-style-type: none"> <li>• Watchdog Timer</li> <li>• Oscillation Stop Detection</li> <li>• Voltage Monitor 2</li> <li>• Voltage Monitor 1</li> </ul> (Note 1)	<ul style="list-style-type: none"> <li>• Undefined Instruction</li> <li>• INTO Instruction</li> <li>• BRK Instruction</li> <li>• Single Step</li> <li>• Address Match</li> <li>• Address Break</li> </ul> (Note 1)
EW0	Data flash	During auto-erase (suspend enabled)	<p>When an interrupt request is acknowledged, interrupt handling is executed.</p> <p>If the FMR22 bit is set to 1 (erase-suspend request enabled by interrupt request), the FMR21 bit is automatically set to 1 (erase-suspend request). The flash memory suspends auto-erase after td(SR-SUS). If erase-suspend is required while the FMR22 bit is set to 0 (erase-suspend request disabled by interrupt request), set the FMR21 bit to 1 during interrupt handling. The flash memory suspends auto-erase after td(SR-SUS). While auto-erase is being suspended, any block other than the block during auto-erase execution can be read or written. Auto-erase can be restarted by setting the FMR21 bit is set to 0 (erase restart).</p>	<p>When an interrupt request is acknowledged, interrupt handling is executed.</p> <p>If erase-suspend is required, set the FMR21 bit to 1 during interrupt handling. The flash memory suspends auto-erase after td(SR-SUS). While auto-erase is being suspended, any block other than the block during auto-erase execution can be read or written. Auto-erase can be restarted by setting the FMR21 bit in the FMR2 register is set to 0 (erase restart).</p>
		During auto-erase (suspend disabled or FMR22 = 0)	Interrupt handling is executed while auto-erase or auto-programming is being performed.	
		During auto-programming		
	Program ROM	During auto-erase (suspend enabled)	<p>When an interrupt request is acknowledged, auto-erase or auto-programming is forcibly stopped immediately and the flash memory is reset. Interrupt handling starts when the flash memory restarts after the fixed period. Since the block during auto-erase or the address during auto-programming is forcibly stopped, the normal value may not be read. After the flash memory restarts, execute auto-erase again and ensure it completes normally.</p> <p>The watchdog timer does not stop during the command operation, so interrupt requests may be generated. Initialize the watchdog timer regularly using the erase-suspend function.</p>	Not usable during auto-erase or auto-programming.
		During auto-erase (suspend disabled)		
		During auto-programming		

FMR21, FMR22: Bits in FMR2 register

Note:

1. Do not use a non-maskable interrupt while block 0 is being auto-erased because the fixed vector is allocated in block 0.

**Table 25.11 CPU Rewrite Mode Interrupts (3)**

Mode	Erase/ Write Target	Status	<ul style="list-style-type: none"> <li>• Watchdog Timer</li> <li>• Oscillation Stop Detection</li> <li>• Voltage Monitor 2</li> <li>• Voltage Monitor 1</li> </ul> (Note 1)	<ul style="list-style-type: none"> <li>• Undefined Instruction</li> <li>• INTO Instruction</li> <li>• BRK Instruction</li> <li>• Single Step</li> <li>• Address Match</li> <li>• Address Break</li> </ul> (Note 1)
EW1	Data flash	During auto-erase (suspend enabled)	When an interrupt request is acknowledged, interrupt handling is executed. If the FMR22 bit is set to 1 (erase-suspend request enabled by interrupt request), the FMR21 bit is automatically set to 1 (erase-suspend request). The flash memory suspends auto-erase after td(SR-SUS). If erase-suspend is required while the FMR22 bit is set to 0 (erase-suspend request disabled by interrupt request), set the FMR21 bit to 1 during interrupt handling. The flash memory suspends auto-erase after td(SR-SUS). While auto-erase is being suspended, any block other than the block during auto-erase execution can be read or written. Auto-erase can be restarted by setting the FMR21 bit is set to 0 (erase restart).	When an interrupt request is acknowledged, interrupt handling is executed. If erase-suspend is required, set the FMR21 bit to 1 during interrupt handling. The flash memory suspends auto-erase after td(SR-SUS). While auto-erase is being suspended, any block other than the block during auto-erase execution can be read or written. Auto-erase can be restarted by setting the FMR21 bit in the FMR2 register is set to 0 (erase restart).
		During auto-erase (suspend disabled or FMR22 = 0)	Interrupt handling is executed while auto-erase or auto-programming is being performed.	
		During auto-programming		
	Program ROM	During auto-erase (suspend enabled)	When an interrupt request is acknowledged, auto-erase or auto-programming is forcibly stopped immediately and the flash memory is reset. Interrupt handling starts when the flash memory restarts after the fixed period. Since the block during auto-erase or the address during auto-programming is forcibly stopped, the normal value may not be read. After the flash memory restarts, execute auto-erase again and ensure it completes normally. The watchdog timer does not stop during the command operation, so interrupt requests may be generated. Initialize the watchdog timer regularly using the erase-suspend function.	Not usable during auto-erase or auto-programming.
		During auto-erase (suspend disabled or FMR22 = 0)		
		During auto-programming		

FMR21, FMR22: Bits in FMR2 register

Note:

1. Do not use a non-maskable interrupt while block 0 is being auto-erased because the fixed vector is allocated in block 0.

### 25.7.1.3 How to Access

To set one of the following bits to 1, first write 0 and then 1 immediately. Disable interrupts and DTC activation between writing 0 and writing 1.

- The FMR01 bit or FMR02 bit in the FMR0 register
- The FMR13 bit in the FMR1 register
- The FMR20 bit, FMR22 bit, or FMR 27 bit in the FMR2 register

To set one of the following bits to 0, first write 1 and then 0 immediately. Disable interrupts and DTC activation between writing 1 and writing 0.

- The FMR14 bit, FMR15 bit, FMR16 bit, or FMR17 bit in the FMR1 register

### 25.7.1.4 Rewriting User ROM Area

In EW0 mode, if the supply voltage drops while rewriting any block in which a rewrite control program is stored, it may not be possible to rewrite the flash memory because the rewrite control program cannot be rewritten correctly. In this case, use standard serial I/O mode.

### 25.7.1.5 Programming

Do not write additions to the already programmed address.

### 25.7.1.6 Entering Stop Mode or Wait Mode

Do not enter stop mode or wait mode during erase-suspend.

If the FST7 bit in the FST register is set to 0 (busy (during programming or erasure execution), do not enter to stop mode or wait mode.

Do not enter stop mode or wait mode while the FMR27 bit is 1 (low-current-consumption read mode enabled).

### 25.7.1.7 Programming and Erasure Voltage for Flash Memory

To perform programming and erasure, use  $V_{CC} = 2.7\text{ V}$  to  $5.5\text{ V}$  as the supply voltage. Do not perform programming and erasure at less than  $2.7\text{ V}$ .

### 25.7.1.8 Block Blank Check

Do not execute the block blank check command during erase-suspend.

### 25.7.1.9 Low-Current-Consumption Read Mode

In low-speed on-chip oscillator mode, the current consumption when reading the flash memory can be reduced by setting the FMR27 bit in the FMR2 register to 1 (low-current-consumption read mode enabled).

When the CPU clock is set to the low-speed on-chip oscillator clock divided by 4, 8, or 16, low-consumption-current read mode can be used. When divided by 1 (no division) or divided by 2 is set, do not use low-consumption-current read mode. After setting the divide ratio of the CPU clock, set the FMR27 bit to 1.

To reduce the power consumption, refer to **26. Reducing Power Consumption**.

Enter wait mode or stop mode after setting the FMR27 bit to 0 (low-current-consumption read mode disabled).

Do not enter wait mode or stop mode while the FMR27 bit is 1 (low-current-consumption read mode enabled).

## 26. Reducing Power Consumption

### 26.1 Overview

This chapter describes key points and processing methods for reducing power consumption.

### 26.2 Key Points and Processing Methods for Reducing Power Consumption

Key points for reducing power consumption are shown below. They should be referred to when designing a system or creating a program.

#### 26.2.1 Voltage Detection Circuit

If voltage monitor 1 is not used, set the VCA26 bit in the VCA2 register to 0 (voltage detection 1 circuit disabled). If voltage monitor 2 is not used, set the VCA27 bit in the VCA2 register to 0 (voltage detection 2 circuit disabled).

If the power-on reset and voltage monitor 0 reset are not used, set the VCA25 bit in the VCA2 register to 0 (voltage detection 0 circuit disabled).

#### 26.2.2 Ports

Even after the MCU enters wait mode or stop mode, the states of the I/O ports are retained. Current flows into the output ports in the active state, and shoot-through current flows into the input ports in the high-impedance state. Unnecessary ports should be set to input and fixed to a stable electric potential before the MCU enters wait mode or stop mode.

#### 26.2.3 Clocks

Power consumption generally depends on the number of the operating clocks and their frequencies. The fewer the number of operating clocks or the lower their frequencies, the more power consumption decreases. Unnecessary clocks should be stopped accordingly.

Stopping low-speed on-chip oscillator oscillation: CM14 bit in CM1 register

Stopping high-speed on-chip oscillator oscillation: FRA00 bit in FRA0 register

#### 26.2.4 Wait Mode, Stop Mode

Power consumption can be reduced in wait mode and stop mode. Refer to **9.6 Power Control** for details.

#### 26.2.5 Stopping Peripheral Function Clocks

If the peripheral function f1, f2, f4, f8, and f32 clocks are not necessary in wait mode, set the CM02 bit in the CM0 register to 1 (peripheral function clock stops in wait mode). This will stop the f1, f2, f4, f8, and f32 clocks in wait mode.

#### 26.2.6 Timers

If timer RA is not used, set the TCKCUT bit in the TRAMR register to 1 (count source cutoff).

If timer RB is not used, set the TCKCUT bit in the TRBMR register to 1 (count source cutoff).

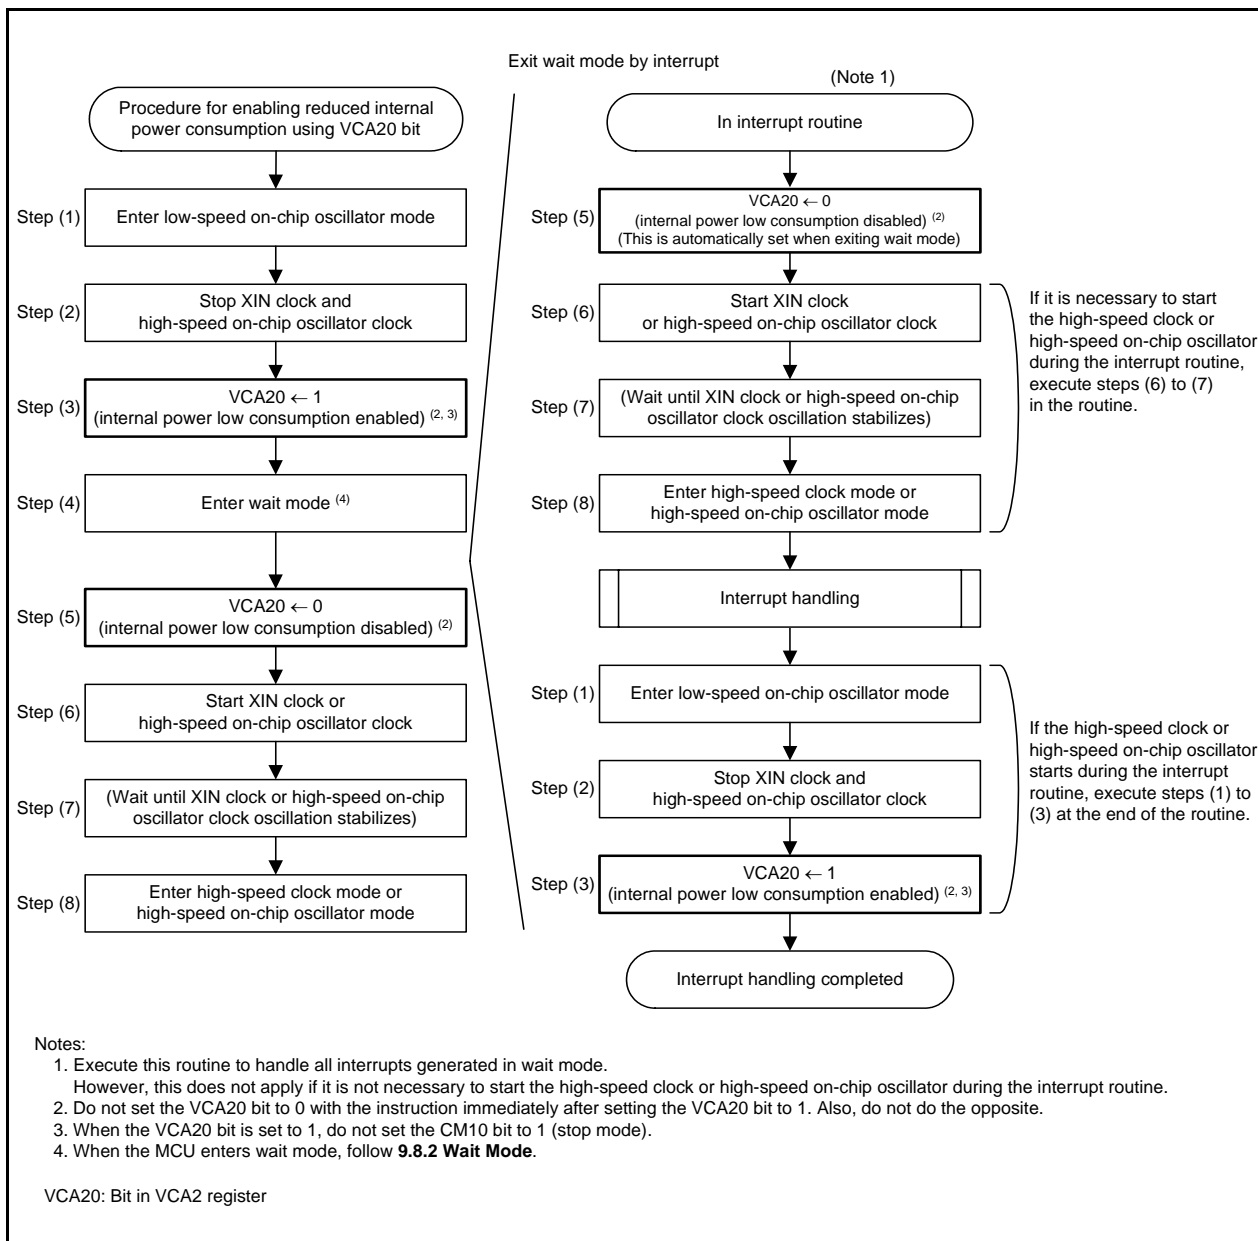

If timer RC is not used, set the MSTTRC bit in the MSTCR register to 1 (standby).

#### 26.2.7 A/D Converter

When the A/D converter is not used, power consumption can be reduced by setting the ADSTBY bit in the ADCON1 register to 0 (A/D operation stops (standby)) to shut off any analog circuit current flow.

### 26.2.8 Reducing Internal Power Consumption

When the MCU enters wait mode using low-speed on-chip oscillator mode, internal power consumption can be reduced by using the VCA20 bit in the VCA2 register. Figure 26.1 shows the Handling Procedure for Reducing Internal Power Consumption Using VCA20 Bit. To enable reduced internal power consumption by the VCA20 bit, follow Figure 26.1 Handling Procedure for Reducing Internal Power Consumption Using VCA20 Bit.

**Figure 26.1 Handling Procedure for Reducing Internal Power Consumption Using VCA20 Bit**

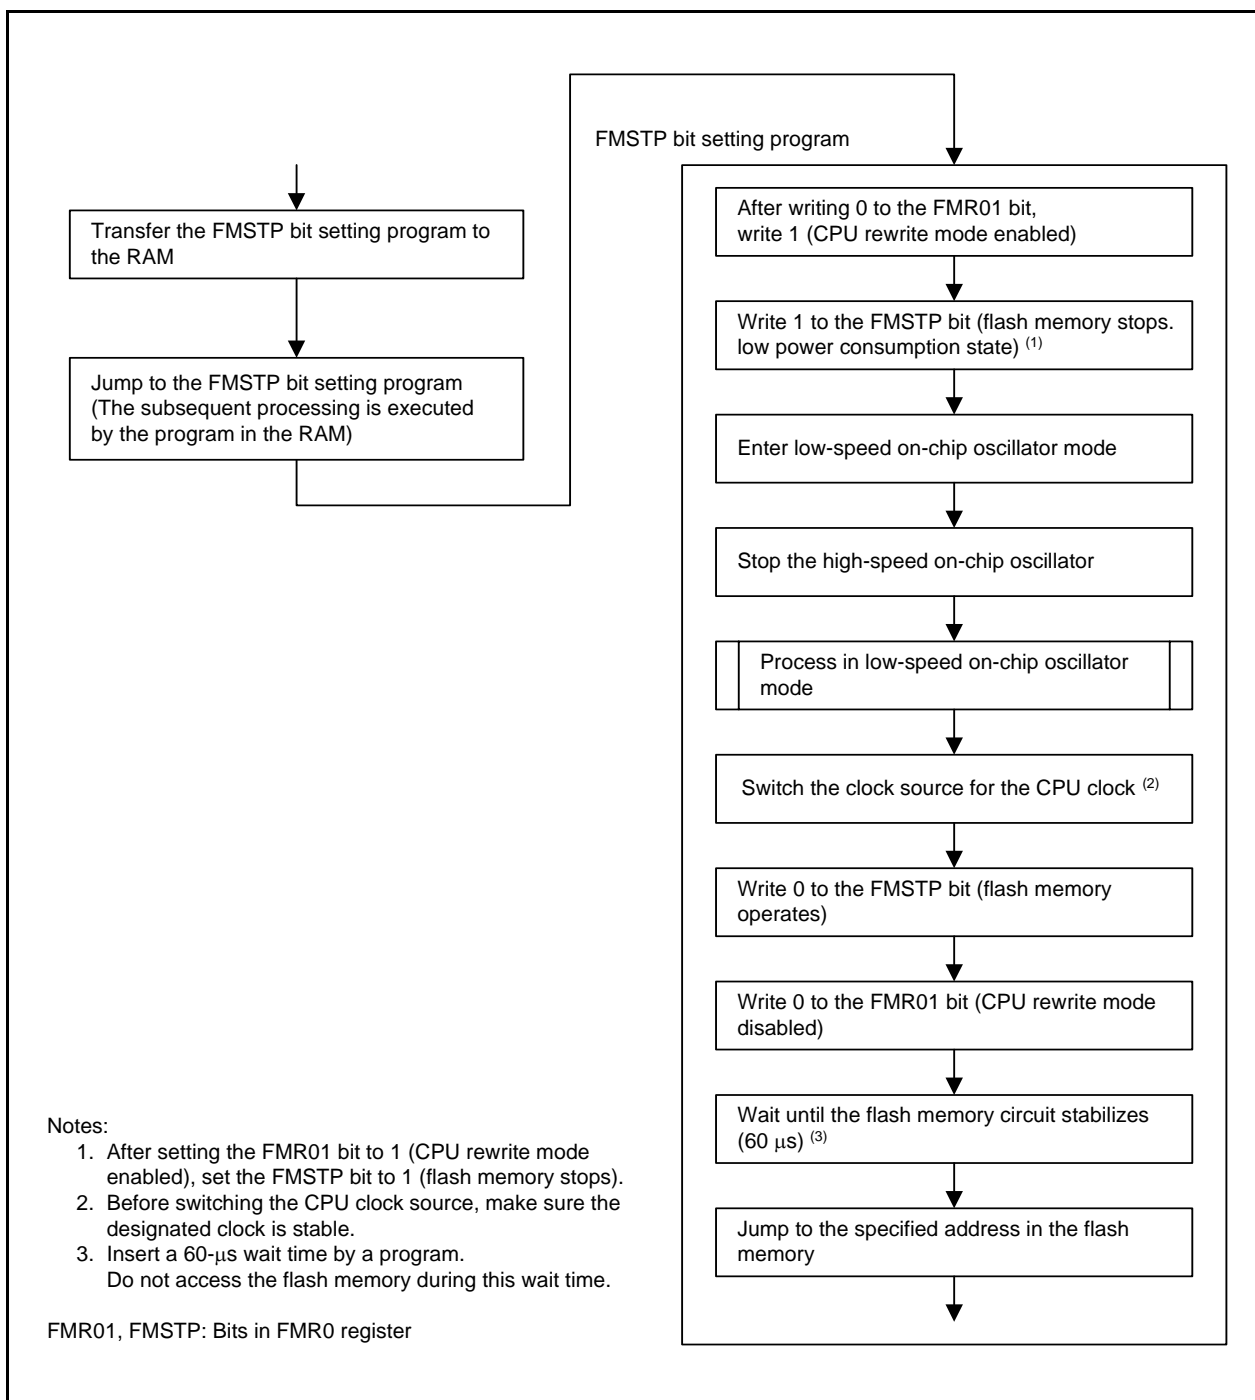

### 26.2.9 Stopping Flash Memory

In low-speed on-chip oscillator mode, power consumption can be further reduced by stopping the flash memory using the FMSTP bit in the FMR0 register.

Access to the flash memory is disabled by setting the FMSTP bit to 1 (flash memory stops). The FMSTP bit must be written to by a program transferred to RAM.

When the MCU enters stop mode or wait mode while CPU rewrite mode is disabled, the power for the flash memory is automatically turned off. It is turned back on again after the MCU exits stop mode or wait mode. This eliminates the need to set the FMR0 register.

Figure 26.2 shows the Handling Procedure Example for Reducing Power Consumption Using FMSTP Bit.

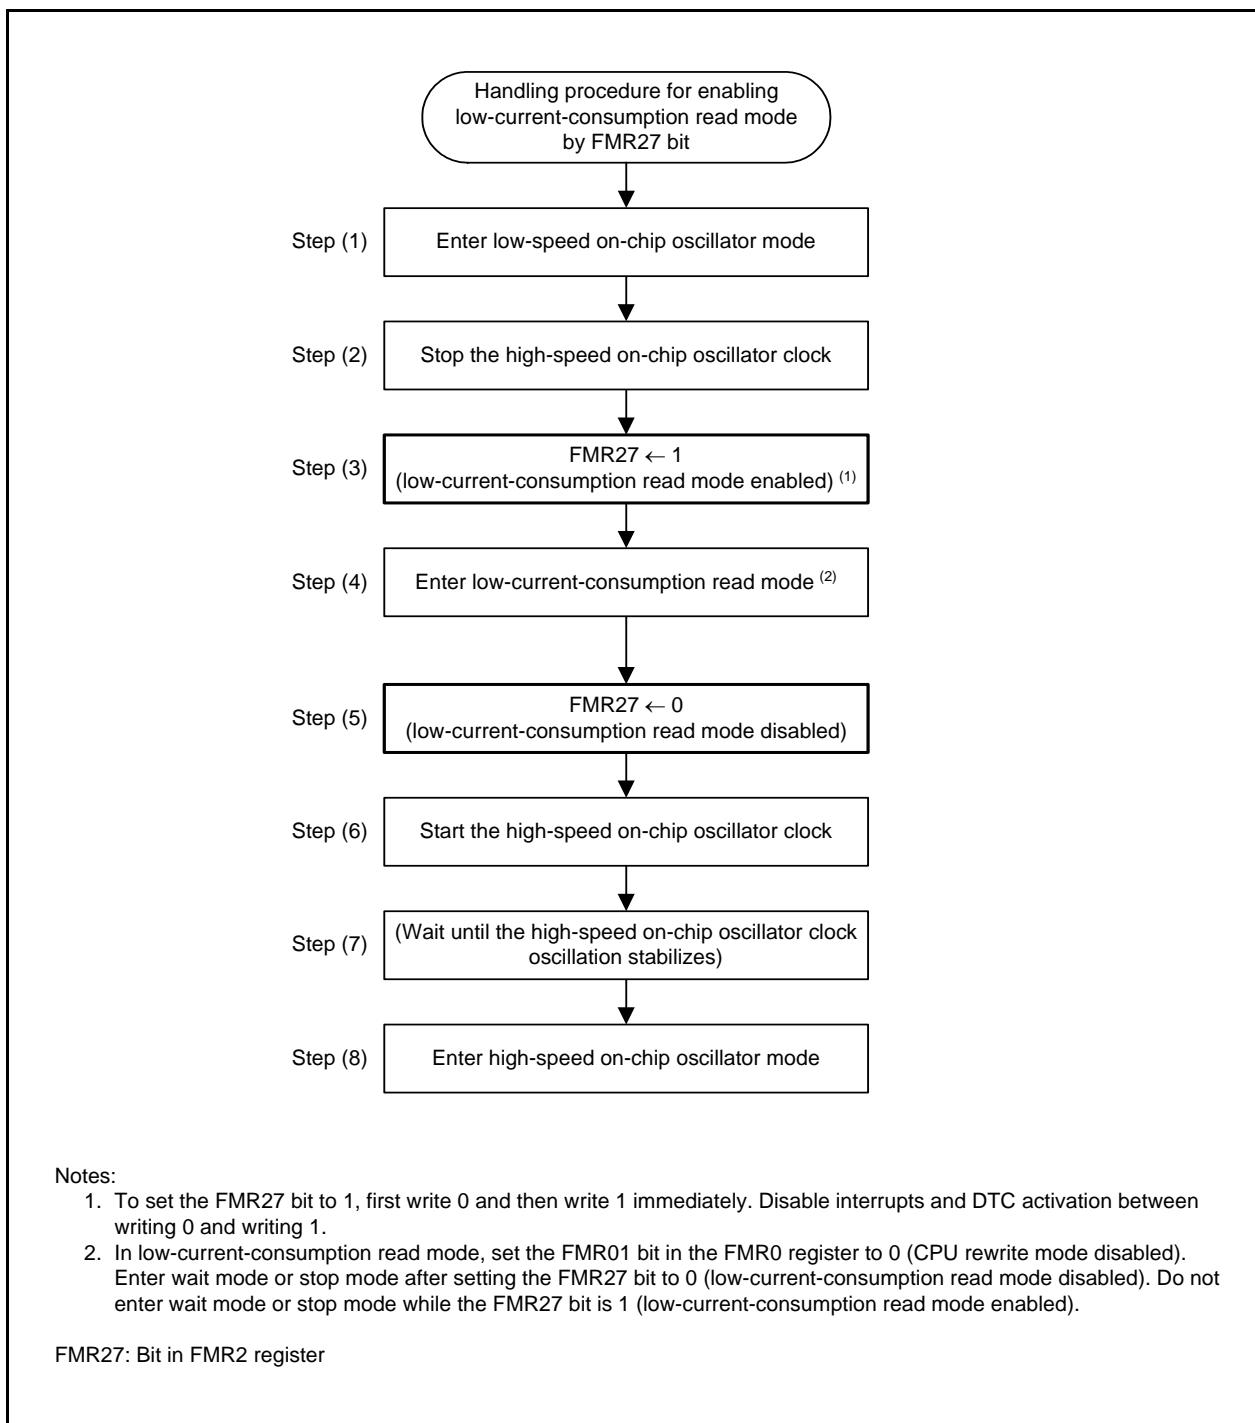

**Figure 26.2 Handling Procedure Example for Reducing Power Consumption Using FMSTP Bit**

### 26.2.10 Low-Current-Consumption Read Mode

In low-speed on-chip oscillator mode, the current consumption when reading the flash memory can be reduced by setting the FMR27 bit in the FMR2 register to 1 (low-current-consumption read mode enabled).

When the CPU clock is set to the low-speed on-chip oscillator clock divided by 4, 8, or 16, low-consumption-current read mode can be used. When divided by 1 (no division) or divided by 2 is set, do not use low-consumption-current read mode. After setting the divide ratio of the CPU clock, set the FMR27 bit to 1 (low-current-consumption read mode enabled).

Enter wait mode or stop mode after setting the FMR27 bit to 0 (low-current-consumption read mode disabled). Do not enter wait mode or stop mode while the FMR27 bit is 1 (low-current-consumption read mode enabled). Figure 26.3 shows the Handling Procedure Example of Low-Current-Consumption Read Mode.

**Figure 26.3 Handling Procedure Example of Low-Current-Consumption Read Mode**

### 26.2.11 Others

Set the MSTTRD bit in the MSTCR register to 1.

The power consumption of the peripheral functions can be reduced.

## 27. Electrical Characteristics

**Table 27.1 Absolute Maximum Ratings**

Symbol	Parameter	Condition	Rated Value	Unit
V <sub>CC</sub> /AV <sub>CC</sub>	Supply voltage		–0.3 to 6.5	V
V <sub>I</sub>	Input voltage		–0.3 to V <sub>CC</sub> + 0.3	V

—	Interval from erase start/restart until following suspend request		0	—	—	μs
—	Time from suspend until erase restart		—	—	30 + CPU clock × 1 cycle	μs
t <sub>d</sub> (CMDRST-READY)	Time from when command is forcibly terminated until reading is enabled		—	—	30 + CPU clock × 1 cycle	μs
—	Program, erase voltage		2.7	—	5.5	V
—	Read voltage		1.8	—	5.5	V
—	Program, erase temperature		0	—	60	°C
—	Data hold time <sup>(7)</sup>	Ambient temperature = 55°C	20	—	—	year

**Notes:**

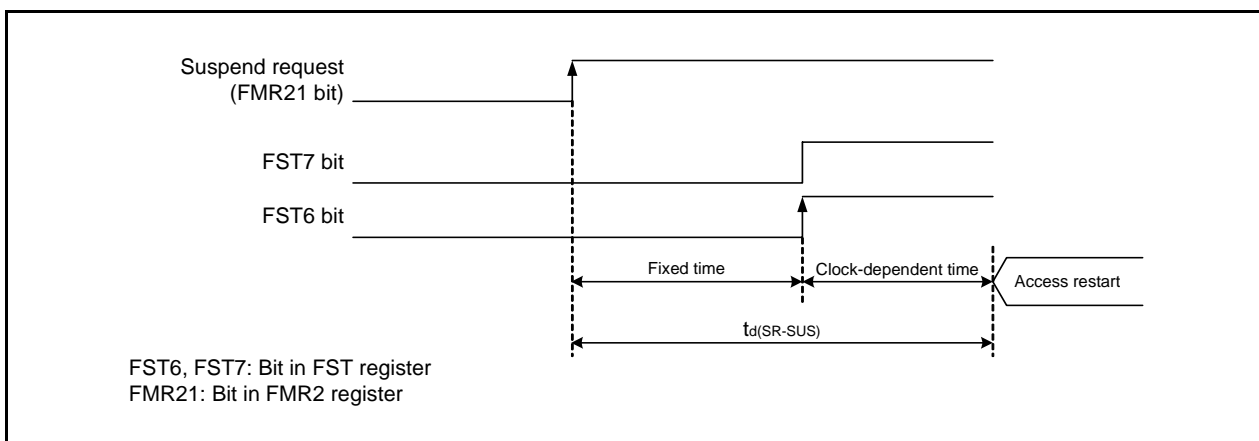

1. V<sub>CC</sub> = 2.7 V to 5.5 V at T<sub>opr</sub> = 0°C to 60°C, unless otherwise specified.
2. Definition of programming/erasure endurance  
The programming and erasure endurance is defined on a per-block basis.  
If the programming and erasure endurance is n (n = 1,000), each block can be erased n times. For example, if 1,024 1-byte writes are performed to different addresses in block A, a 1 Kbyte block, and then the block is erased, the programming/erasure endurance still stands at one.  
However, the same address must not be programmed more than once per erase operation (overwriting prohibited).
3. Endurance to guarantee all electrical characteristics after program and erase. (1 to Min. value can be guaranteed).
4. In a system that executes multiple programming operations, the actual erasure count can be reduced by writing to sequential addresses in turn so that as much of the block as possible is used up before performing an erase operation. For example, when programming groups of 16 bytes, the effective number of rewrites can be minimized by programming up to 128 groups before erasing them all in one operation. It is also advisable to retain data on the erasure endurance of each block and limit the number of erase operations to a certain number.
5. If an error occurs during block erase, attempt to execute the clear status register command, then execute the block erase command at least three times until the erase error does not occur.
6. Customers desiring program/erase failure rate information should contact their Renesas technical support representative.
7. The data hold time includes time that the power supply is off or the clock is not supplied.

**Table 27.5 Flash Memory (Data flash Block A to Block D) Electrical Characteristics**

Symbol	Parameter	Conditions	Standard			Unit
			Min.	Typ.	Max.	
—	Program/erase endurance <sup>(2)</sup>		10,000 <sup>(3)</sup>	—	—	times
—	Byte program time (program/erase endurance ≤ 1,000 times)		—	160	1,500	μs
—	Byte program time (program/erase endurance > 1,000 times)		—	300	1,500	μs
—	Block erase time (program/erase endurance ≤ 1,000 times)		—	0.2	1	s
—	Block erase time (program/erase endurance > 1,000 times)		—	0.3	1	s
t <sub>d</sub> (SR-SUS)	Time delay from suspend request until suspend		—	—	5 + CPU clock × 3 cycles	ms
—	Interval from erase start/restart until following suspend request		0	—	—	μs
—	Time from suspend until erase restart		—	—	30 + CPU clock × 1 cycle	μs
t <sub>d</sub> (CMDRST-READY)	Time from when command is forcibly terminated until reading is enabled		—	—	30 + CPU clock × 1 cycle	μs
—	Program, erase voltage		2.7	—	5.5	V
—	Read voltage		1.8	—	5.5	V
—	Program, erase temperature		-20 <sup>(7)</sup>	—	85	°C
—	Data hold time <sup>(8)</sup>	Ambient temperature = 55°C	20	—	—	year

## Notes:

1. V<sub>CC</sub> = 2.7 V to 5.5 V at T<sub>opr</sub> = -20°C to 85°C (N version)/-40°C to 85°C (D version), unless otherwise specified.
2. Definition of programming/erasure endurance  
The programming and erasure endurance is defined on a per-block basis.  
If the programming and erasure endurance is n (n = 10,000), each block can be erased n times. For example, if 1,024 1-byte writes are performed to different addresses in block A, a 1 Kbyte block, and then the block is erased, the programming/erasure endurance still stands at one.  
However, the same address must not be programmed more than once per erase operation (overwriting prohibited).
3. Endurance to guarantee all electrical characteristics after program and erase. (1 to Min. value can be guaranteed).
4. In a system that executes multiple programming operations, the actual erasure count can be reduced by writing to sequential addresses in turn so that as much of the block as possible is used up before performing an erase operation. For example, when programming groups of 16 bytes, the effective number of rewrites can be minimized by programming up to 128 groups before erasing them all in one operation. In addition, averaging the erasure endurance between blocks A to D can further reduce the actual erasure endurance. It is also advisable to retain data on the erasure endurance of each block and limit the number of erase operations to a certain number.
5. If an error occurs during block erase, attempt to execute the clear status register command, then execute the block erase command at least three times until the erase error does not occur.
6. Customers desiring program/erase failure rate information should contact their Renesas technical support representative.
7. -40°C for D version.
8. The data hold time includes time that the power supply is off or the clock is not supplied.

**Figure 27.2 Time delay until Suspend**

**Table 27.6 Voltage Detection 0 Circuit Electrical Characteristics**

Symbol	Parameter	Condition	Standard			Unit
			Min.	Typ.	Max.	
Vdet0	Voltage detection level Vdet0_0 (2)		1.80	1.90	2.05	V
	Voltage detection level Vdet0_1 (2)		2.15	2.35	2.50	V
	Voltage detection level Vdet0_2 (2)		2.70	2.85	3.05	V

—	Hysteresis width at the rising of Vcc in voltage detection 1 circuit	Vdet1_0 to Vdet1_5 selected	—	0.07	—	V
		Vdet1_6 to Vdet1_F selected	—	0.10	—	V
—	Voltage detection 1 circuit response time (3)	At the falling of Vcc from 5 V to (Vdet1_0 – 0.1) V	—	60	150	μs
—	Voltage detection circuit self power consumption	VCA26 = 1, Vcc = 5.0 V	—	1.7	—	μA
td(E-A)	Waiting time until voltage detection circuit operation starts (4)		—	—	100	μs

Notes:

1. The measurement condition is Vcc = 1.8 V to 5.5 V and Topr = –20°C to 85°C (N version)/–40°C to 85°C (D version).
2. Select the voltage detection level with bits VD1S0 to VD1S3 in the VD1LS register.
3. Time until the voltage monitor 1 interrupt request is generated after the voltage passes Vdet1.
4. Necessary time until the voltage detection circuit operates when setting to 1 again after setting the VCA26 bit in the VCA2 register to 0.

**Table 27.8 Voltage Detection 2 Circuit Electrical Characteristics**

Symbol	Parameter	Condition	Standard			Unit
			Min.	Typ.	Max.	
V <sub>det2</sub>	Voltage detection level V <sub>det2_0</sub>	At the falling of V <sub>cc</sub>	3.70	4.00	4.30	V
—	Hysteresis width at the rising of V <sub>cc</sub> in voltage detection 2 circuit		—	0.10	—	V
—	Voltage detection 2 circuit response time <sup>(2)</sup>	At the falling of V <sub>cc</sub> from 5 V to (V <sub>det2_0</sub> – 0.1) V	—	20	150	μs
—	Voltage detection circuit self power consumption	VCA27 = 1, V <sub>cc</sub> = 5.0 V	—	1.7	—	μA
t <sub>d(E-A)</sub>	Waiting time until voltage detection circuit operation starts <sup>(3)</sup>		—	—	100	μs

Notes:

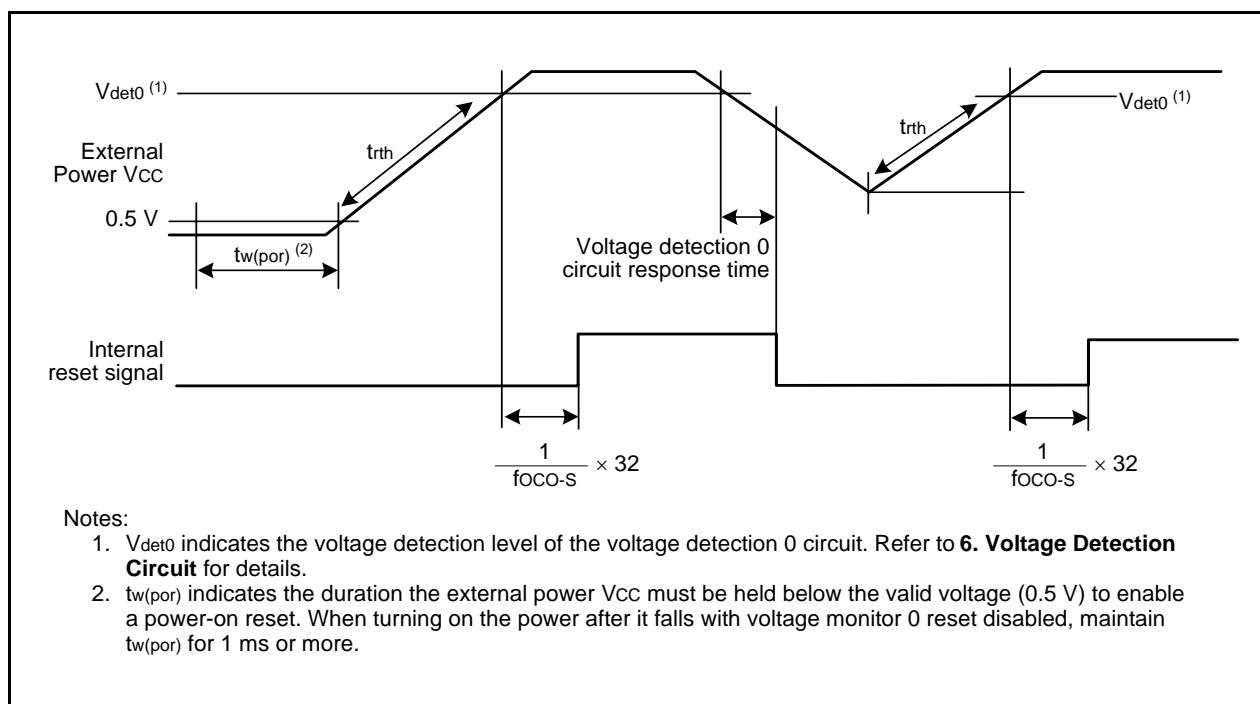

1. The measurement condition is V<sub>cc</sub> = 1.8 V to 5.5 V and T<sub>opr</sub> = –20°C to 85°C (N version)/–40°C to 85°C (D version).
2. Time until the voltage monitor 2 interrupt request is generated after the voltage passes V<sub>det2</sub>.
3. Necessary time until the voltage detection circuit operates after setting to 1 again after setting the VCA27 bit in the VCA2 register to 0.

**Table 27.9 Power-on Reset Circuit <sup>(2)</sup>**

Symbol	Parameter	Condition	Standard			Unit
			Min.	Typ.	Max.	
t <sub>rth</sub>	External power V <sub>cc</sub> rise gradient	(Note 1)	0	—	50000	mV/msec

Notes:

1. The measurement condition is T<sub>opr</sub> = –20°C to 85°C (N version)/–40°C to 85°C (D version), unless otherwise specified.
2. To use the power-on reset function, enable voltage monitor 0 reset by setting the LVDAS bit in the OFS register to 0.

**Figure 27.3 Power-on Reset Circuit Electrical Characteristics**

**Table 27.10 High-speed On-Chip Oscillator Circuit Electrical Characteristics**

Symbol	Parameter	Condition	Standard			Unit
			Min.	Typ.	Max.	
—	High-speed on-chip oscillator frequency after reset	$V_{CC} = 1.8 \text{ V to } 5.5 \text{ V}$ $-20^{\circ}\text{C} \leq T_{opr} \leq 85^{\circ}\text{C}$	38.4	40	41.6	MHz
		$V_{CC} = 1.8 \text{ V to } 5.5 \text{ V}$ $-40^{\circ}\text{C} \leq T_{opr} \leq 85^{\circ}\text{C}$	38.0	40	42.0	MHz
	High-speed on-chip oscillator frequency when the FRA4 register correction value is written into the FRA1 register and the FRA5 register correction value into the FRA3 register <sup>(2)</sup>	$V_{CC} = 1.8 \text{ V to } 5.5 \text{ V}$ $-20^{\circ}\text{C} \leq T_{opr} \leq 85^{\circ}\text{C}$	35.389	36.864	38.338	MHz
		$V_{CC} = 1.8 \text{ V to } 5.5 \text{ V}$ $-40^{\circ}\text{C} \leq T_{opr} \leq 85^{\circ}\text{C}$	35.020	36.864	38.707	MHz
	High-speed on-chip oscillator frequency when the FRA6 register correction value is written into the FRA1 register and the FRA7 register correction value into the FRA3 register	$V_{CC} = 1.8 \text{ V to } 5.5 \text{ V}$ $-20^{\circ}\text{C} \leq T_{opr} \leq 85^{\circ}\text{C}$	30.72	32	33.28	MHz
		$V_{CC} = 1.8 \text{ V to } 5.5 \text{ V}$ $-40^{\circ}\text{C} \leq T_{opr} \leq 85^{\circ}\text{C}$	30.40	32	33.60	MHz
—	Oscillation stability time	$V_{CC} = 5.0 \text{ V}$ , $T_{opr} = 25^{\circ}\text{C}$	—	0.5	3	ms
—	Self power consumption at oscillation	$V_{CC} = 5.0 \text{ V}$ , $T_{opr} = 25^{\circ}\text{C}$	—	400	—	$\mu\text{A}$

Notes:

1.  $V_{CC} = 1.8 \text{ V to } 5.5 \text{ V}$ ,  $T_{opr} = -20^{\circ}\text{C to } 85^{\circ}\text{C}$  (N version)/ $-40^{\circ}\text{C to } 85^{\circ}\text{C}$  (D version), unless otherwise specified.
2. This enables the setting errors of bit rates such as 9600 bps and 38400 bps to be 0% when the serial interface is used in UART mode.

**Table 27.11 Low-speed On-Chip Oscillator Circuit Electrical Characteristics**

Symbol	Parameter	Condition	Standard			Unit
			Min.	Typ.	Max.	
fOCO-S	Low-speed on-chip oscillator frequency		60	125	250	kHz
—	Oscillation stability time	$V_{CC} = 5.0 \text{ V}$ , $T_{opr} = 25^{\circ}\text{C}$	—	30	100	$\mu\text{s}$
—	Self power consumption at oscillation	$V_{CC} = 5.0 \text{ V}$ , $T_{opr} = 25^{\circ}\text{C}$	—	2	—	$\mu\text{A}$

Note:

1.  $V_{CC} = 1.8 \text{ V to } 5.5 \text{ V}$ ,  $T_{opr} = -20^{\circ}\text{C to } 85^{\circ}\text{C}$  (N version)/ $-40^{\circ}\text{C to } 85^{\circ}\text{C}$  (D version), unless otherwise specified.

**Table 27.12 Power Supply Circuit Timing Characteristics**

Symbol	Parameter	Condition	Standard			Unit
			Min.	Typ.	Max.	
$t_{d(P-R)}$	Time for internal power supply stabilization during power-on <sup>(2)</sup>		—	—	2000	$\mu\text{s}$

Notes:

1. The measurement condition is  $V_{CC} = 1.8 \text{ V to } 5.5 \text{ V}$  and  $T_{opr} = 25^{\circ}\text{C}$ .
2. Waiting time until the internal power supply generation circuit stabilizes during power-on.

## 28. Usage Notes

### 28.1 Notes on Clock Generation Circuit

#### 28.1.1 Stop Mode

To enter stop mode, set the FMR01 bit in the FMR0 register to 0 (CPU rewrite mode disabled) and then the CM10 bit in the CM1 register to 1 (stop mode). An instruction queue pre-reads 4 bytes from the instruction which sets the CM10 bit to 1 (stop mode) and the program stops.

Insert at least four NOP instructions following the JMP.B instruction after the instruction which sets the CM10 bit to 1.

- Program example to enter stop mode

```

BCLR      1, FMR0      ; CPU rewrite mode disabled
BCLR      7, FMR2      ; Low-current-consumption read mode disabled
BSET      0, PRCLR     ; Writing to CM1 register enabled
FSET      I            ; Enable interrupt
BSET      0, CM1       ; Stop mode
JMP.B     LABEL_001
LABEL_001:
NOP
NOP
NOP
NOP

```

#### 28.1.2 Wait Mode

To enter wait mode by setting the CM30 bit to 1, set the FMR01 bit in the FMR0 register to 0 (CPU rewrite mode disabled) before setting the CM30 bit to 1.

To enter wait mode with the WAIT instruction, set the FMR01 bit in the FMR0 register to 0 (CPU rewrite mode disabled) and then execute the WAIT instruction. An instruction queue pre-reads 4 bytes from the instruction to set the CM30 bit to 1 (MCU enters wait mode) or the WAIT instruction, and then the program stops. Insert at least four NOP instructions after the instruction to set the CM30 bit to 1 (MCU enters wait mode) or the WAIT instruction.

- Program example to execute the WAIT instruction

```

BCLR      1, FMR0      ; CPU rewrite mode disabled
BCLR      7, FMR2      ; Low-current-consumption read mode disabled
FSET      I            ; Enable interrupt
WAIT      ; Wait mode
NOP
NOP
NOP
NOP

```

- Program example to execute the instruction to set the CM30 bit to 1

```

BCLR      1, FMR0      ; CPU rewrite mode disabled
BCLR      7, FMR2      ; Low-current-consumption read mode disabled
BSET      0, PRCLR     ; Writing to CM3 register enabled
FCLR      I            ; Interrupt disabled
BSET      0, CM3       ; Wait mode
NOP
NOP
NOP
NOP
BCLR      0, PRCLR     ; Writing to CM3 register disabled
FSET      I            ; Interrupt enabled

```

### 28.1.3 Oscillation Stop Detection Function

Since the oscillation stop detection function cannot be used if the XIN clock frequency is below 2 MHz, set bits OCD1 to OCD0 to 00b.

### 28.1.4 Oscillation Circuit Constants

Consult the oscillator manufacturer to determine the optimal oscillation circuit constants for the user system. To use the MCU with supply voltage below  $VCC = 2.7\text{ V}$ , it is recommended to set the CM11 bit in the CM1 register to 1 (on-chip feedback resistor disabled) and connect the feedback resistor to the chip externally.

## 28.2 Notes on Interrupts

### 28.2.1 Reading Address 00000h

Do not read address 00000h by a program. When a maskable interrupt request is acknowledged, the CPU reads interrupt information (interrupt number and interrupt request level) from 00000h in the interrupt sequence. At this time, the IR bit for the acknowledged interrupt is set to 0.

If address 00000h is read by a program, the IR bit for the interrupt which has the highest priority among the enabled interrupts is set to 0. This may cause the interrupt to be canceled, or an unexpected interrupt to be generated.

### 28.2.2 SP Setting

Set a value in the SP before an interrupt is acknowledged. The SP is set to 0000h after a reset. If an interrupt is acknowledged before setting a value in the SP, the program may run out of control.

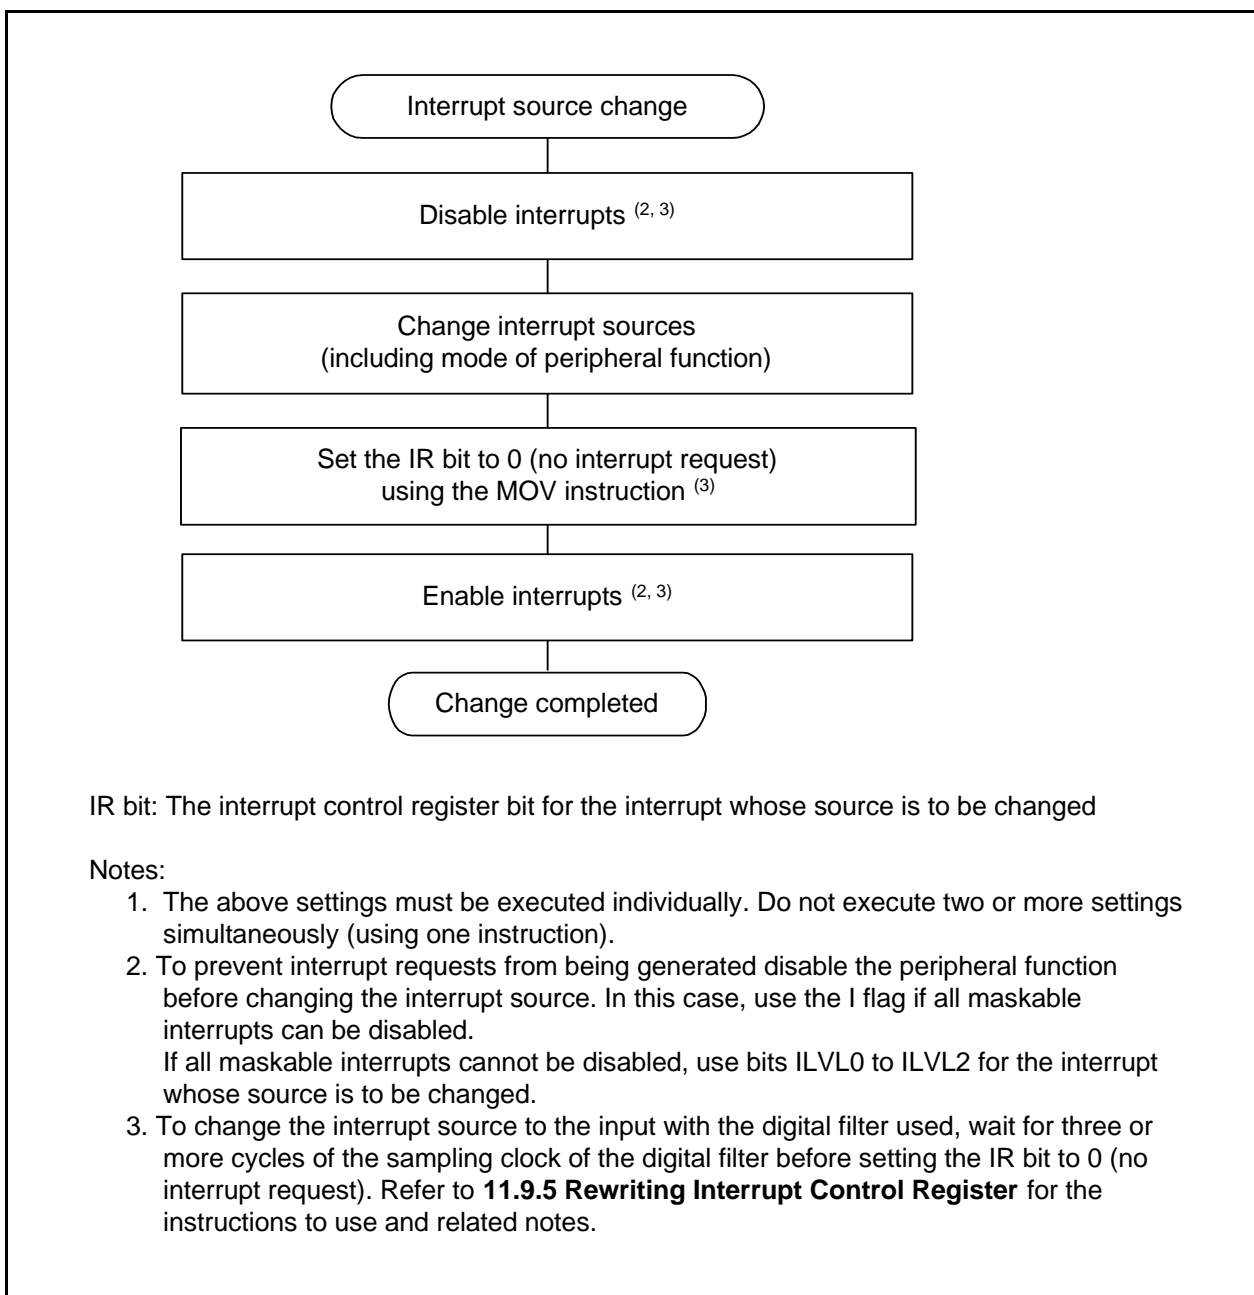

### 28.2.3 External Interrupt and Key Input Interrupt

Either the “L” level width or “H” level width shown in the Electrical Characteristics is required for the signal input to pins  $\overline{\text{INT0}}$  to  $\overline{\text{INT3}}$  and pins  $\overline{\text{KI0}}$  to  $\overline{\text{KI3}}$ , regardless of the CPU clock.

For details, refer to **Table 27.18** (VCC = 5 V), **Table 27.24** (VCC = 3 V), **Table 27.30** (VCC = 2.2 V) **External Interrupt INTi (i = 0 to 3) Input, Key Input Interrupt KIi (i = 0 to 3).**

### 28.2.4 Changing Interrupt Sources

The IR bit in the interrupt control register may be set to 1 (interrupt requested) when the interrupt source changes. To use an interrupt, set the IR bit to 0 (no interrupt requested) after changing interrupt sources. Changing interrupt sources as referred to here includes all factors that change the source, polarity, or timing of the interrupt assigned to a software interrupt number. Therefore, if a mode change of a peripheral function involves the source, polarity, or timing of an interrupt, set the IR bit to 0 (no interrupt requested) after making these changes. Refer to the descriptions of the individual peripheral functions for related interrupts. Figure 28.1 shows a Procedure Example for Changing Interrupt Sources.

**Figure 28.1 Procedure Example for Changing Interrupt Sources**

### 28.2.5 Rewriting Interrupt Control Register

- (a) The contents of the interrupt control register can be rewritten only while no interrupt requests corresponding to that register are generated. If an interrupt request may be generated, disable the interrupt before rewriting the contents of the interrupt control register.
- (b) When rewriting the contents of the interrupt control register after disabling the interrupt, be careful to choose appropriate instructions.

#### Changing any bit other than the IR bit

If an interrupt request corresponding to the register is generated while executing the instruction, the IR bit may not be set to 1 (interrupt requested), and the interrupt may be ignored. If this causes a problem, use one of the following instructions to rewrite the contents of the register: AND, OR, BCLR, and BSET.

#### Changing the IR bit

Depending on the instruction used, the IR bit may not be set to 0 (no interrupt requested).  
Use the MOV instruction to set the IR bit to 0.

- (c) When using the I flag to disable an interrupt, set the I flag as shown in the sample programs below. Refer to (b) regarding rewriting the contents of interrupt control registers using the sample programs.

Examples 1 to 3 shows how to prevent the I flag from being set to 1 (interrupts enabled) before the contents of the interrupt control register are rewritten for the effects of the internal bus and the instruction queue buffer.

#### Example 1: Use the NOP instructions to pause program until the interrupt control register is rewritten

```
INT_SWITCH1:
    FCLR    I                ; Disable interrupts
    AND.B   #00H, 0056H     ; Set the TRAIC register to 00h
    NOP
    NOP
    FSET    I                ; Enable interrupts
```

#### Example 2: Use a dummy read to delay the FSET instruction

```
INT_SWITCH2:
    FCLR    I                ; Disable interrupts
    AND.B   #00H, 0056H     ; Set the TRAIC register to 00h
    MOV.W   MEM,R0          ; Dummy read
    FSET    I                ; Enable interrupts
```

#### Example 3: Use the POPC instruction to change the I flag

```
INT_SWITCH3:
    PUSHC   FLG
    FCLR    I                ; Disable interrupts
    AND.B   #00H, 0056H     ; Set the TRAIC register to 00h
    POPC    FLG             ; Enable interrupts
```

## 28.3 Notes on ID Code Areas

### 28.3.1 Setting Example of ID Code Areas

The ID code areas are allocated in the flash memory, not in the SFRs. Set appropriate values as ROM data by a program. The following shows a setting example.

- To set 55h in all of the ID code areas

```
.org 00FFDCH
.lword dummy | (55000000h) ; UND
.lword dummy | (55000000h) ; INTO
.lword dummy; BREAK
.lword dummy | (55000000h) ; ADDRESS MATCH
.lword dummy | (55000000h) ; SET SINGLE STEP
.lword dummy | (55000000h) ; WDT
.lword dummy | (55000000h) ; ADDRESS BREAK
.lword dummy | (55000000h) ; RESERVE
```

(Programming formats vary depending on the compiler. Check the compiler manual.)

## 28.4 Notes on Option Function Select Area

### 28.4.1 Setting Example of Option Function Select Area

The option function select area is allocated in the flash memory, not in the SFRs. Set appropriate values as ROM data by a program. The following shows a setting example.

- To set FFh in the OFS register

```
.org 00FFFCH
.lword reset | (0FF000000h) ; RESET
```

(Programming formats vary depending on the compiler. Check the compiler manual.)

- To set FFh in the OFS2 register

```
.org 00FFDBH
.byte 0FFh
```

(Programming formats vary depending on the compiler. Check the compiler manual.)

## 28.5 Notes on DTC

### 28.5.1 DTC activation source

- Do not generate any DTC activation sources before entering wait mode or during wait mode.
- Do not generate any DTC activation sources before entering stop mode or during stop mode.

### 28.5.2 DTCENi (i = 0 to 3, 5, 6) Registers

- Modify bits DTCENi0 to DTCENi7 only while an interrupt request corresponding to the bit is not generated.
- When the interrupt source flag in the status register for the peripheral function is 1, do not modify the corresponding activation source bit among bits DTCENi0 to DTCENi7.
- Do not access the DTCENi registers using DTC transfers.

### 28.5.3 Peripheral Modules

Do not set the status register bit for the peripheral function to 0 using a DTC transfer.

### 28.5.4 Interrupt Request

No interrupt is generated for the CPU during DTC operation in any of the following cases:

- When the DTC activation source is flash ready status
- When performing the data transfer causing the DTCCTj (j = 0 to 23) register value to change to 0 in normal mode
- When performing the data transfer causing the DTCCRj register value to change to 0 while the RPTINT bit in the DTCCRj register is 1 (interrupt generation enabled) in repeat mode

## 28.6 Notes on Timer RA

- Timer RA stops counting after a reset. Set the values in the timer RA and timer RA prescalers before the count starts.
- Even if the prescaler and timer RA are read out in 16-bit units, these registers are read 1 byte at a time by the MCU. Consequently, the timer value may be updated during the period when these two registers are being read.
- In pulse width measurement mode and pulse period measurement mode, bits TEDGF and TUNDF in the TRACR register can be set to 0 by writing 0 to these bits by a program. However, these bits remain unchanged if 1 is written. When using the READ-MODIFY-WRITE instruction for the TRACR register, the TEDGF or TUNDF bit may be set to 0 although these bits are set to 1 while the instruction is being executed. In this case, write 1 to the TEDGF or TUNDF bit which is not supposed to be set to 0 with the MOV instruction.
- When changing to pulse period measurement mode from another mode, the contents of bits TEDGF and TUNDF are undefined. Write 0 to bits TEDGF and TUNDF before the count starts.
- The TEDGF bit may be set to 1 by the first timer RA prescaler underflow generated after the count starts.
- When using the pulse period measurement mode, leave two or more periods of the timer RA prescaler immediately after the count starts, then set the TEDGF bit to 0.
- The TCSTF bit retains 0 (count stops) for 0 to 1 cycle of the count source after setting the TSTART bit to 1 (count starts) while the count is stopped.

During this time, do not access registers associated with timer RA <sup>(1)</sup> other than the TCSTF bit. Timer RA starts counting at the first valid edge of the count source after the TCSTF bit is set to 1 (during count).

The TCSTF bit remains 1 for 0 to 1 cycle of the count source after setting the TSTART bit to 0 (count stops) while the count is in progress. Timer RA counting is stopped when the TCSTF bit is set to 0.

During this time, do not access registers associated with timer RA <sup>(1)</sup> other than the TCSTF bit.

Note:

1. Registers associated with timer RA: TRACR, TRAIOC, TRAMR, TRAPRE, and TRA.

- When the TRAPRE register is continuously written during count operation (TCSTF bit is set to 1), allow three or more cycles of the count source clock for each write interval.
- When the TRA register is continuously written during count operation (TCSTF bit is set to 1), allow three or more cycles of the prescaler underflow for each write interval.

## 28.7 Notes on Timer RB

- Timer RB stops counting after a reset. Set the values in the timer RB and timer RB prescalers before the count starts.
- Even if the prescaler and timer RB is read out in 16-bit units, these registers are read 1 byte at a time by the MCU. Consequently, the timer value may be updated during the period when these two registers are being read.
- In programmable one-shot generation mode and programmable wait one-shot generation mode, when setting the TSTART bit in the TRBCR register to 0 (stops counting) or setting the TOSSP bit in the TRBOCR register to 1 (stops one-shot), the timer reloads the value of reload register and stops. Therefore, in programmable one-shot generation mode and programmable wait one-shot generation mode, read the timer count value before the timer stops.
- The TCSTF bit remains 0 (count stops) for 1 to 2 cycles of the count source after setting the TSTART bit to 1 (count starts) while the count is stopped.

During this time, do not access registers associated with timer RB <sup>(1)</sup> other than the TCSTF bit. Timer RB starts counting at the first valid edge of the count source after the TCSTF bit is set to 1 (during count).

The TCSTF bit remains 1 for 1 to 2 cycles of the count source after setting the TSTART bit to 0 (count stops) while the count is in progress. Timer RB counting is stopped when the TCSTF bit is set to 0.

During this time, do not access registers associated with timer RB <sup>(1)</sup> other than the TCSTF bit.

Note:

1. Registers associated with timer RB: TRBCR, TRBOCR, TRBIOC, TRBMR, TRBPRES, TRBSC, and TRBPR.

- If the TSTOP bit in the TRBCR register is set to 1 during timer operation, timer RB stops immediately.
- If 1 is written to the TOSST or TOSSP bit in the TRBOCR register, the value of the TOSSTF bit changes after one or two cycles of the count source have elapsed. If the TOSSP bit is written to 1 during the period between when the TOSST bit is written to 1 and when the TOSSTF bit is set to 1, the TOSSTF bit may be set to either 0 or 1 depending on the content state. Likewise, if the TOSST bit is written to 1 during the period between when the TOSSP bit is written to 1 and when the TOSSTF bit is set to 0, the TOSSTF bit may be set to either 0 or 1.
- To use the underflow signal of timer RA as the count source for timer RB, set timer RA in timer mode, pulse output mode, or event count mode.

### 28.7.1 Timer Mode

To write to registers TRBPRES and TRBPR during count operation (TCSTF bit in the TRBCR register is set to 1), note the following points:

- When the TRBPRES register is written continuously, allow three or more cycles of the count source for each write interval.
- When the TRBPR register is written continuously, allow three or more cycles of the prescaler underflow for each write interval.

### 28.7.2 Programmable Waveform Generation Mode

To write to registers TRBPRES and TRBPR during count operation (TCSTF bit in the TRBCR register is set to 1), note the following points:

- When the TRBPRES register is written continuously, allow three or more cycles of the count source for each write interval.
- When the TRBPR register is written continuously, allow three or more cycles of the prescaler underflow for each write interval.

### 28.7.3 Programmable One-shot Generation Mode

To write to registers TRBPRES and TRBPR during count operation (TCSTF bit in the TRBCR register is set to 1), note the following points:

- When the TRBPRES register is written continuously during count operation (TCSTF bit is set to 1), allow three or more cycles of the count source for each write interval.
- When the TRBPR register is written continuously during count operation (TCSTF bit is set to 1), allow three or more cycles of the prescaler underflow for each write interval.

### 28.7.4 Programmable Wait One-shot Generation Mode

To write to registers TRBPRES and TRBPR during count operation (TCSTF bit in the TRBCR register is set to 1), note the following points:

- When the TRBPRES register is written continuously, allow three or more cycles of the count source for each write interval.
- When the TRBPR register is written continuously, allow three or more cycles of the prescaler underflow for each write interval.

## 28.8 Notes on Timer RC

### 28.8.1 TRC Register

- The following note applies when the CCLR bit in the TRCCR1 register is set to 1 (clear TRC register at compare match with TRCGRA register).

When using a program to write a value to the TRC register while the TSTART bit in the TRCMR register is set to 1 (count starts), ensure that the write does not overlap with the timing with which the TRC register is set to 0000h.

If the timing of the write to the TRC register and the setting of the TRC register to 0000h coincide, the write value will not be written to the TRC register and the TRC register will be set to 0000h.

- Reading from the TRC register immediately after writing to it can result in the value previous to the write being read out. To prevent this, execute the JMP.B instruction between the read and the write instructions.

Program Example	MOV.W	#XXXXh, TRC	; Write
	JMP.B	L1	; JMP.B instruction
L1:	MOV.W	TRC, DATA	; Read

### 28.8.2 TRCSR Register

Reading from the TRCSR register immediately after writing to it can result in the value previous to the write being read out. To prevent this, execute the JMP.B instruction between the read and the write instructions.

Program Example	MOV.B	#XXh, TRCSR	; Write
	JMP.B	L1	; JMP.B instruction
L1:	MOV.B	TRCSR, DATA	; Read

### 28.8.3 TRCCR1 Register

To set bits TCK2 to TCK0 in the TRCCR1 register to 111b (fOCO-F), set fOCO-F to the clock frequency higher than the CPU clock frequency.

### 28.8.4 Count Source Switching

- Stop the count before switching the count source.

Switching procedure

- (1) Set the TSTART bit in the TRCMR register to 0 (count stops).
- (2) Change the settings of bits TCK2 to TCK0 in the TRCCR1 register.

- After switching the count source from fOCO40M to another clock, allow a minimum of two cycles of f1 to elapse after changing the clock setting before stopping fOCO40M.

Switching procedure

- (1) Set the TSTART bit in the TRCMR register to 0 (count stops).
- (2) Change the settings of bits TCK2 to TCK0 in the TRCCR1 register.
- (3) Wait for a minimum of two cycles of f1.
- (4) Set the FRA00 bit in the FRA0 register to 0 (high-speed on-chip oscillator off).

- After switching the count source from fOCO-F to fOCO40M, allow a minimum of two cycles of fOCO-F to elapse after changing the clock setting before stopping fOCO-F.

Switching procedure

- (1) Set the TSTART bit in the TRCMR register to 0 (count stops).
- (2) Change the settings of bits TCK2 to TCK0 in the TRCCR1 register.
- (3) Wait for a minimum of two cycles of fOCO-F.
- (4) Set the FRA00 bit in the FRA0 register to 0 (high-speed on-chip oscillator off).

- After switching the count source from fOCO-F to a clock other than fOCO40M, allow a minimum of one cycle of fOCO-F + fOCO40M to elapse after changing the clock setting before stopping fOCO-F.

Switching procedure

- (1) Set the TSTART bit in the TRCMR register to 0 (count stops).
- (2) Change the settings of bits TCK2 to TCK0 in the TRCCR1 register.
- (3) Wait for a minimum of one cycle of fOCO-F + fOCO40M.
- (4) Set the FRA00 bit in the FRA0 register to 0 (high-speed on-chip oscillator off).

### 28.8.5 Input Capture Function

- Set the pulse width of the input capture signal as follows:  
 [When the digital filter is not used]  
 Three or more cycles of the timer RC operation clock (refer to **Table 19.1 Timer RC Operation Clock**)  
 [When the digital filter is used]  
 Five cycles of the digital filter sampling clock + three cycles of the timer RC operating clock, minimum (refer to **Figure 19.5 Digital Filter Block Diagram**)
- The value of the TRC register is transferred to the TRCGRj register one or two cycles of the timer RC operation clock after the input capture signal is input to the TRCIOj (j = A, B, C, or D) pin (when the digital filter function is not used).

### 28.8.6 TRCMR Register in PWM2 Mode

When the CSEL bit in the TRCCR2 register is set to 1 (count stops at compare match with the TRCGRA register), do not set the TRCMR register at compare match timing of registers TRC and TRCGRA.

### 28.8.7 Count Source fOCO40M

The count source fOCO40M can be used with supply voltage  $VCC = 2.7\text{ V}$  to  $5.5\text{ V}$ . For supply voltage other than that, do not set bits TCK2 to TCK0 in the TRCCR1 register to 110b (select fOCO40M as the count source).

## 28.9 Notes on Serial Interface (UARTi (i = 0 or 1))

- When reading data from the UiRB (i = 0 or 1) register either in clock synchronous serial I/O mode or in clock asynchronous serial I/O mode, always read data in 16-bit units.

When the high-order byte of the UiRB register is read, bits PER and FER in the UiRB register and the RI bit in the UiC1 register are set to 0.

To check receive errors, read the UiRB register and then use the read data.

Program example to read the receive buffer register:

```
MOV.W    00A6H, R0    ; Read the U0RB register
```

- When writing data to the UiTB register in clock asynchronous serial I/O mode with 9-bit transfer data length, write data to the high-order byte first and then the low-order byte, in 8-bit units.

Program example to write to the transmit buffer register:

```
MOV.B    #XXH, 00A3H  ; Write to the high-order byte of the U0TB register
```

```
MOV.B    #XXH, 00A2H  ; Write to the low-order byte of the U0TB register
```

## 28.10 Notes on Serial Interface (UART2)

### 28.10.1 Clock Synchronous Serial I/O Mode

#### 28.10.1.1 Transmission/Reception

When the  $\overline{\text{RTS}}$  function is used with an external clock, the  $\overline{\text{RTS2}}$  pin outputs “L,” which informs the transmitting side that the MCU is ready for a receive operation. The  $\overline{\text{RTS2}}$  pin outputs “H” when a receive operation starts. Therefore, the transmit timing and receive timing can be synchronized by connecting the  $\overline{\text{RTS2}}$  pin to the  $\overline{\text{CTS2}}$  pin of the transmitting side. The  $\overline{\text{RTS}}$  function is disabled when an internal clock is selected.

#### 28.10.1.2 Transmission

If an external clock is selected, the following conditions must be met while the external clock is held high when the CKPOL bit in the U2C0 register is set to 0 (transmit data output at the falling edge and receive data input at the rising edge of the transfer clock), or while the external clock is held low when the CKPOL bit is set to 1 (transmit data output at the rising edge and receive data input at the falling edge of the transfer clock).

- The TE bit in the U2C1 register = 1 (transmission enabled)
- The TI bit in the U2C1 register = 0 (data present in the U2TB register)
- If the  $\overline{\text{CTS}}$  function is selected, input on the  $\overline{\text{CTS2}}$  pin = “L”

#### 28.10.1.3 Reception

In clock synchronous serial I/O mode, the shift clock is generated by activating the transmitter. Set the UART2-associated registers for transmit operation even if the MCU is used for receive operation only. Dummy data is output from the TXD2 pin while receiving.

When an internal clock is selected, the shift clock is generated by setting the TE bit in the U2C1 register to 1 (transmission enabled) and placing dummy data in the U2TB register. When an external clock is selected, set the TE bit to 1 (transmission enabled), place dummy data in the U2TB register, and input an external clock to the CLK2 pin to generate the shift clock.

If data is received consecutively, an overrun error occurs when the RE bit in the U2C1 register is set to 1 (data present in the U2RB register) and the next receive data is received in the UART2 receive register. Then, the OER bit in the U2RB register is set to 1 (overrun error). At this time, the U2RB register value is undefined. If an overrun error occurs, the IR bit in the S2RIC register remains unchanged.

To receive data consecutively, set dummy data in the low-order byte in the U2TB register per each receive operation.

If an external clock is selected, the following conditions must be met while the external clock is held high when the CKPOL bit is set to 0, or while the external clock is held low when the CKPOL bit is set to 1.

- The RE bit in the U2C1 register = 1 (reception enabled)
- The TE bit in the U2C1 register = 1 (transmission enabled)
- The TI bit in the U2C1 register = 0 (data present in the U2TB register)

### 28.10.2 Special Mode 1 (I<sup>2</sup>C Mode)

When generating start, stop, and restart conditions, set the STSPSEL bit in the U2SMR4 register to 0 and wait for more than half cycle of the transfer clock before changing each condition generation bit (STAREQ, RSTAREQ, and STPREQ) from 0 to 1.

### 28.11 Notes on Hardware LIN

For the time-out processing of the header and response fields, use another timer to measure the duration of time with a Synch Break detection interrupt as the starting point.

### 28.12 Notes on A/D Converter

- Write to the ADMOD register, the ADINSEL register, the ADCON0 register (other than ADST bit), the ADCON1 register, the OCVREFCR register when A/D conversion is stopped (before a trigger occurs).
- To use the A/D converter in repeat mode 0, repeat mode 1, or repeat sweep mode, select the frequency of the A/D converter operating clock  $\phi_{AD}$  or more for the CPU clock during A/D conversion.  
Do not select fOCO-F as  $\phi_{AD}$ .
- Connect 0.1  $\mu$ F capacitor between the VREF pin and AVSS pin.
- Do not enter stop mode during A/D conversion.
- Do not enter wait mode during A/D conversion regardless of the state of the CM02 bit in the CM0 register (1: Peripheral function clock stops in wait mode or 0: Peripheral function clock does not stop in wait mode).
- Do not set the FMSTP bit in the FMR0 register to 1 (flash memory stops) or the FMR27 bit to 1 (low-consumption-current read mode enabled) during A/D conversion. Otherwise, the A/D conversion result will be undefined.
- Do not change the CKS2 bit in the ADMOD register while fOCO-F is stopped.
- During an A/D conversion operation, if the ADST bit in the ADCON0 register is set to 0 (A/D conversion stops) by a program to forcibly terminate A/D conversion, the conversion result of the A/D converter is undefined and no interrupt is generated. The value of the ADi register before A/D conversion may also be undefined.  
If the ADST bit is set to 0 by a program, do not use the value of all the ADi register.

## 28.13 Notes on Sensor Control Unit

### 28.13.1 Address to Store Detection Data

Set the start address in the SCUDAR register.

Also set the same start address in the DTDARj (j = 0 to 23) register of the DTC.

For the DTC settings, refer to **15. DTC**.

### 28.13.2 Wait Mode

- When the sensor control unit is used in wait mode, set wait mode immediately after setting the SCSTRT bit in the SCUCR0 register to 1 (measurement starts).

If the MCU exits wait mode during touch detection, the EWMER bit in the SCUFR register is set to 1. The detection data at that time is undefined.

- To enter wait mode while the sensor control unit is operating (the SCUE bit in the SCUCR0 register is set to 1), do not use the CM30 bit (wait control bit) in the CM3 register. Use the WAIT instruction.
- When the sensor control unit is used in wait mode, set the WTFMACT bit in the FMR1 register to 1 (flash memory operates in wait mode).

### 28.13.3 A/D Converter

Do not use the A/D converter (or do not set the ADST bit in the ADCON0 register to 1) while the sensor control unit is operating.

### 28.13.4 Measurement Trigger

- If a measurement start trigger is generated during forced stop, all counter values change to 0.
- The measurement start trigger is recognized when bits SCCAP1 to SCCAP0 in the SCUMR register are set from 10b (measurement start trigger from timer RC) to 11b (external trigger ( $\overline{\text{SCUTRG}}$ ) while the  $\overline{\text{SCUTRG}}$  pin is held "L" during measurement operation.

### 28.13.5 Charging Time

To prevent measurement data from being overwritten to the next measurement data, the sensor control unit should be kept charged until DTC transfer or internal SDMA transfer is completed.

## 28.14 Notes on Flash Memory

### 28.14.1 CPU Rewrite Mode

#### 28.14.1.1 Prohibited Instructions

The following instructions cannot be used while the program ROM area is being rewritten in EW0 mode because they reference data in the flash memory: UND, INTO, and BRK.

#### 28.14.1.2 Interrupts

Tables 28.1 to 28.3 list CPU Rewrite Mode Interrupts.

**Table 28.1 CPU Rewrite Mode Interrupts (1)**

Mode	Erase/ Write Target	Status	Maskable Interrupt
EW0	Data flash	During auto-erase (suspend enabled)	When an interrupt request is acknowledged, interrupt handling is executed. If the FMR22 bit is set to 1 (erase-suspend request enabled by interrupt request), the FMR21 bit is automatically set to 1 (erase-suspend request). The flash memory suspends auto-erase after td(SR-SUS). If erase-suspend is required while the FMR22 bit is set to 0 (erase-suspend request disabled by interrupt request), set the FMR21 bit to 1 during interrupt handling. The flash memory suspends auto-erase after td(SR-SUS). While auto-erase is being suspended, any block other than the block during auto-erase execution can be read or written. Auto-erase can be restarted by setting the FMR21 bit to 0 (erase restart).
		During auto-erase (suspend disabled or FMR22 = 0)	Interrupt handling is executed while auto-erase or auto-programming is being performed.
		During auto-programming	
	Program ROM	During auto-erase (suspend enabled)	Usable by allocating a vector in RAM.
		During auto-erase (suspend disabled)	
		During auto-programming	
EW1	Data flash	During auto-erase (suspend enabled)	When an interrupt request is acknowledged, interrupt handling is executed. If the FMR22 bit is set to 1, the FMR21 bit is automatically set to 1. The flash memory suspends auto-erase after td(SR-SUS). If erase-suspend is required while the FMR22 bit is set to 0, set the FMR21 bit to 1 during interrupt handling. The flash memory suspends auto-erase after td(SR-SUS). While auto-erase is being suspended, any block other than the block during auto-erase execution can be read or written. Auto-erase can be restarted by setting the FMR21 bit to 0.
		During auto-erase (suspend disabled or FMR22 = 0)	Interrupt handling is executed while auto-erase or auto-programming is being performed.
		During auto-programming	
	Program ROM	During auto-erase (suspend enabled)	Auto-erase suspends after td(SR-SUS) and interrupt handling is executed. Auto-erase can be restarted by setting the FMR21 bit to 0 after interrupt handling completes. While auto-erase is being suspended, any block other than the block during auto-erase execution can be read or written.
		During auto-erase (suspend disabled or FMR22 = 0)	Auto-erase and auto-programming have priority and interrupt requests are put on standby. Interrupt handling is executed after auto-erase and auto-program complete.
		During auto-programming	

FMR21, FMR22: Bits in FMR2 register

**Table 28.2 CPU Rewrite Mode Interrupts (2)**

Mode	Erase/ Write Target	Status	<ul style="list-style-type: none"> <li>• Watchdog Timer</li> <li>• Oscillation Stop Detection</li> <li>• Voltage Monitor 2</li> <li>• Voltage Monitor 1</li> </ul> (Note 1)	<ul style="list-style-type: none"> <li>• Undefined Instruction</li> <li>• INTO Instruction</li> <li>• BRK Instruction</li> <li>• Single Step</li> <li>• Address Match</li> <li>• Address Break</li> </ul> (Note 1)
EW0	Data flash	During auto-erase (suspend enabled)	When an interrupt request is acknowledged, interrupt handling is executed. If the FMR22 bit is set to 1 (erase-suspend request enabled by interrupt request), the FMR21 bit is automatically set to 1 (erase-suspend request). The flash memory suspends auto-erase after td(SR-SUS). If erase-suspend is required while the FMR22 bit is set to 0 (erase-suspend request disabled by interrupt request), set the FMR21 bit to 1 during interrupt handling. The flash memory suspends auto-erase after td(SR-SUS). While auto-erase is being suspended, any block other than the block during auto-erase execution can be read or written. Auto-erase can be restarted by setting the FMR21 bit is set to 0 (erase restart).	When an interrupt request is acknowledged, interrupt handling is executed. If erase-suspend is required, set the FMR21 bit to 1 during interrupt handling. The flash memory suspends auto-erase after td(SR-SUS). While auto-erase is being suspended, any block other than the block during auto-erase execution can be read or written. Auto-erase can be restarted by setting the FMR21 bit in the FMR2 register is set to 0 (erase restart).
		During auto-erase (suspend disabled or FMR22 = 0)	Interrupt handling is executed while auto-erase or auto-programming is being performed.	
		During auto-programming		
	Program ROM	During auto-erase (suspend enabled)	When an interrupt request is acknowledged, auto-erase or auto-programming is forcibly stopped immediately and the flash memory is reset. Interrupt handling starts when the flash memory restarts after the fixed period. Since the block during auto-erase or the address during auto-programming is forcibly stopped, the normal value may not be read. After the flash memory restarts, execute auto-erase again and ensure it completes normally. The watchdog timer does not stop during the command operation, so interrupt requests may be generated. Initialize the watchdog timer regularly using the erase-suspend function.	Not usable during auto-erase or auto-programming.
		During auto-erase (suspend disabled)		
		During auto-programming		

FMR21, FMR22: Bits in FMR2 register

Note:

1. Do not use a non-maskable interrupt while block 0 is being auto-erased because the fixed vector is allocated in block 0.

**Table 28.3 CPU Rewrite Mode Interrupts (3)**

Mode	Erase/ Write Target	Status	<ul style="list-style-type: none"> <li>• Watchdog Timer</li> <li>• Oscillation Stop Detection</li> <li>• Voltage Monitor 2</li> <li>• Voltage Monitor 1</li> </ul> (Note 1)	<ul style="list-style-type: none"> <li>• Undefined Instruction</li> <li>• INTO Instruction</li> <li>• BRK Instruction</li> <li>• Single Step</li> <li>• Address Match</li> <li>• Address Break</li> </ul> (Note 1)
EW1	Data flash	During auto-erase (suspend enabled)	When an interrupt request is acknowledged, interrupt handling is executed. If the FMR22 bit is set to 1 (erase-suspend request enabled by interrupt request), the FMR21 bit is automatically set to 1 (erase-suspend request). The flash memory suspends auto-erase after td(SR-SUS). If erase-suspend is required while the FMR22 bit is set to 0 (erase-suspend request disabled by interrupt request), set the FMR21 bit to 1 during interrupt handling. The flash memory suspends auto-erase after td(SR-SUS). While auto-erase is being suspended, any block other than the block during auto-erase execution can be read or written. Auto-erase can be restarted by setting the FMR21 bit is set to 0 (erase restart).	When an interrupt request is acknowledged, interrupt handling is executed. If erase-suspend is required, set the FMR21 bit to 1 during interrupt handling. The flash memory suspends auto-erase after td(SR-SUS). While auto-erase is being suspended, any block other than the block during auto-erase execution can be read or written. Auto-erase can be restarted by setting the FMR21 bit in the FMR2 register is set to 0 (erase restart).
		During auto-erase (suspend disabled or FMR22 = 0)	Interrupt handling is executed while auto-erase or auto-programming is being performed.	
		During auto-programming		
	Program ROM	During auto-erase (suspend enabled)	When an interrupt request is acknowledged, auto-erase or auto-programming is forcibly stopped immediately and the flash memory is reset. Interrupt handling starts when the flash memory restarts after the fixed period. Since the block during auto-erase or the address during auto-programming is forcibly stopped, the normal value may not be read. After the flash memory restarts, execute auto-erase again and ensure it completes normally. The watchdog timer does not stop during the command operation, so interrupt requests may be generated. Initialize the watchdog timer regularly using the erase-suspend function.	Not usable during auto-erase or auto-programming.
		During auto-erase (suspend disabled or FMR22 = 0)		
		During auto-programming		

FMR21, FMR22: Bits in FMR2 register

Note:

1. Do not use a non-maskable interrupt while block 0 is being auto-erased because the fixed vector is allocated in block 0.

### 28.14.1.3 How to Access

To set one of the following bits to 1, first write 0 and then 1 immediately. Disable interrupts and DTC activation between writing 0 and writing 1.

- The FMR01 bit or FMR02 bit in the FMR0 register
- The FMR13 bit in the FMR1 register
- The FMR20 bit, FMR22 bit, or FMR 27 bit in the FMR2 register

To set one of the following bits to 0, first write 1 and then 0 immediately. Disable interrupts and DTC activation between writing 1 and writing 0.

- The FMR14 bit, FMR15 bit, FMR16 bit, or FMR17 bit in the FMR1 register

### 28.14.1.4 Rewriting User ROM Area

In EW0 mode, if the supply voltage drops while rewriting any block in which a rewrite control program is stored, it may not be possible to rewrite the flash memory because the rewrite control program cannot be rewritten correctly. In this case, use standard serial I/O mode.

### 28.14.1.5 Programming

Do not write additions to the already programmed address.

### 28.14.1.6 Entering Stop Mode or Wait Mode

Do not enter stop mode or wait mode during erase-suspend.

If the FST7 bit in the FST register is set to 0 (busy (during programming or erasure execution)), do not enter to stop mode or wait mode.

Do not enter stop mode or wait mode while the FMR27 bit is 1 (low-current-consumption read mode enabled).

### 28.14.1.7 Programming and Erasure Voltage for Flash Memory

To perform programming and erasure, use  $VCC = 2.7\text{ V}$  to  $5.5\text{ V}$  as the supply voltage. Do not perform programming and erasure at less than  $2.7\text{ V}$ .

### 28.14.1.8 Block Blank Check

Do not execute the block blank check command during erase-suspend.

### 28.14.1.9 Low-Current-Consumption Read Mode

In low-speed on-chip oscillator mode, the current consumption when reading the flash memory can be reduced by setting the FMR27 bit in the FMR2 register to 1 (low-current-consumption read mode enabled).

When the CPU clock is set to the low-speed on-chip oscillator clock divided by 4, 8, or 16, low-consumption-current read mode can be used. When divided by 1 (no division) or divided by 2 is set, do not use low-consumption-current read mode. After setting the divide ratio of the CPU clock, set the FMR27 bit to 1.

To reduce the power consumption, refer to **26. Reducing Power Consumption**.

Enter wait mode or stop mode after setting the FMR27 bit to 0 (low-current-consumption read mode disabled).

Do not enter wait mode or stop mode while the FMR27 bit is 1 (low-current-consumption read mode enabled).

## **28.15 Notes on Noise**

### **28.15.1 Inserting a Bypass Capacitor between VCC and VSS Pins as a Countermeasure against Noise and Latch-up**

Connect a bypass capacitor (approximately 0.1  $\mu\text{F}$ ) using the shortest and thickest wire possible.

### **28.15.2 Countermeasures against Noise Error of Port Control Registers**

During rigorous noise testing or the like, external noise (mainly power supply system noise) can exceed the capacity of the MCU's internal noise control circuitry. In such cases the contents of the port related registers may be changed.

As a firmware countermeasure, it is recommended that the port registers, port direction registers, and pull-up control registers be reset periodically. However, examine the control processing fully before introducing the reset routine as conflicts may be created between the reset routine and interrupt routines.

## 29. Notes on On-Chip Debugger

When using the on-chip debugger to develop and debug programs for the R8C/33T Group, take note of the following:

- (1) Some of the user flash memory and RAM areas are used by the on-ship debugger. These areas cannot be accessed by the user.  
Refer to the on-chip debugger manual for which areas are used.
- (2) Do not set the address match interrupt (registers AIER0, AIER1, RMAD0, and RMAD1 and fixed vector tables) in a user system.
- (3) Do not use the BRK instruction in a user system.
- (4) Debugging is available under the condition of supply voltage  $VCC = 1.8\text{ V}$  to  $5.5\text{ V}$ . Set the supply voltage to  $2.7\text{ V}$  or above for rewriting the flash memory.

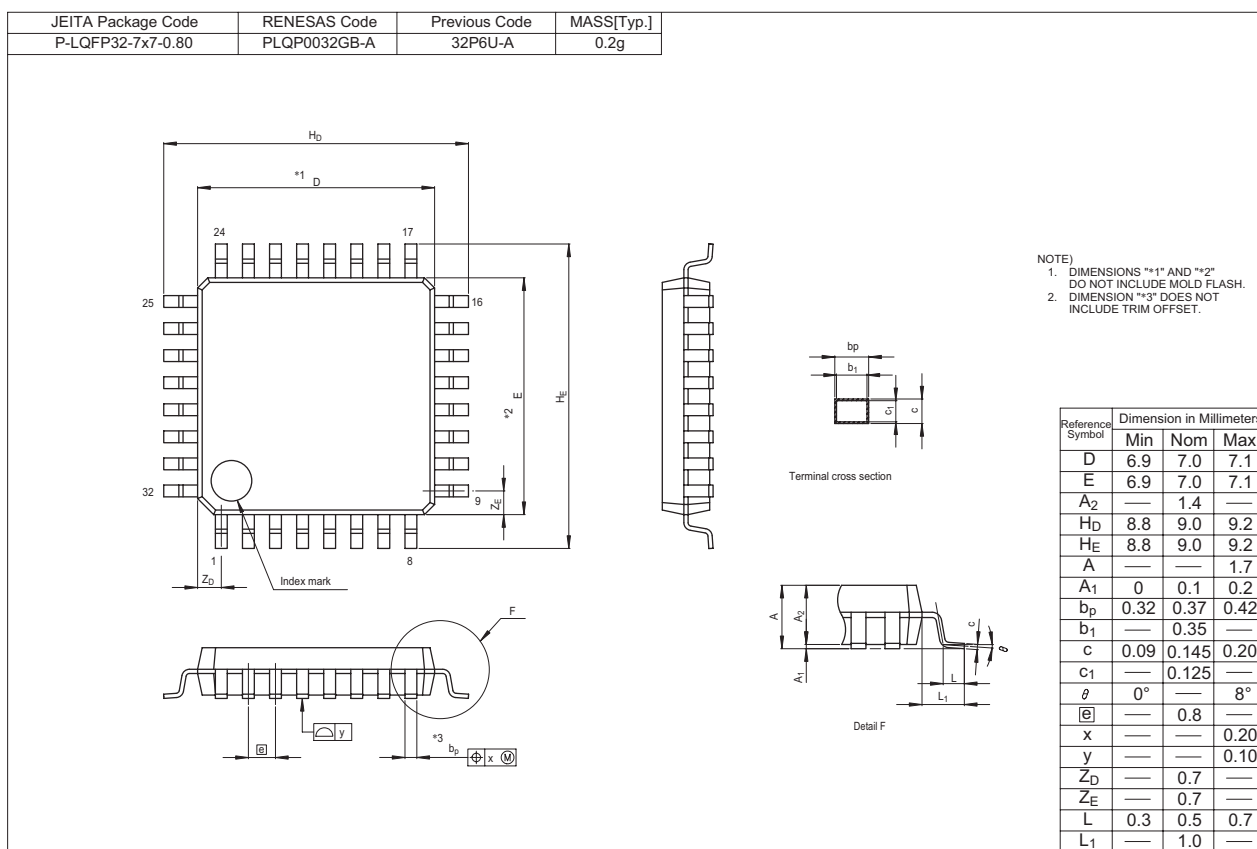

Connecting and using the on-chip debugger has some special restrictions. Refer to the on-chip debugger manual for details.

## 30. Notes on Emulator Debugger

Connecting and using the emulator debugger has some special restrictions. Refer to the emulator debugger manual for details.

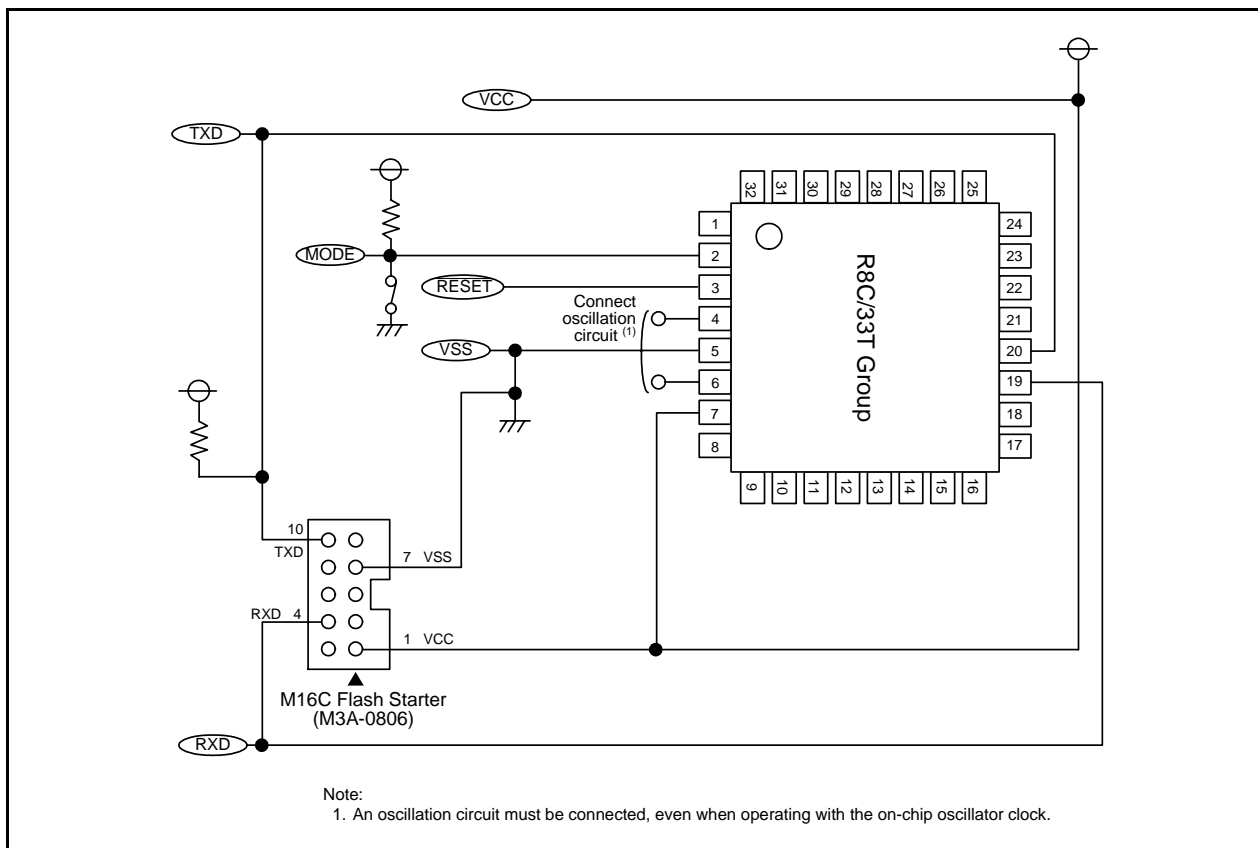

## Appendix 1. Package Dimensions

Diagrams showing the latest package dimensions and mounting information are available in the “Packages” section of the Renesas Technology website.

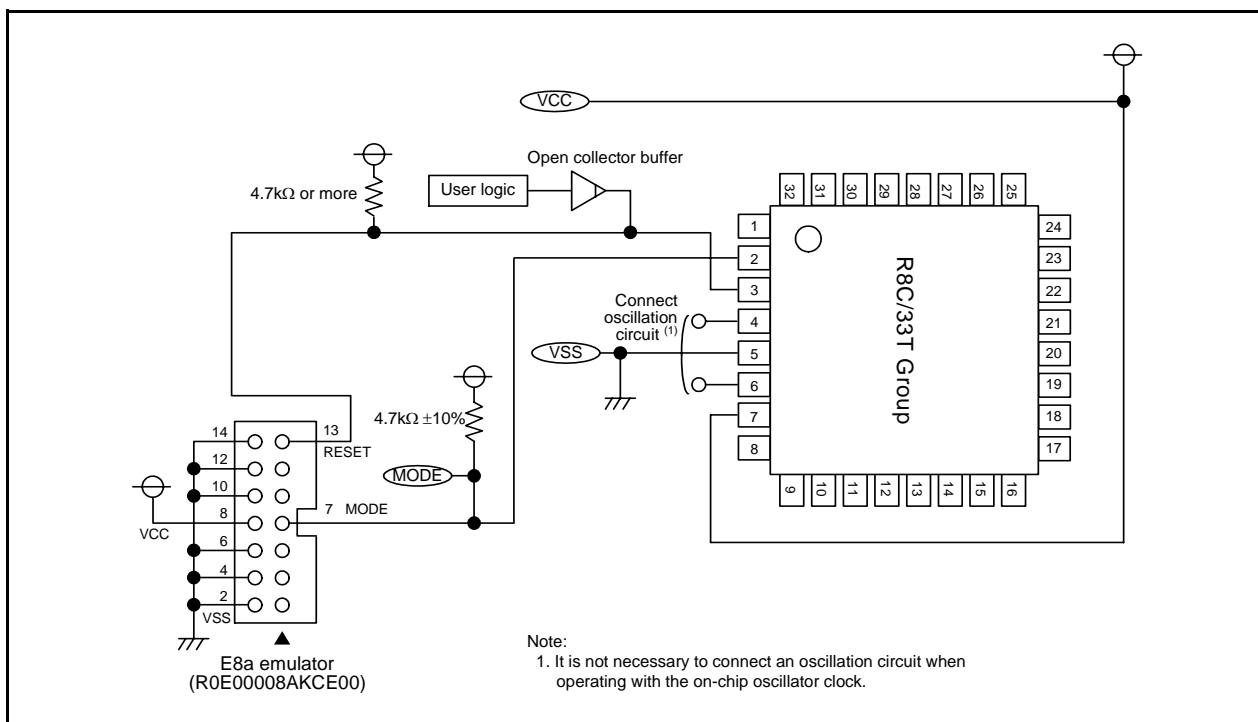

## Appendix 2. Connection Examples between Serial Programmer and On-Chip Debugging Emulator

Appendix Figure 2.1 shows a Connection Example with M16C Flash Starter (M3A-0806) and Appendix Figure 2.2 shows a Connection Example with E8a Emulator (R0E00008AKCE00).

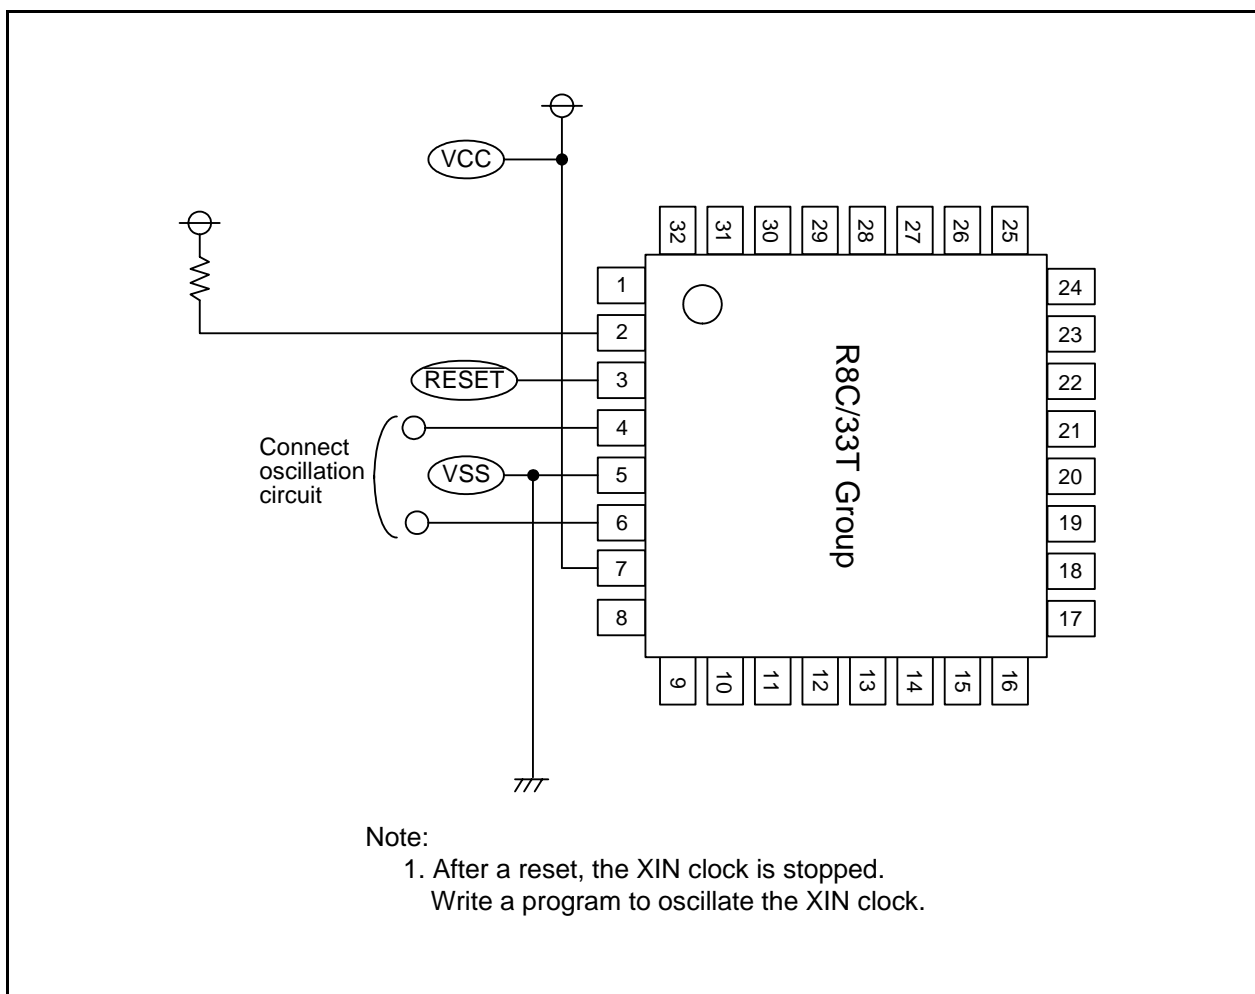

Appendix Figure 2.1 Connection Example with M16C Flash Starter (M3A-0806)

Appendix Figure 2.2 Connection Example with E8a Emulator (R0E00008AKCE00)

## Appendix 3. Example of Oscillation Evaluation Circuit

Appendix Figure 3.1 shows an Example of Oscillation Evaluation Circuit.

Appendix Figure 3.1 Example of Oscillation Evaluation Circuit

REVISION HISTORY	R8C/33T Group Hardware Manual
------------------	-------------------------------

Rev.	Date	Description	
		Page	Summary
0.10	Jul 07, 2009	—	First Edition issued
1.00	Mar 16, 2010	All pages	“Preliminary” “Preliminary specification” “Under development” deleted
		4	Table 1.3, Figure 1.1 revised
		8	Table 1.5 Note 2 deleted
		12	Figure 3.1 revised
		31	5.2 “, Figure 5.2 ...” added
		35	5.5 “while writing to the internal RAM is in progress,” added
		38, 40	Figure 6.1, Figure 6.4 revised
		41	6.2.1 Note 1, Note 2 added
		43, 45, 119	6.2.4, 6.2.6, 9.2.14 “After Reset” notation revised
		46, 47	6.2.7, 6.2.8 Note 2 revised, Note 6 added
		51, 53	6.5, 6.6 Note 3 revised
		66	Figure 7.10 revised
		77, 157, 302, 331	7.4.13, 11.4.3, 20.2.9, 21.2.15 Note 1 “When writing 1 to the LVMPR bit, ...” added
		104, 105	Table 7.31 to 7.33 revised
		106, 160, 317, 368	7.6, 11.5, 20.5, 21.8 “When low-voltage signal mode is used, ...” added
		108	8, Table 8.2 “, DTC vector area, DTC control data” added
		113	9.2.2 Note 6 added
		121	Figure 9.4 Note 2 added
		123	9.5.5 “3.0 V” → “2.7 V”
		126	9.6.1.3 revised
		127	9.6.2.2 “Enter wait mode after ...” added
		131	9.6.3.1 “Enter stop mode after ...” added
		138, 503	9.8.1, 9.8.2, 28.1.1, 28.1.2 revised
		140	10.1.1 Note 1 revised, Note 2 added
		144	Table 11.1 “0FFE7h is FFh ...” → “0FFE6h is FFh ...”
		156	11.4.1 “The $\overline{\text{INT2}}$ pin ...” added, Table 11.6 “, timer RA ...” added
		158	11.4.4 “INTiPL bit” → “INTEN register”
		168, 506	Figure 11.12, Figure 28.1 Note 3 revised
		181	14.2.5 revised
		191	15.2.7 Note 1 added
		202	15.3.8 “four” → “five”
		208	Figure 17.1 revised
		217	17.5.1 “compare match signal” → “output”
		222	17.7.1 revised
		224	17.8 revised
		225	Figure 18.1 revised

REVISION HISTORY	R8C/33T Group Hardware Manual
------------------	-------------------------------

Rev.	Date	Description	
		Page	Summary
1.00	Mar 16, 2010	227	18.2.4 Note 3 added
		236, 240, 242	Table 18.4, Table 18.5, Figure 18.5 "INT0 one-shot ..." → "INT0 pin one-shot ..."
		238	Figure 18.4 revised
		243, 511	18.7, 28.7 "• To use the underflow signal of ..." added
		288	Table 19.14 "(1)" added
		294, 514	19.9.5, 28.8.5 revised
		300	20.2.6 Note 1 "When setting ..." added, Note 2 added
		307	20.3.1 revised
		310	Table 20.5 Note 2 added
		316	20.4.2 revised
		319	Figure 21.1 revised
		320	21.2.6 "0" → "undefined", Note 1 "When setting ..." added
		336	21.3.1 revised
		339	Table 21.5 Note 2 revised
		341	Table 21.7 "PD3_4 bit in PD3 register = 0" added
		342	Figure 21.7 revised
		344	21.4.2 revised
		349	Table 21.10 revised
		370, 517	21.9.2, 21.9.2.1, 21.9.2.2, 28.10.2, 28.10.2.1, 28.10.2.2 deleted
		371	22.1 revised
		372	Table 22.1 Note 1 revised, Note 2 added
		376, 379	Figure 22.3, Figure 22.6 Note 2 added
		381	Figure 22.8 revised
		386	Table 23.1 Note 2 revised
		393	23.2.6 revised
		398	23.3.6 "Extended Analog Input Pins" → "On-Chip Reference Voltage ..."
		409, 518	23.10, 28.12 revised
		412	Table 24.1 revised
		413	24.2.1 b6 revised
		425, 426	24.2.14, 24.2.15 "R/W" → "R"
		427, 428	24.2.16, 24.2.18 "In scan mode, ..." added
		430	Table 24.10 revised
		434	Table 24.12 "Refer to ..." added
		439, 519	24.5.2, 28.13.2 "• When the sensor ..." added 24.5.5, 28.13.5 added
		440	Table 25.1 "8 commands" → "7 commands"
		443	25.3.2 revised
		444	25.4 revised, Table 25.3 "Max." added

REVISION HISTORY	R8C/33T Group Hardware Manual
------------------	-------------------------------

Rev.	Date	Description	
		Page	Summary
1.00	Mar 16, 2010	445, 446	25.4.1 revised
		447, 448	25.4.2 revised
		449	25.4.3 revised
		451, 452	25.4.4 revised
		453	25.4.5 revised
		454	25.4.7 “• To check the suspend, ...” added
		455	Figure 25.4, Figure 25.5 Note 1 revised
		456	25.4.9 “Any other block of ...” added
		457	25.4.10 revised
		458	25.4.11 “Do not input ...” added
		459, 460	Figure 25.8, Figure 25.9 revised
		462 to 465	Figure 25.11 to 25.14 revised
		466	25.4.11.7 “This command ...” “This commanded ...”added, Figure 25.15 revised
		467	Table 25.6 revised
		473 to 475	Table 25.9 to 25.11, Table 28.1 to 28.3 revised
		520 to 522	
		476, 523	25.7.1.3, 25.7.1.6, 28.14.1.3, 28.14.1.6 revised 25.7.1.9, 28.14.1.9 added
		480	26.2.10, Figure 26.3 revised
		483	Table 27.2 revised
		485	Table 27.3 revised
		486, 487	Table 27.4, Table 27.5, Figure 27.2 revised
		488	Table 27.6, Table 27.7 revised
		489	Table 27.8, Table 27.9 revised
		490	Table 27.10 revised, Note 2 deleted
		491, 495, 499	Table 27.13, Table 27.19, Table 27.25, revised
		492, 496, 500	Table 27.14, Table 27.20, Table 27.26 revised
		493	Table 27.15, Figure 27.4 revised
		497	Table 27.21, Figure 27.8 revised
		501	Table 27.27, Figure 27.12 revised
		526	30. Notes on Emulator Debugger added
